

allocation

CPU

2 main objectives

## TYPES OF O.S

① Batch O.S (1960s)

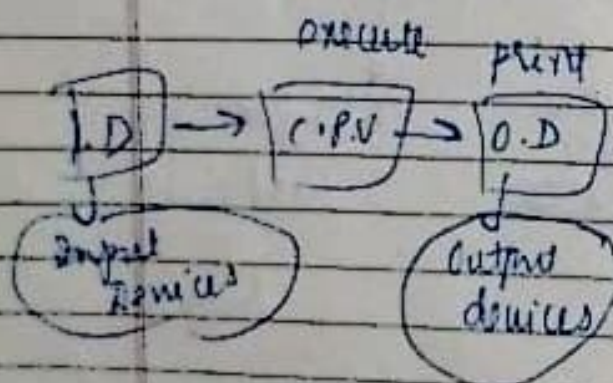

organisation

Computer system → Operated by Operator

↓  
Run

Data by a person who can run computer

↳ Batch wise operation of tasks

At a time one used to work

1. When I.D is busy C.P.U and O.D is not busy.
2. Then if C.P.U is busy then I.D & O.D are idle.

# # 1

## OS (operating system)

↓  
Introduction  
what is OS

→ 1 diagram  
comp block  
diagram

↓  
4 definitions  
Tushar and me

# # 2

Objectives of O.S — hardware

burden transfer  
to computer

↓  
human  
convenience  
no debugging

AIM  
↓  
human comfort.

O.S  
and other System  
Software  
↓  
Service  
Driver

↓  
inter face b/w  
hardware  
&  
human

human - ~~hardware~~  
↓  
System software  
OS

direction of magnetisation is read by magnetic reader  
→ so direction given randomly 1 or 0  
if CPU has processed and OP is busy

magnetic materials going under in past cell  
→ so readily output process can also be queued in Disc

plastic ribbon with magnetic material (ferric oxide)

Dispatched directly from Disc

Tape ~~is~~ is sequential memory

That is why not use Disc and tape

Disc - Random Access

↓  
kahi par  
read karlo  
kahi par  
write  
karlo

magnetic  
Disc

Peterson  
chapter 8

Page No.	
Date	

3. If O.D is busy, I.D and CPU idle

Output

(then punching)

DRAWBACK

No interaction  
with user and  
process

Day 1: 1+2 for  
2+3 will need  
to come on

DISC TECHNOLOGY

a batch then within  
Then we do one  
job. Job 1 in I.D then  
it goes to CPU, so  
simultaneously  
we can  
insert Job 2  
in I.D then  
Job 2 in CPU.  
Job 1 in O.D  
Job 3 in I.D

Spooling

Then is the  
arise in changing  
from batch 1 and  
batch 2. Then time  
wasted

many Jobs inserted and queue  
formed in Disc  
so do we busy CPU  
buffer is formed at Disc.

→ Already passed

ape

To analyse it again we need to

re wind tape.

B: Bytes  
b: bits

For songs in ab time

Take fast forward or re wind.

Read write head

SSD

chip form

Magnetic Disc

(512 B)

Head assembly  
by lower surface

by upper surface

sector : some storage  
→ density inside  
↑  
→ density out side  
↓  
access of written to a disc

smallest memory

Search time + Rotational latency

+ Transfer Time

= ACCESS TIME

Depends on transfer rate.

SSD OVER HDD

as search time & rotational latency is avoided

Advantage in backup

Tape length - kitni bhi ho sakti hai  
low cost

Disc ka stack banata rahunga.

Disc ka size changed in advance

hard  
dis

magnetic disc and other  
~~massing~~ ~~CD~~ ~~statts~~  
↓  
with minor  
gaps  
↓  
to prevent  
scratch  
and  
requirement  
of head inside  
head.

Search Time - Time  
to search  
the desired  
track

Time  
waste

↓

desired track  
is inside so time  
will take more

Rotational Latency - Time  
one desired track  
less than  
sector rotation  
required for  
the desired track  
to reach under  
head.

# O.S. concepts

E-books latest addition.

