

PROBLEMS 26.3

- In a certain college, 4% of the boys and 1% of girls are taller than 1.8 m. Further more 60% of the students are girls. If a student is selected at random and is found to be taller than 1.8 m., what is the probability that the student is a girl?
 - In a bolt factory, machines A, B and C manufacture 25%, 35% and 40% of the total. Of their output 5%, 4% and 2% are defective bolts. A bolt is drawn at random from the product and is found to be defective. What are the probabilities that it was manufactured by machines A, B or C? (V.T.U., 2006; Rohtak, 2005; Madras, 2000 S)
 - In a bolt factory, there are four machines A, B, C, D manufacturing 20%, 15%, 25% and 40% of the total output respectively. Of their outputs 5%, 4%, 3% and 2% in the same order are defective bolts. A bolt is chosen at random from the factory's production and is found defective. What is the probability that the bolt was manufactured by machine A or machine D?
 - The contents of three urns are : 1 white, 2 red, 3 green balls ; 2 white, 1 red, 1 green balls and 4 white, 5 red, 3 green balls. Two balls are drawn from an urn chosen at random. These are found to be one white and one green. Find the probability that the balls so drawn came from the third urn.
- (Hissar, 2007; J.N.T.U., 2003)
(Kurukshetra, 2007)

26.7 RANDOM VARIABLE

If a real variable X be associated with the outcome of a random experiment, then since the values which X takes depend on chance, it is called a *random variable* or a *stochastic variable* or simply a *variate*. For instance, if a random experiment E consists of tossing a pair of dice, the sum X of the two numbers which turn up have the value 2, 3, 4, ..., 12 depending on chance. Then X is the random variable. It is a function whose values are real numbers and depend on chance.

If in a random experiment, the event corresponding to a number a occurs, then the corresponding random variable X is said to assume the value a and the probability of the event is denoted by $P(X = a)$. Similarly the probability of the event X assuming any value in the interval $a < X < b$ is denoted by $P(a < X < b)$. The probability of the event $X \leq c$ is written as $P(X \leq c)$.

If a random variable takes a finite set of values, it is called a *discrete variate*. On the other hand, if it assumes an infinite number of uncountable values, it is called a *continuous variate*.

26.8 (1) DISCRETE PROBABILITY DISTRIBUTION

Suppose a discrete variate X is the outcome of some experiment. If the probability that X takes the values x_i is p_i , then

$$P(X = x_i) = p_i \text{ or } p(x_i) \text{ for } i = 1, 2, \dots$$

where (i) $p(x_i) \geq 0$ for all values of i , (ii) $\sum p(x_i) = 1$

The set of values x_i with their probabilities p_i constitute a **discrete probability distribution** of the discrete variate X .

For example, the discrete probability distribution for X , the sum of the numbers which turn on tossing a pair of dice is given by the following table :

$X = x_i$	2	3	4	5	6	7	8	9	10	11	12
$p(x_i)$	1/36	2/36	3/36	4/36	5/36	6/36	5/36	4/36	3/36	2/36	1/36

[\therefore There are $6 \times 6 = 36$ equally likely outcomes and therefore, each has the probability $1/36$. We have $X = 2$ for one outcome, i.e. (1, 1); $X = 3$ for two outcomes (1, 2) and (2, 1); $X = 4$ for three outcomes (1, 3), (2, 2) and (3, 1) and so on.]

(2) Distribution function. The distribution function $F(x)$ of the discrete variate X is defined by

$$F(x) = P(X \leq x) = \sum_{i=1}^x p(x_i) \text{ where } x \text{ is any integer. The graph of } F(x) \text{ will be}$$

stair step form (Fig. 26.2). The distribution function is also sometimes called *cumulative distribution function*.

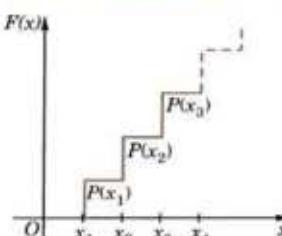

Fig. 26.2

Example 26.28. A die is tossed thrice. A success is 'getting 1 or 6' on a toss. Find the mean and variance of the number of successes. (V.T.U., 2011 S; Rohtak, 2004)

Solution. Probability of a success = $\frac{2}{6} = \frac{1}{3}$, Probability of failure = $1 - \frac{1}{3} = \frac{2}{3}$.

$$\therefore \text{prob. of no success} = \text{Prob. of all 3 failures} = \frac{2}{3} \times \frac{2}{3} \times \frac{2}{3} = \frac{8}{27}$$

$$\text{Probability of one success and 2 failures} = 3c_1 \times \frac{1}{3} \times \frac{2}{3} \times \frac{2}{3} = \frac{4}{9}$$

$$\text{Probability of two successes and one failure} = 3c_2 \times \frac{1}{3} \times \frac{1}{3} \times \frac{2}{3} = \frac{2}{9}$$

$$\text{Probability of three successes} = \frac{1}{3} \times \frac{1}{3} \times \frac{1}{3} = \frac{1}{27}$$

Now	$x_i = 0$	1	2	3
	$p_i = 8/27$	$4/9$	$2/9$	$1/27$

$$\therefore \text{mean } \mu = \sum p_i x_i = 0 + \frac{4}{9} + \frac{4}{9} + \frac{1}{9} = 1.$$

$$\text{Also } \sum p_i x_i^2 = 0 + \frac{4}{9} + \frac{8}{9} + \frac{9}{27} = \frac{5}{3}$$

$$\therefore \text{variance } \sigma^2 = \sum p_i x_i^2 - \mu^2 = \frac{5}{3} - 1 = \frac{2}{3}.$$

Example 26.29. The probability density function of a variate X is

$X :$	0	1	2	3	4	5	6
$p(X) :$	k	$3k$	$5k$	$7k$	$9k$	$11k$	$13k$

$$(i) \text{Find } P(X < 4), P(X \geq 5), P(3 < X \leq 6).$$

(V.T.U., 2010)

$$(ii) \text{What will be the minimum value of } k \text{ so that } P(X \leq 2) > 3.$$

Solution. (i) If X is a random variable, then

$$\sum_{i=0}^6 p(x_i) = 1 \text{ i.e., } k + 3k + 5k + 7k + 9k + 11k + 13k = 1 \text{ or } k = 1/49.$$

$$\therefore P(X < 4) = k + 3k + 5k + 7k = 16k = 16/49.$$

$$P(X \geq 5) = 11k + 13k = 24k = 24/49.$$

$$P(3 < X \leq 6) = 9k + 11k + 13k = 33k = 33/49.$$

$$(ii) P(X \leq 2) = k + 3k + 5k = 9k > 0.3 \text{ or } k > 1/30$$

Thus minimum value of k = $1/30$.

Example 26.30. A random variable X has the following probability function :

$x :$	0	1	2	3	4	5	6	7
$p(x) :$	0	k	$2k$	$2k$	$3k$	k^2	$2k^2$	$7k^2 + k$

$$(i) \text{Find the value of the } k$$

$$(ii) \text{Evaluate } P(X < 6), P(X \geq 6)$$

$$(iii) P(0 < X < 5)$$

(W.B.T.U., 2005; J.N.T.U., 2003)

Solution. (i) If X is a random variable, then

$$\sum_{i=0}^7 p(x_i) = 1, \text{ i.e., } 0 + k + 2k + 2k + 3k + k^2 + 2k^2 + 7k^2 + k = 1$$

$$\text{i.e., } 7k^2 + 9k - 1 = 0 \text{ i.e. } (10 - k)(k + 1) = 0 \text{ i.e., } k = \frac{1}{10}$$

$$(ii) P(X < 6) = P(X = 0) + P(X = 1) + P(X = 2) + P(X = 3) + P(X = 4) + P(X = 5)$$

$$= 0 + k + 2k + 2k + 3k + k^2 = 8k + k^2 = \frac{8}{10} + \frac{1}{100} = \frac{81}{100}$$

$$P(X \geq 6) = P(X = 6) + P(X = 7) = 2k^2 + 7k^2 + k = \frac{9}{100} + \frac{1}{10} = \frac{19}{100}$$

$$(ii) P(0 < X < 5) = P(X = 1) + P(X = 2) + P(X = 3) + P(X = 4)$$

$$= k + 2k + 2k + 3k = 8k = \frac{8}{10} = \frac{4}{5}.$$

26.9 (1) CONTINUOUS PROBABILITY DISTRIBUTION

When a variate X takes every value in an interval, it gives rise to *continuous distribution* of X . The distributions defined by the variates like heights or weights are continuous distributions.

A major conceptual difference, however, exists between discrete and continuous probabilities. When thinking in discrete terms, the probability associated with an event is meaningful. With continuous events, however, where the number of events is infinitely large, the probability that a specific event will occur is practically zero. For this reason, continuous probability statements must be worded somewhat differently from discrete ones. Instead of finding the probability that x equals some value, we find the probability of x falling in a small interval.

Thus the probability distribution of a continuous variate x is defined by a function $f(x)$ such that the probability of the variate x falling in the small interval $x - \frac{1}{2} dx$ to $x + \frac{1}{2} dx$ is $f(x) dx$. Symbolically it can be expressed as $P\left(x - \frac{1}{2} dx \leq x \leq x + \frac{1}{2} dx\right) = f(x) dx$. Then $f(x)$ is called the *probability density function* and the continuous curve $y = f(x)$ is called the *probability curve*.

The range of the variable may be finite or infinite. But even when the range is finite, it is convenient to consider it as infinite by supposing the density function to be zero outside the given range. Thus if $f(x) = \phi(x)$ be the density function denoted for the variate x in the interval (a, b) , then it can be written as

$$\begin{aligned}f(x) &= 0, & x < a \\&= \phi(x), & a \leq x \leq b \\&= 0, & x > b.\end{aligned}$$

The density function $f(x)$ is always positive and $\int_{-\infty}^{\infty} f(x) dx = 1$ (i.e., the total area under the probability curve and the x -axis is unity which corresponds to the requirements that the total probability of happening of an event is unity).

(2) Distribution function

$$\text{If } F(x) = P(X \leq x) = \int_{-\infty}^x f(x) dx,$$

then $F(x)$ is defined as the **cumulative distribution function** or simply the **distribution function** of the continuous variate X . It is the probability that the value of the variate X will be $\leq x$. The graph of $F(x)$ in this case is as shown in Fig. 26.3(b).

The distribution function $F(x)$ has the following properties :

- (i) $F'(x) = f(x) \geq 0$, so that $F(x)$ is a non-decreasing function.
- (ii) $F(-\infty) = 0$; $F(\infty) = 1$

$$(iv) P(a \leq x \leq b) = \int_a^b f(x) dx = \int_{-\infty}^b f(x) dx - \int_{-\infty}^a f(x) dx = F(b) - F(a).$$

Example 26.31. (i) Is the function defined as follows a density function?

$$\begin{aligned}f(x) &= e^{-x}, & x \geq 0 \\&= 0, & x < 0.\end{aligned}$$

(ii) If so, determine the probability that the variate having this density will fall in the interval $(1, 2)$?

(iii) Also find the cumulative probability function $F(2)$?

Solution. (i) $f(x)$ is clearly ≥ 0 for every x in $(1, 2)$ and

$$\int_{-\infty}^{\infty} f(x) dx = \int_0^0 0 \cdot dx + \int_0^{\infty} e^{-x} dx = 1$$

Hence the function $f(x)$ satisfies the requirements for a density function.

$$(ii) \text{ Required probability} = P(1 \leq x \leq 2) = \int_1^2 e^{-x} dx = e^{-1} - e^{-2} = 0.368 - 0.135 = 0.233.$$

This probability is equal to the shaded area in Fig. 26.3 (a).

(iii) Cumulative probability function $F(2)$

$$\int_{-\infty}^2 f(x) dx = \int_{-\infty}^0 0 \cdot dx + \int_0^2 e^{-x} dx = 1 - e^{-2} = 1 - 0.135 = 0.865$$

which is shown in Fig. 26.3 (b).

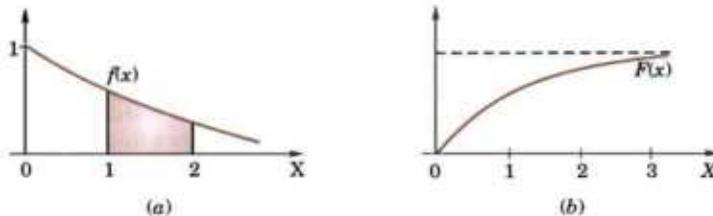

Fig. 26.3

26.10 (1) EXPECTATION

The mean value (μ) of the probability distribution of a variate X is commonly known as its **expectation** and is denoted by $E(X)$. If $f(x)$ is the probability density function of the variate X , then

$$\sum_i x_i f(x_i) \quad (\text{discrete distribution})$$

or $E(X) = \int_{-\infty}^{\infty} xf(x) dx \quad (\text{continuous distribution})$

In general, expectation of any function $\phi(x)$ is given by

$$E[\phi(x)] = \sum_i \phi(x_i) f(x_i) \quad (\text{discrete distribution})$$

or $E[\phi(x)] = \int_{-\infty}^{\infty} \phi(x) f(x) dx \quad (\text{continuous distribution})$

(2) **Variance of a distribution** is given by

$$\sigma^2 = \sum_i (x_i - \mu)^2 f(x_i) \quad (\text{discrete distribution})$$

or $\sigma^2 = \int_{-\infty}^{\infty} (x - \mu)^2 f(x) dx \quad (\text{continuous distribution})$

where σ is the **standard deviation** of the distribution.

(3) The **rth moment about the mean** (denoted by μ_r) is defined by

$$\mu_r = \sum_i (x_i - \mu)^r f(x_i) \quad (\text{discrete distribution})$$

or $\mu_r = \int_{-\infty}^{\infty} (x - \mu)^r f(x) dx \quad (\text{continuous distribution})$

(4) **Mean deviation from the mean** is given by

$$\sum |x_i - \mu| f(x_i) \quad (\text{discrete distribution})$$

or by $\int_{-\infty}^{\infty} |x - \mu| f(x) dx \quad (\text{continuous distribution})$

Example 26.32. In a lottery, m tickets are drawn at a time out of n tickets numbered from 1 to n . Find the expected value of the sum of the numbers on the tickets drawn.

Solution. Let x_1, x_2, \dots, x_n be the variables representing the numbers on the first, second, ..., n th ticket. The probability of drawing a ticket out of n tickets being in each case $1/n$, we have

$$E(x_i) = 1 \cdot \frac{1}{n} + 2 \cdot \frac{1}{n} + 3 \cdot \frac{1}{n} + \dots + n \cdot \frac{1}{n} = \frac{1}{2} (n+1)$$

∴ expected value of the sum of the numbers on the tickets drawn

$$\begin{aligned} &= E(x_1 + x_2 + \dots + x_m) = E(x_1) + E(x_2) + \dots + E(x_m) \\ &= mE(x_i) = \frac{1}{2} m (n+1). \end{aligned}$$

Example 26.33. X is a continuous random variable with probability density function given by

$$\begin{aligned} f(x) &= kx \quad (0 \leq x < 2) \\ &= 2k \quad (2 \leq x < 4) \\ &= -kx + 6k \quad (4 \leq x < 6) \end{aligned}$$

Find k and mean value of X .

(J.N.T.U., 2003)

Solution. Since the total probability is unity

$$\therefore \int_0^6 f(x) dx = 1$$

$$\text{i.e., } \int_0^2 kx dx + \int_2^4 2kdx + \int_4^6 (-kx + 6k) dx = 1$$

$$\text{or } k \left[x^2/2 \right]_0^2 + 2k \left[x \right]_2^4 + \left(-kx^2/2 + 6kx \right)_4^6 = 1$$

$$\text{or } 2k + 4k + (-10k + 12k) = 1 \text{ i.e., } k = 1/8.$$

$$\begin{aligned} \text{Mean of } X &= \int_0^6 x f(x) dx \\ &= \int_0^2 kx^2 dx + \int_2^4 2kx dx + \int_4^6 x (-kx + 6k) dx \\ &= k \left[x^3/3 \right]_0^2 + 2k \left[x^2/2 \right]_2^4 + \left(-k \left[x^3/3 \right]_4^6 + 6k \left[x^2/2 \right]_4^6 \right) \\ &= k (8/3) + k (12) - k (152/3) + 3k (20) = \frac{1}{8} (24) = 3. \end{aligned}$$

Example 26.34. A variate X has the probability distribution

x	:	-3	6	9
$P(X=x)$:	1/6	1/2	1/3

Find $E(X)$ and $E(X^2)$. Hence evaluate $E(2X+1)^2$.

Solution.

$$E(X) = -3 \times \frac{1}{6} + 6 \times \frac{1}{2} + 9 \times \frac{1}{3} = 11/2.$$

$$E(X^2) = 9 \times \frac{1}{6} + 36 \times \frac{1}{2} + 81 \times \frac{1}{3} = 93/2$$

$$\begin{aligned} E(2X+1)^2 &= E(4X^2 + 4X + 1) = 4E(X^2) + 4E(X) + 1 \\ &= 4(93/2) + 4(11/2) + 1 = 209. \end{aligned}$$

Example 26.35. The frequency distribution of a measurable characteristic varying between 0 and 2 is as under

$$\begin{aligned} f(x) &= x^3, \quad 0 \leq x \leq 1 \\ &= (2-x)^3, \quad 1 \leq x \leq 2. \end{aligned}$$

Calculate the standard deviation and also the mean deviation about the mean.

Solution. Total frequency $N = \int_0^1 x^3 dx + \int_1^2 (2-x)^3 dx = \frac{1}{4} + \frac{1}{4} = \frac{1}{2}$

$$\therefore \mu'_1 \text{ (about the origin)} = \frac{1}{N} \left[\int_0^1 x \cdot x^3 dx + \int_1^2 x(2-x)^3 dx \right] \\ = 2 \left\{ \left| \frac{x^5}{5} \right|_0^1 + \left| -x \cdot \frac{(2-x)^4}{4} \right|_1^2 - \left| \frac{(2-x)^5}{20} \right|_1^2 \right\} = 2 \left(\frac{1}{5} + \frac{1}{4} + \frac{1}{20} \right) = 1$$

$$\mu'_2 \text{ (about the origin)} = \frac{1}{N} \left[\int_0^1 x^2 \cdot x^3 dx + \int_1^2 x^2 (2-x)^3 dx \right] \\ = 2 \left\{ \left| \frac{x^6}{6} \right|_0^1 + \left| -x^2 \cdot \frac{(2-x)^4}{4} \right|_1^2 + \frac{1}{2} \int_1^2 x(2-x)^4 dx \right\} \\ = 2 \left\{ \frac{1}{6} + \frac{1}{4} + \frac{1}{2} \left[\frac{1}{5} + \frac{1}{30} \right] \right\} = \frac{16}{15}$$

Hence $\sigma^2 = \mu_2 - (\mu'_1)^2 = \frac{1}{15}$

i.e., standard deviation $\sigma = \frac{1}{\sqrt{15}}$.

Mean deviation about the mean

$$\begin{aligned} &= \frac{1}{N} \left\{ \int_0^1 |x-1| x^3 dx + \int_1^2 |x-1| (2-x)^3 dx \right\} \\ &= 2 \left\{ \int_0^1 (1-x)x^3 dx + \int_1^2 (x-1)(2-x)^3 dx \right\} \\ &= 2 \left\{ \left(\frac{1}{4} - \frac{1}{5} \right) + \left(0 + \frac{1}{20} \right) \right\} = \frac{1}{5}. \end{aligned}$$

26.11 MOMENT GENERATING FUNCTION

(1) The moment generating function (m.g.f.) of the discrete probability distribution of the variate X about the value $x = a$ is defined as the expected value of $e^{t(x-a)}$ and is denoted by $M_a(t)$. Thus

$$M_a(t) = \sum p_i e^{t(x_i - a)} \quad \dots(1)$$

which is a function of the parameter t only.