↓  
But tape can  
be changed  
in advanced

↓  
Tape has to be seen one time  
and completely  
like a movie

disc is for navigating  
multiple song  
at random.

{  
② Multi programmed  
③ Multitasking / Time sharing  
} diff

1 ques of 1 then 1 ques for  
2 then 1 ques for 3  
- . . . 1 ques for 5.

By-the-time stud 1 prepare  
to ask ques 2 comp CP is  
so fast that it has dealt with  
each student. So student 1 become

→ full server's (CPU's) abundance.

↓  
works only till a certain limit

If no. of students become so much

of 5, then CPU will take time to return back to student 1.

↓  
a site crash during exam results.

# Response Time

↳ Time interval

b/w summation  
of job

and its  
response

Ideally  
Response  
time should  
be 0.

Itni zyada  
response  
time  
due to  
zyada  
jobs

student 1

5 ques  
each

Person

1 ke saare ~~ques~~  
ques. ~~ques~~ solve  
kiya

for 2 ke saare kiya

for  
3 rd ke saare kiya

!

for 4 ke saare kiya

So the  
person  
at last  
has to  
wait a  
lot.

↓  
Response  
time  
increases

ques of the ~~cpu~~ realise ~~cpu~~ absence. Also host of other students don't

#3

Page No.

Date

System ~~output~~ behaviour

file operating system

can't interact with OS.

Can't change ~~output~~ <sup>input</sup>  
based on ~~output~~ <sup>output</sup>.

1D

CPU

OD

The

like buffers.

Disc advantage

Random Access

disc as a buffer

write in ~~OD~~ disc..

so even if 1D and CPU all fast

but output will not be produced if the slow OD

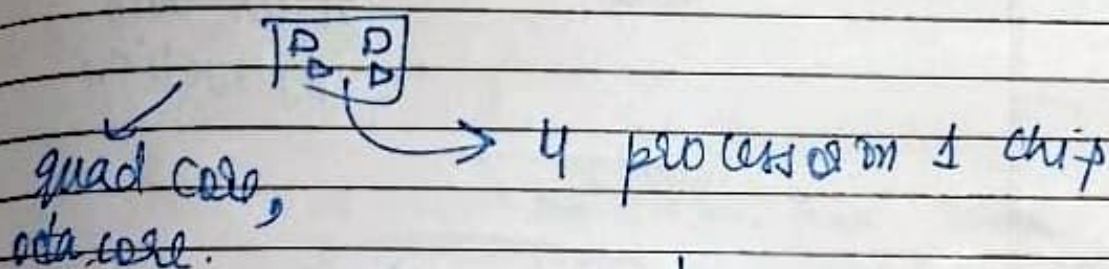

Similarly if CPU is slow then

OD will sit idle.