Expanding the exponential in (1), we get

$$\begin{aligned} M_a(t) &= \sum p_i + t \sum p_i (x_i - a) + \frac{t^2}{2!} \sum p_i (x_i - a)^2 + \dots + \frac{t^r}{r!} \sum p_i (x_i - a)^r + \dots \\ &= 1 + t\mu'_1 + \frac{t^2}{2!} \mu'_2 + \dots + \frac{t^r}{r!} \mu'_r + \dots \quad \dots(2) \end{aligned}$$

where μ'_r is the moment of order r about a . Thus $M_a(t)$ generates moments and that is why it is called the moment generating function. From (2), we find

$$\mu'_r = \text{coefficient of } t^r/r! \text{ in the expansion of } M_a(t).$$

Otherwise differentiating (2) r times with respect to t and then putting $t = 0$, we get

$$\mu'_r = \left[\frac{d^r}{dt^r} M_a(t) \right]_{t=0} \quad \dots(3)$$

Thus the moment about any point $x = a$ can be found from (2) or more conveniently from the formula (3). Rewriting (1) as

$$M_a(t) = e^{-at} \sum p_i e^{tx_i} \quad \text{or} \quad M_a(t) = e^{-at} M_0(t) \quad \dots(4)$$

Thus the m.g.f. about the point $a = e^{-at}$ (m.g.f. about the origin).

Obs. The m.g.f. of the sum of two independent variables is the product of their m.g.f.s. (5)

(2) If $f(x)$ is the density function of a continuous variate X , then the moment generating function of this continuous probability distribution about $x = a$ is given by

$$M_a(t) = \int_{-\infty}^{\infty} e^{tx-a} f(x) dx.$$

Example 26.36. Find the moment generating function of the exponential distribution

$$f(x) = \frac{1}{c} e^{-x/c}, \quad 0 \leq x \leq \infty, \quad c > 0. \quad \text{Hence find its mean and S.D.}$$

(Kurukshetra, 2009)

Solution. The moment generating function about the origin is

$$\begin{aligned} M_0(t) &= \int_0^{\infty} e^{tx} \cdot \frac{1}{c} e^{-x/c} dx = \frac{1}{c} \int_0^{\infty} e^{(t-1/c)x} dx \\ &= \frac{1}{c} \left[\frac{e^{(t-1/c)x}}{(t-1/c)} \right]_0^{\infty} = (1-ct)^{-1} = 1 + ct + c^2 t^2 + c^3 t^3 + \dots \\ \therefore \mu'_1 &= \left[\frac{d}{dt} M_0(t) \right]_{t=0} = (c + 2c^2 t + 3c^3 t^2 + \dots)_{t=0} = c \\ \mu''_2 &= \left[\frac{d^2}{dt^2} M_0(t) \right]_{t=0} = 2c^2, \text{ and } \mu_2 = \mu''_2 - (\mu'_1)^2 = 2c^2 - c^2 = c^2. \end{aligned}$$

Hence the mean is c and S.D. is also c .

26.12 PROBABILITY GENERATING FUNCTION

The probability generating function (p.g.f.) $P_x(t)$ for a random variable x which takes integral values 0, 1, 2, 3, ... only, is defined by

$$P_x(t) = p_0 + p_1 t + p_2 t^2 + \dots = \sum_{n=0}^{\infty} p_n t^n = E(t^x)$$

The coefficient of t^n in the expansion of $P(t)$ in powers of t gives $P(t)_{x=n}$.

$$\frac{\partial P}{\partial t} = \sum_{n=0}^{\infty} n p_n t^{n-1} \quad \text{or} \quad \left(\frac{\partial P}{\partial t} \right)_{t=1} = \sum n p_n = \mu'_1$$

$$\begin{aligned} \frac{\partial^2 P}{\partial t^2} &= \sum_{n=0}^{\infty} n(n-1) p_n t^{n-2} \quad \text{or} \quad \left(\frac{\partial^2 P}{\partial t^2} \right)_{t=1} = \sum n(n-1) p_n = \mu''_2 - \mu'_1 \\ &= \mu_2 + \mu'_1 - \mu'_1 \text{ and so on} \end{aligned}$$

$$\text{Also} \quad \left(\frac{\partial^k P}{\partial t^k} \right)_{t=0} = n! p_n, \quad k = 1, 2, \dots, n.$$

For integral valued variates, we have

$$P_x(e^t) = E(e^{tx}) = \text{m.g.f. for } x.$$

Obs. The p.g.f. of the sum of two independent random variables is the product of their p.g.f.'s.

Example 26.37. If x be a random variable with probability generating function $P_x(t)$, find the probability generating function of

(i) $x+2$ (ii) $2x$.

Solution. We have $P_x(t) = \sum_{k=0}^{\infty} p_k t^k$

(i) Probability generating function of $x + 2 = \sum_{k=0}^{\infty} p_k t^{k+2} = t^2 \sum_{k=0}^{\infty} p_k t^k = t^2 P_x(t)$.

(ii) Probability generating function of $2x = \sum_{k=0}^{\infty} p_k t^{2k} = \sum_{k=0}^{\infty} p_k (t^2)^k = P(t^2)$.

PROBLEMS 26.4

1. A random variable x has the following probability function :

Values of x :	-2	-1	0	1	2	3
$p(x)$:	0.1	k	0.2	$2k$	0.3	k

Find the value of k and calculate mean and variance.

(S.V.T.U., 2007; V.T.U., 2004; Madras, 2003)

2. Find the standard deviation for the following discrete distribution :

x :	8	12	16	20	24
$p(x)$:	1/8	1/6	3/8	1/4	1/12

3. Obtain the distribution function of the total number of heads occurring in three tosses of an unbiased coin.

4. Show that for any discrete distribution $\beta_2 \geq 1$.

5. From an urn containing 3 red and 2 white balls, a man is to draw 2 balls at random without replacement, being promised Rs. 20 for each red ball he draws and Rs. 10 for each white one. Find his expectation.

6. Four coins are tossed. What is the expectation of the number of heads ?

7. The diameter of an electric cable is assumed to be a continuous variate with p.d.f. $f(x) = 6x(1-x)$, $0 < x < 1$. Verify that the above is a p.d.f. Also find the mean and variance.

8. A random variable gives measurements X between 0 and 1 with a probability function

$$\begin{aligned} f(x) &= 12x^2 - 21x^2 + 10x, \quad 0 \leq x \leq 1 \\ &= 0 \end{aligned}$$

(i) Find $P\left(X \leq \frac{1}{2}\right)$ and $P\left(X > \frac{1}{2}\right)$

(ii) Find a number k such that $P(X \leq k) = \frac{1}{2}$

(J.N.T.U., 2003)

9. The power reflected by an aircraft that is received by a radar can be described by an exponential random variable X .

The probability density of X is given by $f(x) = \begin{cases} \frac{1}{x_0} e^{-x/x_0}, & x \geq 0 \\ 0, & x < 0 \end{cases}$

where x_0 is the average power received by the radar.

- (i) What is the probability that the radar will receive power larger than the power received on the average ? (ii) What is the probability that the radar will receive power less than the power received on the average ?

(Mumbai, 2006)

10. A function is defined as follows :

$$\begin{aligned} f(x) &= 0, \quad x < 2 \\ &= \frac{1}{18} (2x+3), \quad 2 \leq x \leq 4 \\ &= 0, \quad x > 4. \end{aligned}$$

Show that it is a density function. Find the probability that a variate having this density will fall in the interval $2 \leq x \leq 3$?

11. A continuous distribution of a variable x in the range $(-3, 3)$ is defined as

$$\begin{aligned} f(x) &= \frac{1}{16} (3+x)^2, \quad -3 \leq x < -1 \\ &= \frac{1}{16} (2-6x^2), \quad -1 \leq x < 1 \\ &= \frac{1}{16} (3-x)^2, \quad 1 \leq x \leq 3. \end{aligned}$$

Verify that the area under the curve is unity. Show that the mean is zero.

(Kurukshetra, 2005)

12. The frequency function of a continuous random variable is given by

$$f(x) = y_0 x (2-x), \quad 0 \leq x \leq 2.$$

Find the value of y_0 , mean and variance of x .

(Kerala, 2005 ; J.N.T.U., 2003)

13. The probability density $p(x)$ of a continuous random variable is given by

$$p(x) = y_0 e^{-|x|}, \quad -\infty < x < \infty.$$

Prove that $y_0 = 1/2$. Find the mean and variance of the distribution.

(S.V.T.U., 2008 ; Kurukshetra, 2007 ; V.T.U., 2004)

14. If $f(x) = \begin{cases} \frac{1}{2}(x+1), & -1 < x < 1 \\ 0, & \text{elsewhere} \end{cases}$

represents the density of a random variable X , find $E(X)$ and $\text{Var}(X)$.

15. A function is defined as under :

$$\begin{aligned} f(x) &= 1/k, \quad x_1 \leq x \leq x_2 \\ &= 0, \quad \text{elsewhere}. \end{aligned}$$

Find the cumulative distribution of the variate x when k satisfies the requirements for $f(x)$ to be a density function.

26.13 REPEATED TRIALS

We know that the probability of getting a head or a tail on tossing a coin is $\frac{1}{2}$. If the coin is tossed thrice, the probability of getting one head and two tails can be combined as $H-T-T, T-H-T, T-T-H$. The probability of each one of these being $\frac{1}{2} \times \frac{1}{2} \times \frac{1}{2}$, i.e., $\left(\frac{1}{2}\right)^3$, their total probability shall be $3(1/2)^3$.

Similarly if a trial is repeated n times and if p is the probability of a success and q that of a failure, then the probability of r successes and $n-r$ failures is given by $p^r q^{n-r}$.

But these r successes and $n-r$ failures can occur in any of the ${}^n C_r$ ways in each of which the probability is same.

Thus the probability of r successes is ${}^n C_r p^r q^{n-r}$.

Cor. The probabilities of at least r successes in n trials

$$\begin{aligned} &= \text{the sum of the probabilities of } r, r+1, \dots, n \text{ successes} \\ &= {}^n C_r p^r q^{n-r} + {}^n C_{r+1} p^{r+1} q^{n-r-1} + \dots + {}^n C_n p^n. \end{aligned}$$

26.14 (1) BINOMIAL DISTRIBUTION*

It is concerned with trials of a repetitive nature in which only the occurrence or non-occurrence, success or failure, acceptance or rejection, yes or no of a particular event is of interest.

If we perform a series of independent trials such that for each trial p is the probability of a success and q that of a failure, then the probability of r successes in a series of n trials is given by ${}^n C_r p^r q^{n-r}$, where r takes any integral value from 0 to n . The probabilities of 0, 1, 2, ..., r , ..., n successes are, therefore, given by

$$q^n, {}^n C_1 p q^{n-1}, {}^n C_2 p^2 q^{n-2}, \dots, {}^n C_r p^r q^{n-r}, \dots, p^n.$$

The probability of the number of successes so obtained is called the **binomial distribution** for the simple reason that the probabilities are the successive terms in the expansion of the binomial $(q+p)^n$.

i. the sum of the probabilities

$$= q^n + {}^n C_1 p q^{n-1} + {}^n C_2 p^2 q^{n-2} + \dots + p^n = (q+p)^n = 1.$$

(2) Constants of the binomial distribution. The moment generating function about the origin is

$$\begin{aligned} M_0(t) &= E(e^{tx}) = \sum {}^n C_x p^x q^{n-x} e^{tx} \\ &= \sum {}^n C_x (pe^t)^x q^{n-x} = (q+pe^t)^n \end{aligned}$$

[By (1) § 26.11]

* It was discovered by a Swiss mathematician Jacob Bernoulli and was published posthumously in 1713.

Differentiating with respect to t and putting $t = 0$ and using (3) § 26.11, we get the mean

$$\mu'_1 = np.$$

Since $M_a(t) = e^{-at} M_0(t)$, the m.g.f. of the binomial distribution about its mean ($m = np$), is given by

$$M_m(t) = e^{-np} (q + pe^t)^n = (qe^{-pt} + pe^{qt})^n$$

$$= \left(1 + pq \frac{t^2}{2!} + pq(q^2 - p^2) \frac{t^3}{3!} + pq(q^3 + p^3) \frac{t^4}{4!} + \dots \right)^n$$

or $1 + \mu_1 t + \mu_2 \frac{t^2}{2!} + \mu_3 \frac{t^3}{3!} + \mu_4 \frac{t^4}{4!} + \dots$

$$= 1 + npq \frac{t^2}{2!} + npq(q-p) \frac{t^3}{3!} + npq[1 + 3(n-2)pq] \frac{t^4}{4!} + \dots$$

Equating the coefficients of like powers of t on either side, we have

$$\mu_2 = npq, \mu_3 = npq(q-p), \mu_4 = npq[1 + 3(n-2)pq].$$

Also $\beta_1 = \frac{\mu_3^2}{\mu_2^3} = \frac{(q-p)^2}{npq} = \frac{(1-2p)^2}{npq}$ and $\beta_2 = \frac{\mu_4}{\mu_2^2} = 3 + \frac{1-6pq}{npq}$

Thus mean = np , standard deviation = $\sqrt{(npq)}$.

skewness = $(1-2p)/\sqrt{(npq)}$, kurtosis = β_2 .

Obs. The skewness is positive for $p < \frac{1}{2}$ and negative for $p > \frac{1}{2}$. When $p = \frac{1}{2}$, the skewness is zero, i.e., the probability curve of the binomial distribution will be symmetrical (bell-shaped).

As n the number of trials increase indefinitely, $\beta_1 \rightarrow 0$, and $\beta_2 \rightarrow 3$.

(3) Binomial frequency distribution. If n independent trials constitute one experiment and this experiment be repeated N times, then the frequency of r successes is $N^n C_r p^r q^{n-r}$. The possible number of successes together with these expected frequencies constitute the *binomial frequency distribution*.

(4) Applications of Binomial distribution. This distribution is applied to problems concerning :

(i) Number of defectives in a sample from production line,

(ii) Estimation of reliability of systems,

(iii) Number of rounds fired from a gun hitting a target,

(iv) Radar detection.

Example 26.38. The probability that a pen manufactured by a company will be defective is $1/10$. If 12 such pens are manufactured, find the probability that

(a) exactly two will be defective. (b) at least two will be defective.

(c) none will be defective.

(V.T.U., 2004 ; Burdwan, 2003)

Solution. The probability of a defective pen is $1/10 = 0.1$

∴ The probability of a non-defective pen is $1 - 0.1 = 0.9$

(a) The probability that exactly two will be defective

$$= {}^{12}C_2 (0.1)^2 (0.9)^{10} = 0.2301$$

(b) The probability that at least two will be defective

$$= 1 - (\text{prob. that either none or one is non-defective})$$

$$= 1 - [{}^{12}C_0 (0.9)^{12} + {}^{12}C_1 (0.1)(0.9)^{11}] = 0.3412$$

(c) The probability that none will be defective

$$= {}^{12}C_{12} (0.9)^{12} = 0.2833.$$

Example 26.39. In 256 sets of 12 tosses of a coin, in how many cases one can expect 8 heads and 4 tails.

(J.N.T.U., 2003)

Solution. $P(\text{head}) = \frac{1}{2}$ and $P(\text{tail}) = \frac{1}{2}$

By binomial distribution, probability of 8 heads and 4 tails in 12 trials is

$$P(X = 8) = {}^{12}C_8 \left(\frac{1}{2}\right)^8 \left(\frac{1}{2}\right)^4 = \frac{12!}{8!4!} \cdot \frac{1}{2^{12}} = \frac{495}{4096}$$

\therefore the expected number of such cases in 256 sets

$$= 256 \times P(X = 8) = 256 \cdot \frac{495}{4096} = 30.9 = 31 \text{ (say).}$$

Example 26.40. In sampling a large number of parts manufactured by a machine, the mean number of defectives in a sample of 20 is 2. Out of 1000 such samples, how many would be expected to contain at least 3 defective parts.
(V.T.U., 2004)

Solution. Mean number of defectives = $2 = np = 20p$.

\therefore The probability of a defective part is $p = 2/20 = 0.1$.

and the probability of a non-defective part = 0.9

\therefore The probability of at least three defectives in a sample of 20.

$$\begin{aligned} &= 1 - (\text{prob. that either none, or one, or two are non-defective parts}) \\ &= 1 - [{}^{20}C_0(0.9)^{20} + {}^{20}C_1(0.1)(0.9)^{19} + {}^{20}C_2(0.1)^2(0.9)^{18}] \\ &= 1 - (0.9)^{18} \times 4.51 = 0.323. \end{aligned}$$

Thus the number of samples having at least three defective parts out of 1000 samples
= $1000 \times 0.323 = 323$.

Example 26.41. The following data are the number of seeds germinating out of 10 on damp filter paper for 80 sets of seeds. Fit a binomial distribution to these data :

x :	0	1	2	3	4	5	6	7	8	9	10
f :	6	20	28	12	8	6	0	0	0	0	0

Solution. Here $n = 10$ and $N = \sum f_i = 80$

$$\therefore \text{mean} = \frac{\sum f_i x_i}{\sum f_i} = \frac{20 + 56 + 36 + 32 + 30}{80} = \frac{174}{80} = 2.175$$

Now the mean of a binomial distribution = np

$$\text{i.e., } np = 10p = 2.175 \quad \therefore p = 0.2175, q = 1 - p = 0.7825$$

Hence the binomial distribution to be fitted is

$$\begin{aligned} N(q+p)^n &= 80(0.7825 + 0.2175)^{10} \\ &= 80 \cdot {}^{10}C_0 (0.7825)^{10} + 80 \cdot {}^{10}C_1 (0.7825)^9 (0.2175)^1 + {}^{10}C_2 (0.7825)^8 (0.2175)^2 + \\ &\quad \dots + {}^{10}C_9 (0.7825)^1 (0.2175)^9 + {}^{10}C_{10} (0.2175)^{10} \\ &= 6.885 + 19.13 + 23.94 + \dots + 0.00007 + 0.00002 \end{aligned}$$

\therefore the successive terms in the expansion give the expected or theoretical frequencies which are

x :	0	1	2	3	4	5	6	7	8	9	10
f :	6.9	19.1	24.0	17.8	8.6	2.9	0.7	0.1	0	0	0

PROBLEMS 26.5

- Determine the binomial distribution for which mean = 2 (variance) and mean + variance = 3. Also find $P(X \leq 3)$.
(Kerala, 2005)
- An ordinary six-faced die is thrown four times. What are the probabilities of obtaining 4, 3, 2, 1 and 0 faces?
- If the chance that one of the ten telephone lines is busy at an instant is 0.2.
 - What is the chance that 5 of the lines are busy?
 - What is the most probable number of busy lines and what is the probability of this number?
 - What is the probability that all the lines are busy?
- If the probability that a new-born child is a male is 0.6, find the probability that in a family of 5 children there are exactly 3 boys.
(V.T.U., 2002 S)
(Kurukshetra, 2005)

5. If on an average 1 vessel in every 10 is wrecked, find the probability that out of 5 vessels expected to arrive, at least 4 will arrive safely. (P.T.U., 2005)
6. The probability that a bomb dropped from a plane will strike the target is $1/5$. If six bombs are dropped, find the probability that (i) exactly two will strike the target, (ii) at least two will strike the target.
7. A sortie of 20 aeroplanes is sent on an operational flight. The chances that an aeroplane fails to return is 5%. Find the probability that (i) one plane does not return (ii) at the most 5 planes do not return, and (iii) what is the most probable number of returns? (Hissar, 2007)
8. The probability that an entering student will graduate is 0.4. Determine the probability that out of 5 students (a) none (b) one and (c) at least one will graduate.
9. Out of 800 families with 5 children each, how many would you expect to have (a) 3 boys, (b) 5 girls, (c) either 2 or 3 boys? Assume equal probabilities for boys and girls. (V.T.U., 2004)
10. If 10 per cent of the rivets produced by a machine are defective, find the probability that out of 5 rivets chosen at random (i) none will be defective, (ii) one will be defective, and (iii) at least two will be defective.
11. In a bombing action there is 50% chance that any bomb will strike the target. Two direct hits are needed to destroy the target completely. How many bombs are required to be dropped to give a 99% chance or better of completely destroying the target. (V.T.U., 2003 S)
12. A product is 0.5% defective and is packed in cartons of 100. What percentage contains not more than 3 defectives?
13. If in a lot of 500 solenoids 25 are defective, find the probability of 0, 1, 2, 3 defective solenoids in a random sample of 20 solenoids.
14. 500 articles were selected at random out of a batch containing 10,000 articles, and 30 were found to be defective. How many defectives articles would you reasonably expect to have in the whole batch? (J.N.T.U., 2003)
15. Fit a binomial distribution for the following data and compare the theoretical frequencies with the actual ones :
 x : 0 1 2 3 4 5
 f : 2 14 20 34 22 8 (Bhopal, 2006)
16. Fit a binomial distribution to the following frequency distribution :
 x : 0 1 2 3 4 5 6
 f : 13 25 52 58 32 16 4 (Kurukshetra, 2009 ; S.V.T.U., 2007)

26.15 (1) POISSON DISTRIBUTION*

It is a distribution related to the probabilities of events which are extremely rare, but which have a large number of independent opportunities for occurrence. The number of persons born blind per year in a large city and the number of deaths by horse kick in an army corps are some of the phenomena, in which this law is followed.