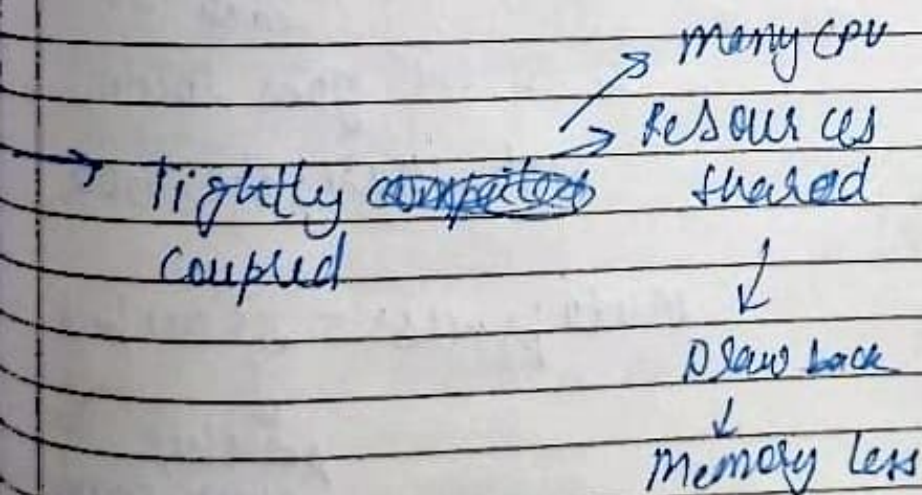

A processor on 1 chip

↓  
MULTI PROCESSOR

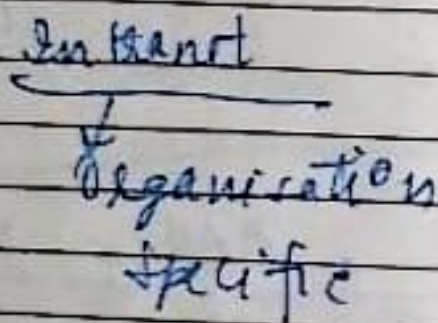

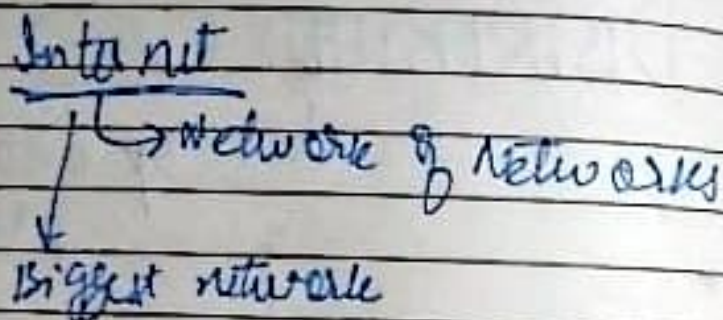

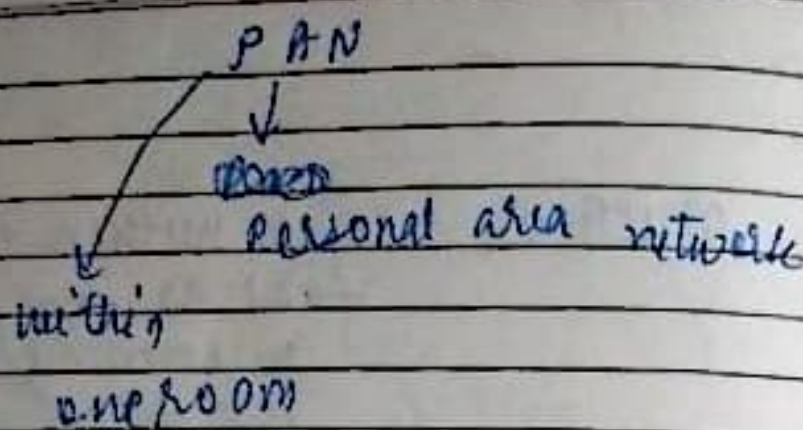

↓  
MULTI CORE

Disadvantage - costly to buy ~~process~~

↓  
Suppose main  
campus & east  
campus.

TCS - all over world  
all computers.

✓ Extranet

↓  
some features  
by outside world  
by registration.

✓ Ultraneet

↓  
massive online  
course  
(MOOCs) online learning

Infotechs company  
computer all  
over the world

↓  
Internet  
& WAN

Request form by  
nearest server

Advantage → Info update  
→ Reliability (backups)

→ loosely coupled →

If server down  
it acts as  
server

## asymmetric

like  
hierarchy

one master process or

best  
man

all slaves

gives them  
instruction

## Symmetric

competition

one process keeps eye on rest  
all. All keep eye on  
each

so if one goes down  
rest share the work.