This distribution can be derived as a limiting case of the binomial distribution by making n very large and p very small, keeping np fixed (= m, say).

The probability of r successes in a binomial-distribution is

$$\begin{aligned} P(r) &= {}^n C_r p^r q^{n-r} = \frac{n(n-1)(n-2)\cdots(n-r+1)}{r!} p^r q^{n-r} \\ &= \frac{np(np-p)(np-2p)\cdots(np-r-1p)}{r!} (1-p)^{n-r} \end{aligned}$$

As $n \rightarrow \infty$, $p \rightarrow 0$ ($np = m$), we have

$$P(r) = \frac{m^r}{r!} \underset{n \rightarrow \infty}{\text{Lt}} \frac{(1-m/n)^n}{(1-m/n)^r} = \frac{m^r}{r!} e^{-m}$$

so that the probabilities of 0, 1, 2..., r... successes in a Poisson distribution are given by

$$e^{-m}, me^{-m}, \frac{m^2 e^{-m}}{2!}, \dots, \frac{m^r e^{-m}}{r!}, \dots$$

The sum of these probabilities is unity as it should be.

* It was discovered by a French mathematician S.D. Poisson in 1837.

(2) Constants of the Poisson distribution. These constants can easily be derived from the corresponding constants of the binomial distribution simply by making $n \rightarrow \infty$, $p \rightarrow 0$, ($q \rightarrow 1$) and noting that $np = m$

$$\text{Mean} = \text{Lt}(np) = m$$

$$\mu_2 = \text{Lt}(npq) = m \text{ Lt}(q) = m$$

$$\therefore \text{Standard deviation} = \sqrt{m}$$

$$\text{Also } \mu_3 = m, \mu_4 = m + 3m^2$$

$$\therefore \text{Skewness} (= \sqrt{\beta_1}) = 1/m, \text{Kurtosis} (= \beta_2) = 3 + 1/m.$$

Since μ_3 is positive, Poisson distribution is positively skewed and since $\beta_2 > 3$, it is *Leptokurtic*.

(3) Applications of Poisson distribution. This distribution is applied to problems concerning :

(i) Arrival pattern of 'defective vehicles in a workshop', 'patients in a hospital' or 'telephone calls'.

(ii) Demand pattern for certain spare parts.

(iii) Number of fragments from a shell hitting a target.

(iv) Spatial distribution of bomb hits.

Example 26.42. If the probability of a bad reaction from a certain injection is 0.001, determine the chance that out of 2,000 individuals more than two will get a bad reaction. (V.T.U., 2008 ; Kottayam, 2005)

Solution. It follows a Poisson distribution as the probability of occurrence is very small.

$$\text{Mean } m = np = 2000(0.001) = 2$$

Probability that more than 2 will get a bad reaction

$$= 1 - [\text{prob. that no one gets a bad reaction} + \text{prob. that one gets a bad reaction} + \text{prob. that two get bad reaction}]$$

$$= 1 - \left[e^{-m} + \frac{m^1 e^{-m}}{1!} + \frac{m^2 e^{-m}}{2!} \right] = 1 - \left[\frac{1}{e^2} + \frac{2}{e^2} + \frac{2}{e^2} \right] \quad [\because m = 2]$$

$$= 1 - \frac{5}{e^2} = 0.32. \quad [\because e = 2.718]$$

Example 26.43. In a certain factory turning out razor blades, there is a small chance of 0.002 for any blade to be defective. The blades are supplied in packets of 10, use Poisson distribution to calculate the approximate number of packets containing no defective, one defective and two defective blades respectively in a consignment of 10,000 packets. (Kurukshetra, 2009 S; Madras, 2006 ; V.T.U., 2004)

Solution. We know that $m = np = 10 \times 0.002 = 0.02$

$$e^{-0.02} = 1 - 0.02 + \frac{(0.02)^2}{2!} - \dots = 0.9802 \text{ approximately}$$

$$\text{Probability of no defective blade is } e^{-m} = e^{-0.02} = 0.9802$$

\therefore no. of packets containing no defective blade is

$$10,000 \times 0.9802 = 9802$$

Similarly the number of packets containing one defective blade = $10,000 \times me^{-m}$

$$= 10,000 \times (0.02) \times 0.9802 = 196$$

Finally the number of packets containing two defective blades

$$= 10,000 \times \frac{m^2 e^{-m}}{2!} = 10,000 \times \frac{(0.02)^2}{2!} \times 0.9802 = 2 \text{ approximately.}$$

Example 26.44. Fit a Poisson distribution to the set of observations :

x:	0	1	2	3	4
f:	122	60	15	2	1

(Bhopal, 2007 S ; V.T.U., 2004 ; U.P.T.U., 2003)

Solution. Mean = $\frac{\sum f_i x_i}{\sum f_i} = \frac{60 + 36 + 6 + 4}{200} = 0.5$.

∴ mean of Poisson distribution i.e., $m = 0.5$.

Hence the theoretical frequency for r successes is

$$\frac{Ne^{-m}(m)^r}{r!} = \frac{200e^{-0.5}(0.5)^r}{r!} \text{ where } r = 0, 1, 2, 3, 4$$

∴ the theoretical frequencies are

$x :$	0	1	2	3	4
$f :$	121	61	15	2	0

$$(\because e^{-0.5} = 0.61)$$

PROBLEMS 26.6

- If a random variable has a Poisson distribution such that $P(1) = P(2)$, find
(i) mean of the distribution. (ii) $P(4)$. (V.T.U., 2003)
 - X is a Poisson variable and it is found that the probability that $X = 2$ is two-thirds of the probability that $X = 1$. Find the probability that $X = 0$ and the probability that $X = 3$. What is the probability that X exceeds 3 ?
 - For Poisson distribution, prove that $m \mu_1 \gamma_1 = 1$, where symbols have their usual meanings. (S.V.T.U., 2008)
 - A certain screw making machine produces on average of 2 defective screws out of 100, and packs them in boxes of 500. Find the probability that a box contains 15 defective screws. (Kurukshetra, 2006)
 - A manufacturer knows that the condensers he makes contain on the average 1% defectives. He packs them in boxes of 100. What is the probability that a box picked at random will contain 3 or more faulty condensers ?
 - A car-hire firm has two cars which it hires out day by day. The number of demands for a car on each day is distributed as a Poisson distribution with mean 1.5. Calculate the proportion of days (i) on which there is no demand, (ii) on which demand is refused. ($e^{-1.5} = 0.2231$). (Bhopal, 2008 S ; J.N.T.U., 2003)
 - The incidence of occupational disease in an industry is such that the workmen have a 10% chance of suffering from it. What is probability that in a group of 7, five or more will suffer from it ?
 - The frequency of accidents per shift in a factory is as shown in the following table :
- | | | | | | |
|-----------------------|-----|----|----|---|---|
| Accidents per shift : | 0 | 1 | 2 | 3 | 4 |
| Frequency : | 180 | 92 | 24 | 3 | 1 |
- Calculate the mean number of accidents per shift and the corresponding Poisson distribution and compare with actual observations.
- A source of liquid is known to contain bacteria with the mean number of bacteria per cubic centimetre equal to 3. Ten 1 c.c. test-tubes are filled with the liquid. Assuming that Poisson distribution is applicable, calculate the probability that all the test-tubes will show growth i.e., contain atleast 1 bacterium each.
 - Find the expectation of the function $\phi(x) = xe^{-x}$ in a Poisson distribution. (V.T.U., 2003)

[Hint : If m be the mean of the Poisson distribution, then expectation of

$$\phi(x) = \sum_{x=0}^{\infty} \frac{\phi(x) \cdot m^x e^{-m}}{x!} = m \exp. m (e^{-1} - m - 1)$$

- Fit a Poisson distribution to the following :

$x :$	0	1	2	3	4
$f :$	46	38	22	9	1

(Kurukshetra, 2009 ; Bhopal, 2008 ; V.T.U., 2003 S)

- Fit a Poisson distribution to the following data given the number of yeast cells per square for 400 squares :

No. of cells per sq. :	0	1	2	3	4	5	6	7	8	9	10
No. of squares :	103	143	98	42	8	4	2	0	0	0	0

(S.V.T.U., 2007)

26.16 (1) NORMAL DISTRIBUTION*

Now we consider a continuous distribution of fundamental importance, namely the normal distribution. Any quantity whose variation depends on random causes is distributed according to the normal law. Its importance lies in the fact that a large number of distributions approximate to the normal distribution.

* In 1924, Karl Pearson found this distribution which Abraham De Moivre had discovered as early as 1733. See footnote p. 843 and 647.

Let us define a variate $z = \frac{x - np}{\sqrt{(npq)}}$... (1)

where x is a binomial variate with mean np and S.D. $\sqrt{(npq)}$ so that z is a variate with mean zero and variance unity. In the limit as n tends to infinity, the distribution of z becomes a continuous distribution extending from $-\infty$ to ∞ .

It can be shown that the limiting form of the binomial distribution (1) for large values of n when neither p nor q is very small, is the normal distribution. The normal curve is of the form

$$y = \frac{1}{\sigma\sqrt{(2\pi)}} e^{-(x - \mu)^2/2\sigma^2} \quad \dots (2)$$

where μ and σ are the mean and standard deviation respectively.

(2) Properties of the normal distribution

I. The normal curve (2) is bell-shaped and is symmetrical about its mean. It is unimodal with ordinates decreasing rapidly on both sides of the mean (Fig. 26.3). The maximum ordinate is $1/\sigma\sqrt{(2\pi)}$, found by putting $x = \mu$ in (2).

As it is symmetrical, its mean, median and mode are the same. Its points of inflexion (found by putting $d^2y/dx^2 = 0$ and verifying that at these points $d^3y/dx^3 \neq 0$) are given by $x = \mu \pm \sigma$, i.e., these points are equidistant from the mean on either side.

II. Mean deviation from the mean μ

$$\begin{aligned} &= \int_{-\infty}^{\infty} |x - \mu| \cdot \frac{1}{\sigma\sqrt{(2\pi)}} e^{-(x - \mu)^2/2\sigma^2} dx \\ &= \frac{\sigma}{\sqrt{(2\pi)}} \int_{-\infty}^{\infty} |z| e^{-z^2/2} dz \\ &= \frac{\sigma}{\sqrt{(2\pi)}} \left[\int_{-\infty}^0 -ze^{-z^2/2} dz + \int_0^{\infty} ze^{-z^2/2} dz \right] = \frac{2\sigma}{\sqrt{(2\pi)}} \int_0^{\infty} ze^{-z^2/2} dz \\ &= \frac{2\sigma}{\sqrt{(2\pi)}} \left| -e^{-z^2/2} \right|_0^{\infty} = -\sqrt{\left(\frac{2}{\pi}\right)} \sigma(0 - 1) = 0.7979 \sigma = (4/5)\sigma \end{aligned} \quad [\text{Put } z = (x - \mu)/\sigma]$$

III. Moments about the mean

$$\begin{aligned} \mu_{2n+1} &= \int_{-\infty}^{\infty} (x - \mu)^{2n+1} \frac{1}{\sigma\sqrt{(2\pi)}} e^{-(x - \mu)^2/2\sigma^2} dx \\ &= \frac{\sigma^{2n+1}}{\sqrt{(2\pi)}} \int_{-\infty}^{\infty} z^{2n+1} e^{-z^2/2} dz \text{ where } z = (x - \mu)/\sigma \\ &= 0, \text{ since the integral is an odd function.} \end{aligned}$$

Thus all odd order moments about the mean vanish.

$$\begin{aligned} \mu_{2n} &= \int_{-\infty}^{\infty} (x - \mu)^{2n} \frac{1}{\sigma\sqrt{(2\pi)}} e^{-(x - \mu)^2/2\sigma^2} dx \\ &= \frac{\sigma^{2n}}{\sqrt{(2\pi)}} \int_{-\infty}^{\infty} z^{2n} e^{-z^2/2} \cdot zdz \\ &= \frac{\sigma^{2n}}{\sqrt{(2\pi)}} \left[\left| -z^{2n-1} e^{-z^2/2} \right|_{-\infty}^{\infty} + \int_{-\infty}^{\infty} (2n-1)z^{2n-2} e^{-z^2/2} dz \right] \\ &= \frac{\sigma^{2n}}{\sqrt{(2\pi)}} (0 - 0) + (2n-1) \sigma^2 \mu_{2n-2} \end{aligned} \quad [\text{Integrate by parts}]$$

Repeated application of this reduction formula, gives

$$\mu_{2n} = (2n-1)(2n-3) \dots 3 \cdot 1 \sigma^{2n}$$

In particular, $\mu_2 = \sigma^2$, $\mu_4 = 3\sigma^4$.

$$\text{Hence } \beta_1 = \frac{\mu_3^2}{\mu_2^3} = 0 \text{ and } \beta_2 = \frac{\mu_4}{\mu_2^2} = 3$$

i.e., the coefficient of skewness is zero (i.e. the curve is symmetrical) and the Kurtosis is 3. This is the basis for the choice of the value 3 in the definitions of platykurtic and leptokurtic (page 844).

IV. The probability of x lying between x_1 and x_2 is given by the area under the normal curve from x_1 to x_2 , i.e., $P(x_1 \leq x \leq x_2)$

$$\begin{aligned} &= \frac{1}{\sigma\sqrt{2\pi}} \int_{x_1}^{x_2} e^{-(x-\mu)^2/2\sigma^2} dx \\ &= \frac{1}{\sqrt{2\pi}} \int_{z_1}^{z_2} e^{-z^2/2} dz \text{ where } z = (x - \mu)/\sigma, dz = dx/\sigma \text{ and } z_1 = (x_1 - \mu)/\sigma, z_2 = (x_2 - \mu)/\sigma. \\ &= \frac{1}{\sqrt{2\pi}} \left\{ \int_0^{z_2} e^{-z^2/2} dz - \int_0^{z_1} e^{-z^2/2} dz \right\} = P_2(z) - P_1(z) \end{aligned}$$

The values of each of the above integrals can be found from the table III—Appendix 2, which gives the values of

$$P(z) = \frac{1}{\sqrt{2\pi}} \int_0^z e^{-z^2/2} dz$$

for various values of z . This integral is called the *probability integral* or the *error function* due to its use in the theory of sampling and the theory of errors.

Using this table, we see that the area under the normal curve from $z = 0$ to $z = 1$, i.e. from $x = \mu$ to $\mu + \sigma$ is 0.3413.

∴ (i) The area under the normal curve between the ordinates $x = \mu - \sigma$ and $x = \mu + \sigma$ is 0.6826, ~ 68% nearly. Thus approximately 2/3 of the values lie within these limits.

(ii) The area under the normal curve between $x = \mu - 2\sigma$ and $x = \mu + 2\sigma$ is 0.9544 ~ 95.5%, which implies that about $\frac{1}{2}\%$ of the values lie outside these limits.

(iii) 99.73% of the values lie between $x = \mu - 3\sigma$ and $x = \mu + 3\sigma$ i.e., only a quarter % of the whole lies outside these limits.

(iv) 95% of the values lie between $x = \mu - 1.96\sigma$ and $x = \mu + 1.96\sigma$ i.e., only 5% of the values lie outside these limits.

(v) 99% of the values lie between $x = \mu - 2.58\sigma$ and $x = \mu + 2.58\sigma$ i.e., only 1% of the values lie outside these limits.

(vi) 99.9% of the values lie between $x = \mu - 3.29\sigma$ and $x = \mu + 3.29\sigma$.

In other words, a value that deviates more than σ from μ occurs about once in 3 trials. A value that deviates more than 2σ or 3σ from μ occurs about once in 20 or 400 trials. Almost all values lie within 3σ of the mean.

The shape of the standardised normal curve is

$$y = \frac{1}{\sqrt{2\pi}} e^{-z^2/2} \text{ where } z = (x - \mu)/\sigma \quad \dots(3)$$

and the respective areas are shown in Fig. 26.4. 'z' is called a *normal variate*.

(3) Normal frequency distribution. We can fit a normal curve to any distribution. If N be the total frequency, μ the mean and σ the standard deviation of the given distribution then the curve

$$y = \frac{N}{\sigma\sqrt{2\pi}} e^{-(x-\mu)^2/2\sigma^2} \quad \dots(4)$$

will fit the given distribution as best as the data will permit. The frequency of the variate between x_1 and x_2 as given by the fitted curve, will be the area under (1) from x_1 to x_2 .

(4) Applications of normal distribution. This distribution is applied to problems concerning :

(i) Calculation of errors made by chance in experimental measurements.

(ii) Computation of hit probability of a shot.

(iii) Statistical inference in almost every branch of science.

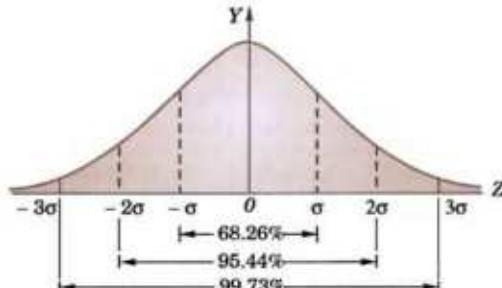

Fig. 26.4

26.17 PROBABLE ERROR

Any lot of articles manufactured to certain specifications is subject to small errors. In fact, measurement of any physical quantity shows slight error. In general, these errors of manufacture or experiment are of random nature and therefore, follow a normal distribution. While quoting a specification of an experimental result, we usually mention the *probable error* (λ). It is such that the probability of an error falling within the limits $\mu - \lambda$ and $\mu + \lambda$ is exactly equal to the chance of an error falling outside these limits, i.e. the chance of an error lying

within $\mu - \lambda$ and $\mu + \lambda$ is $\frac{1}{2}$.

$$\therefore \frac{1}{\sigma\sqrt{2\pi}} \int_{\mu-\lambda}^{\mu+\lambda} e^{-(x-\mu)^2/2\sigma^2} dx = \frac{1}{2}$$

or $\frac{1}{\sqrt{2\pi}} \int_0^{\lambda/\sigma} e^{-z^2/2} dz = \frac{1}{4}$

$$\left[z = \frac{x - \mu}{\sigma} \right]$$

The table V, (Appendix 2) gives $\lambda/\sigma = 0.6745$

Hence the probable error $\lambda = 0.6745\sigma = \frac{2}{3}\sigma$.

$$\text{Obs. Quartile deviation} = \frac{1}{2}(Q_3 - Q_1) = \frac{2}{3}\sigma; \text{Mean deviation} = \frac{4}{5}\sigma$$

$$\therefore Q.D. : M.D. : S.D. = 10 : 12 : 15.$$

[p. 839]