multi process - draw back

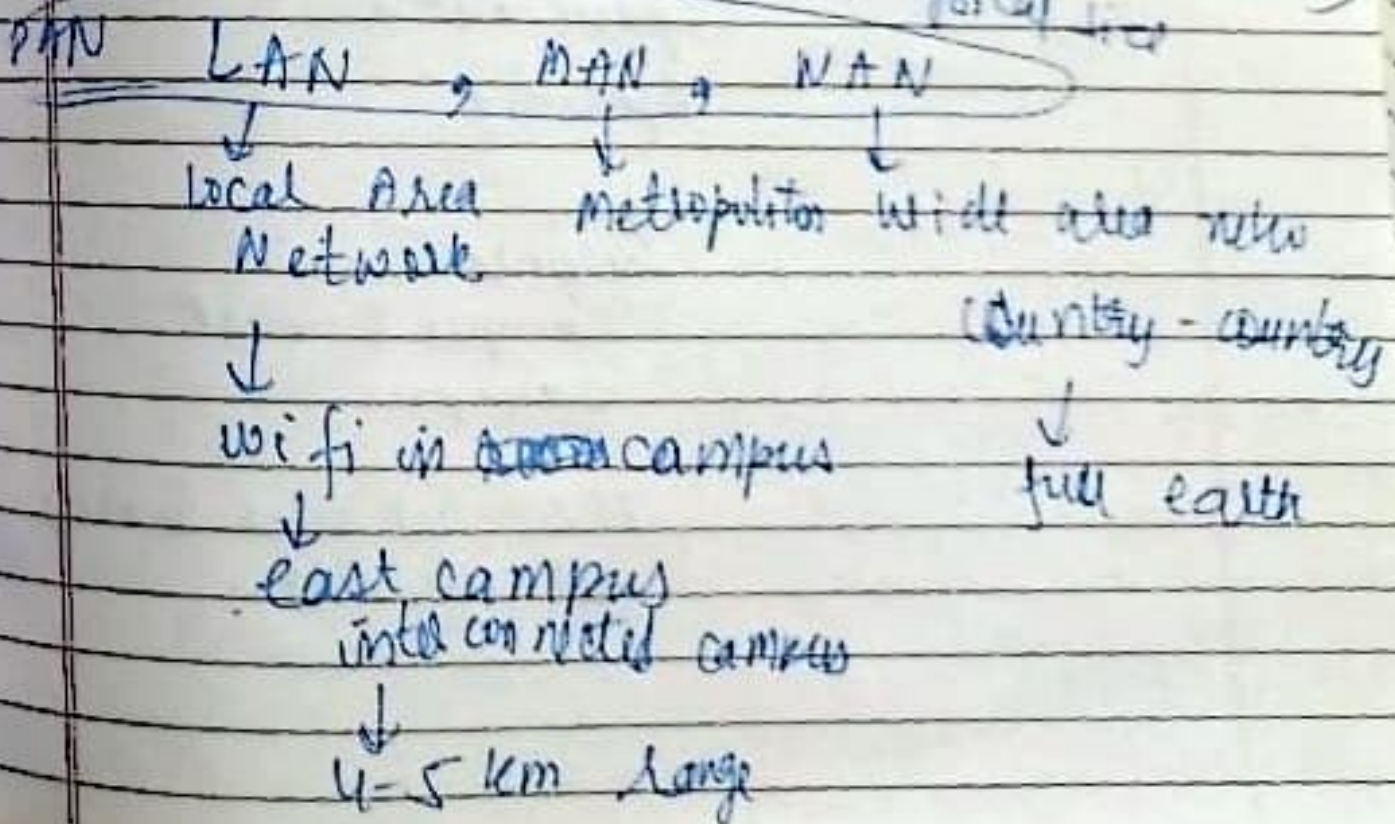

per chip  
power consumption  
is less

Power consumption  
is less in multi

Multicore - Comm within chip is fast as compared to communication b/w chips (multi processors)

# DISTRIBUTED O.S

↳ up until now processors were in one system  
 ↳ Now processors are separate (In Delhi, Mumbai, etc.)  
 Physical dist

→ Lab apne apne terminal ke saath hai.

— Computation speed up

## EMBEDDED OS SYSTEM

- ↳ In washing machine
- ↳ mechanical
- ↳ nuclear submarine
- ↳ Combn electronic & mechanical

→ combination: Embedded system works in real time

## REAL TIME

- ↳ Timer 30 sec
- ↳ So it should not start after 1 hour
- ↳ Tab kaha tab start hua

Alert  
Time

No  
delay in  
of 2 or 3 sec

missile  
launch.

Soft  
Time

flashing

call, video phone