(Madras, 2003)

Example 26.45. X is a normal variate with mean 30 and S.D. 5, find the probabilities that (i) $26 \leq X \leq 40$, (ii) $X \geq 45$ and (iii) $|X - 30| > 5$. (J.N.T.U., 2005)

Solution. We have $\mu = 30$ and $\sigma = 5$

$$\therefore z = \frac{X - \mu}{\sigma} = \frac{X - 30}{5}$$

(i) When $X = 26, z = -0.8$; when $X = 40, z = 2$

$$\begin{aligned} P(26 \leq X \leq 40) &= P(-0.8 \leq z \leq 2) \\ &= P(-0.8 \leq z \leq 0) + P(0 \leq z \leq 2) \\ &= P(0 \leq z \leq 0.8) + 0.4772 \\ &= 0.2881 + 0.4772 = 0.7653 \end{aligned}$$

[Using Table III]

(ii) When $X = 45, z = 3$

$$\begin{aligned} P(X \geq 45) &= P(z \geq 3) = 0.5 - P(0 \leq z \leq 3) \\ &= 0.5 - 0.4986 = 0.0014 \end{aligned}$$

$$\begin{aligned} (iii) P(|X - 30| \leq 5) &= P(25 \leq X \leq 35) \\ &= P(-1 \leq z \leq 1) = 2P(0 \leq z \leq 1) \\ &= 2 \times 0.3413 = 0.6826 \end{aligned}$$

$$\therefore P(|X - 30| > 5) = 1 - P(|X - 30| \leq 5) = 1 - 0.6826 = 0.3174.$$

Example 26.46. A certain number of articles manufactured in one batch were classified into three categories according to a particular characteristic, being less than 50, between 50 and 60 and greater than 60. If this characteristic is known to be normally distributed, determine the mean and standard deviation for this batch if 60%, 35% and 5% were found in these categories.

Solution. Let μ be the mean (at $z = 0$) and σ the standard deviation of the normal curve (Fig. 26.5).

Now 60% of the articles have the characteristic below 50, 35% between 50 and 60 and only 5% greater than 60.

Let the area to the left of the ordinate PQ be 60% and that between the ordinates PQ and ST be 35% so that the areas to the left of PQ ($z = z_1$) and ST ($z = z_2$) are 0.6 and 0.95 respectively, i.e., the area $OPQR = 0.6 - 0.5 = 0.1$ and the area $OSTR = 0.45$.

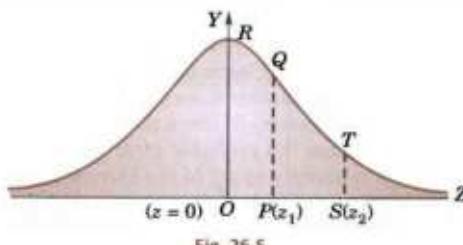

\therefore area corresponding to $z_1 \left(= \frac{50 - \mu}{\sigma} \right) = 0.1$

and that corresponding to $z_2 \left(= \frac{60 - \mu}{\sigma} \right) = 0.45$

From the table III, we have

$$(50 - \mu)/\sigma = 0.2533 \quad \text{and} \quad (60 - \mu)/\sigma = 1.645$$

$$\text{whence} \quad \sigma = 7.543 \quad \text{and} \quad \mu = 48.092.$$

Example 26.47. In a normal distribution, 31% of the items are under 45 and 8% are over 64. Find the mean and S.D. of the distribution. (V.T.U., 2009; S.V.T.U., 2008; Kurukshetra, 2007 S)

Solution. Let \bar{x} be the mean and σ the S.D. 31% of the items are under 45 means area to the left of the ordinate $x = 45$. (Fig. 26.6)

$$\text{When } x = 45, \text{ let } z = z_1 \text{ so that } z_1 = \frac{45 - \bar{x}}{\sigma} \quad \dots(i)$$

$$\therefore \int_{-\infty}^{z_1} \phi(z) dz = 0.31 \quad \text{or} \quad \int_{-\infty}^0 \phi(z) dz - \int_{z_1}^0 \phi(z) dz = 0.31$$

$$\text{Hence} \quad \int_{z_1}^0 \phi(z) dz = \int_{-\infty}^0 \phi(z) dz - 0.31 = 0.5 - 0.31 = 0.19$$

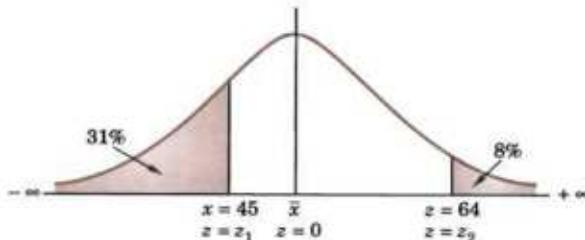

Fig. 26.6

From table III, $z_1 = -0.5$

When $x = 64$, let $z = z_2$ so that $z_2 = (64 - \bar{x})/\sigma$

$$\therefore \int_{z_2}^{\infty} \phi(z) dz = 0.08 \quad \text{or} \quad \int_0^{\infty} \phi(z) dz - \int_0^{z_2} \phi(z) dz = 0.08 \quad \dots(ii)$$

$$\text{Hence} \quad \int_0^{z_2} \phi(z) dz = \int_0^{\infty} \phi(z) dz - 0.08 = 0.5 - 0.08 = 0.42 \quad \dots(iii)$$

From table III, $z_2 = 1.4$

From (i) and (ii), $45 - \bar{x} = -0.5\sigma$

From (iii) and (iv), $64 - \bar{x} = 1.4\sigma$

Solving these equations, we get $\bar{x} = 50$ and $\sigma = 10$.

Example 26.48. In a test on 2000 electric bulbs, it was found that the life of a particular make, was normally distributed with an average life of 2040 hours and S.D. of 60 hours. Estimate the number of bulbs likely to burn for

(a) more than 2150 hours, (b) less than 1950 hours and

(c) more than 1920 hours and but less than 2160 hours.

(Bhopal, 2008 S; U.P.T.U., 2008)

Solution. Here $\mu = 2040$ hours and $\sigma = 60$ hours.

(a) For $x = 2150$, $z = \frac{x - \mu}{\sigma} = 1.833$.

\therefore area against $z = 1.83$ in the table III = 0.4664.

We, however, require the area to the right of the ordinate at $z = 1.83$. This area = $0.5 - 0.4664 = 0.0336$.

Thus the number of bulbs expected to burn for more than 2150 hours

$$= 0.0336 \times 2000 = 67 \text{ approximately.}$$

$$(b) \text{ For } x = 1950, z = \frac{x - \mu}{\sigma} = -1.5$$

The area required in this case is to the left of $z = -1.33$

$$\text{i.e.,} \quad \begin{aligned} &= 0.5 - 0.4082 \text{ (table value for } z = 1.33) \\ &= 0.0918. \end{aligned}$$

\therefore the number of bulbs expected to burn for less than 1950 hours

$$= 0.0918 \times 2000 = 184 \text{ approximately.}$$

$$(c) \text{ When } x = 1920, \quad z = \frac{1920 - 2040}{60} = -2$$

$$\text{When } x = 2160, \quad z = \frac{2160 - 2040}{60} = 2.$$

The number of bulbs expected to burn for more than 1920 hours but less than 2160 hours will be represented by the area between $z = -2$ and $z = 2$. This is twice the area from the table for $z = 2$, i.e., $= 2 \times 0.4772 = 0.9544$.

Thus the required number of bulbs = $0.9544 \times 2000 = 1909$ nearly.

Example 26.49. If the probability of committing an error of magnitude x is given by

$$y = \frac{h}{\sqrt{\pi}} e^{-h^2 x^2};$$

compute the probable error from the following data :

$$\begin{aligned} m_1 &= 1.305; & m_2 &= 1.301; & m_3 &= 1.295; & m_4 &= 1.286; \\ m_5 &= 1.318; & m_6 &= 1.321; & m_7 &= 1.283; & m_8 &= 1.289; \\ m_9 &= 1.300; & m_{10} &= 1.286. \end{aligned}$$

(Kurukshetra, 2005)

Solution. From the given data which is normally distributed, we have

$$\text{mean} = \frac{1}{10} \sum m_i = \frac{12.984}{10} = 1.2984$$

and

$$\begin{aligned} \sigma^2 &= \frac{1}{10} \sum (m_i - \text{mean})^2 \\ &= \frac{1}{10} [(0.007)^2 + (0.003)^2 + (0.003)^2 + (0.012)^2 + (0.02)^2 + (0.023)^2 \\ &\quad + (0.015)^2 + (0.009)^2 + (0.002)^2 + (0.012)^2] \\ &= 0.0001594 \text{ whence } \sigma = 0.0126. \end{aligned}$$

$$\therefore \text{probable error} = \frac{2}{3} \sigma = 0.0084 \text{ approx.}$$

Example 26.50. Fit a normal curve to the following distribution.

$x:$	2	4	6	8	10
$f:$	1	4	6	4	1

(V.T.U., 2001)

Solution.

$$\text{Mean} = \frac{\Sigma f x}{\Sigma f} = \frac{2 + 16 + 36 + 32 + 10}{16} = 6$$

$$\text{S.D.} = \sqrt{\left[\frac{\Sigma f x^2}{\Sigma f} - \left(\frac{\Sigma f x}{\Sigma f} \right)^2 \right]} = \sqrt{(40 - 36)} = 2$$

Taking $\mu = 6$, $\sigma = 2$ and $N = 16$, the equation of the normal curve is

$$y = \frac{1}{\sigma\sqrt{2\pi}} e^{-(x-\mu)^2/2\sigma^2} \text{ or } y = \frac{1}{2\sqrt{2\pi}} e^{-(x-6)^2/8} \quad \dots(i)$$

Area under (i) in (x_1, x_2) or (z_1, z_2)

$$= \frac{1}{\sqrt{2\pi}} \int_{z_1}^{z_2} e^{-z^2/2} dz - \frac{1}{\sqrt{2\pi}} \int_0^{z_1} e^{-z^2/2} dz \quad \text{where } z = \frac{x-6}{2}$$

To evaluate these integrals, we refer to table III.

Calculations :

Mid x	(x_1, x_2)	(z_1, z_2)	Area under (i) in (z_1, z_2)	Expected frequency
2	(1, 3)	(-2.5, -1.5)	0.4938 - 0.4332	$16 \times 0.606 = 0.97$
4	(3, 5)	(-1.5, -0.5)	0.4332 - 0.1915	$16 \times 0.2417 = 3.9$
6	(5, 7)	(-0.5, 0.5)	0.1915 + 0.1915	$16 \times 0.383 = 6.1$
8	(7, 9)	(0.5, 1.5)	0.4332 - 0.1915	$16 \times 0.2417 = 3.9$
10	(9, 11)	(1.5, 2.5)	0.4938 - 0.4332	$16 \times 0.606 = 0.97$

Hence the expected (theoretical) frequencies corrected to nearest integer are 1, 4, 6, 4, 1 which agree with the observed frequencies. This shows that the normal curve (i) is a proper fit to the given distribution.

PROBLEMS 26.7

- Show that the standard deviation for a normal distribution is approximately 25% more than the mean deviation.
 - For a normally distributed variate with mean 1 and S.D. 3, find the probabilities that
 - $3.43 \leq x \leq 6.19$
 - $-1.43 \leq x \leq 6.19$.
 - If x is normally distributed with mean 0 and variance 1, find
 - $P_x(x \leq -1.64)$,
 - x_1 if $P_x(x \geq x_1) = 0.84$.
 - In a certain examination, the percentage of candidates passing and getting distinctions were 45 and 9 respectively. Estimate the average marks obtained by the candidates, the minimum pass and distinction marks being 40 and 75 respectively. (Assume the distribution of marks to be normal). (Kottayam, 2005)
 - A manufacturer of air-mail envelopes knows from experience that the weight of the envelopes is normally distributed with mean 1.95 gm and standard deviation 0.05 gm. About how many envelopes weighing (i) 2 gm or more ; (ii) 2.05 gm or more can be expected in a given packet of 100 envelopes.
 - The mean height of 500 students is 151 cm. and the standard deviation is 15 cm. Assuming that the heights are normally distributed, find how many students' heights lie between 120 and 155 cm. (Burdwan, 2003)
 - The mean and standard deviation of the marks obtained by 1000 students in an examination are respectively 34.4 and 16.5. Assuming the normality of the distribution, find the approximate number of students expected to obtain marks between 30 and 60.
 - In an examination taken by 500 candidates, the average and the standard deviation of marks obtained (normally distributed) are 40% and 10%. Find approximately
 - how many will pass, if 50% is fixed as a minimum ?
 - what should be the minimum if 350 candidates are to pass ?
 - how many have scored marks above 60% ?
 - The mean inside diameter of a sample of 200 washers produced by a machine is 5.02 mm and the standard deviation is 0.05 mm. The purpose for which these washers are intended allows a maximum tolerance in the diameter of 4.96 to 5.08 mm, otherwise the washers are considered defective. Determine the percentage of defective washers produced by the machine, assuming the diameters are normally distributed.
- [Hint.** 4.96 in standard units = $(4.96 - 5.02)/0.05 = -1.2$
 5.08 in standard units = $(5.08 - 5.02)/0.05 = 1.2$
- Proportion of non-defective washers = 2 (area between $z = 0$ and $z = 1.2$)
 = 0.7698 or 77% nearly.
 ∴ percentage of defective washers = $100 - 77 = 23\%$.]
- Assuming that the diameters of 1000 brass plugs taken consecutively from a machine, form a normal distribution with mean 0.7515 cm. and standard deviation 0.0020 cm., how many of the plugs are likely to be rejected if the approved diameter is 0.752 ± 0.004 cm. ? (Bhopal, 2002)

11. It is given that the age of thermostats of a particular make follow the normal law with mean 5 years and S.D. 2 years. 1000 units are sold out every month. How many of them will have to be replaced at the end of the second year.
12. The income of a group of 10,000 persons was found to be normally distributed with mean Rs. 750 p.m., and standard deviation of Rs. 50. Show that, of this group, about 95% had income exceeding Rs. 668 and only 5% had income exceeding Rs. 832. Also find the lowest income among the richest 100. (U.P.T.U., 2004 S)
13. Find the equation of the best fitting normal curve to the following distribution :
- | | | | | | | |
|------|----|----|----|----|----|---|
| $x:$ | 0 | 1 | 2 | 3 | 4 | 5 |
| $y:$ | 13 | 23 | 34 | 15 | 11 | 4 |
14. Obtain the equation of the normal probability curve that may be fitted to the following data :
- | | | | | | | | | | | | |
|------------|---|---|----|----|----|----|----|----|----|----|----|
| Variable : | 4 | 6 | 8 | 10 | 12 | 14 | 16 | 18 | 20 | 22 | 24 |
| Frequency: | 1 | 7 | 15 | 22 | 35 | 43 | 38 | 20 | 13 | 5 | 1 |
15. A factory turns out an article by mass production and it is found that 10% of the product is rejected. Find the S.D. of the number of rejects and the equation to the normal curve to represent the number of rejects.

(Hint. $p = 0.1, q = 0.9, n = 100.$)

∴ binomial distribution of rejects gives mean $= np = 10$, S.D. $= \sqrt{(npq)} = 3$

If this binomial distribution is approximated by a normal distribution, then the equation to the normal curve is

$$y = \frac{100}{\sigma \sqrt{2\pi}} e^{-(x - \mu)^2 / 2\sigma^2} \quad \text{where } \mu = 10, \sigma = 3.$$

16. Given that the probability of committing an error of magnitude x is

$$y = \frac{h}{\sqrt{\pi}} e^{-h^2 z^2}, \text{ show that the probable error is } 0.4769/h.$$

26.18 NORMAL APPROXIMATION TO BINOMIAL DISTRIBUTION

If the number of successes in a Binomial distribution range from x_1 to x_2 , then the probability of getting these successes

$$= \sum_{r=x_1}^{x_2} {}^n C_r p^r q^{n-r}$$

As the number of trials increases, the Binomial distribution becomes approximated to the Normal distribution. The mean np and the variance npq of the binomial distribution will be quite close to the mean and standard deviation of the approximated normal distribution. Thus for n sufficiently large (≥ 30), the binomial distribution with probability of success p , is approximated by the normal distribution with $\mu = np$, $\sigma = \sqrt{npq}$.

We must however, be careful to get the correct values of z . For any success x , real class interval is $(x - 1/2, x + 1/2)$. Hence

$$z_1 = \frac{x_1 - \frac{1}{2} - \mu}{\sigma} = \frac{x_1 - \frac{1}{2} - np}{\sqrt{npq}}; z_2 = \frac{x_2 + \frac{1}{2} - np}{\sqrt{npq}}$$

so that $P(x_1 < x < x_2) = P(z_1 < z < z_2) = \int_{z_1}^{z_2} \phi(z) dz$ which can be calculated by using table III-Appendix 2.

Example 26.51. In a referendum 60% of voters voted in favour. A random sample of 200 voters was selected. What is the probability that in the sample

- (a) more than 130 voted in favour ?
- (b) between 105 and 130 inclusive voted in favour ?
- (c) 120 voted in favour ?

Solution. Here $n = 200, p = 0.6, q = 0.4$

$$\therefore \mu = np = 200 \times 0.6 = 120; \sigma = \sqrt{npq} = \sqrt{48} = 6.928$$

$$(a) P(x > 130) = P(x > 130.5) = P\left(x > \frac{130.5 - 120}{\sqrt{48}}\right) = P(z > 1.516) = 0.0648$$

$$(b) P(105 < x < 130) = P(105.5 < x < 129.5)$$

$$= P\left(\frac{105.5 - 120}{\sqrt{48}} < z < \frac{129.5 - 120}{\sqrt{48}}\right) = P(-2.09 < z < 1.37) = 0.8964$$

$$(c) P(x = 120) = P(119.5 < x < 120.5) \\ = P(-0.072 < z < 0.072) = 0.0575.$$

PROBLEMS 26.8

1. A pair of unbiased dice are rolled 180 times and their score recorded. Find
(a) $P(x \leq 20)$, (b) $P(20 \leq x \leq 40)$, (c) $P(20 < x \leq 30)$.
2. A marksman has a probability of 0.9 of hitting a target on a single shot. If the marksman has 40 shots, what is the probability that he hits the target (a) at least 35 times; (b) between 34 and 36 times; (c) 37 times.
3. A certain drug is effective in 72% of cases. Given 2000 people are treated with the drug, what is the probability that it will be effective for (a) at least 1400 patients, (b) less than 1390 patients, (c) 1420 patients.

26.19 SOME OTHER DISTRIBUTIONS

Discrete distributions

(1) Geometric distribution. If p be the probability of success and k be the numbers of failures preceding the first success then this distribution is

$$P(k) = q^k p, \quad k = 0, 1, 2, \dots, q = 1 - p.$$

$$\text{Obviously } \sum_{k=0}^{\infty} P(k) = p \sum_{k=0}^{\infty} q^k = p \cdot \frac{1}{1-q} = 1.$$

It can easily be shown that mean = q/p , and variance = q/p^2 .

(2) Negative binomial distribution. This distribution gives the probability that the event occurs for the k th time on the r th trial ($r \geq k$). If p be the probability of occurrence of an event then

$$P(k, r) = {}^{r-1}C_{k-1} p^k q^{r-k}.$$

It contains two parameters p and k . If $k = 1$, the Negative binomial distribution reduces to the geometric distribution.

(3) Hypergeometric distribution. Suppose a bag contains m white and n black balls. If r balls are drawn one at a time (*with replacement*), then the probability that k of them will be white is

$$P(k) = {}^m C_k {}^n C_{r-k} / {}^{m+n} C_r, \quad k = 0, 1, \dots, r, r \leq m, r \leq n.$$

This distribution is known as *Hypergeometric distribution*.

$$\text{For } \sum_{k=0}^r P(k) = 1, \text{ since } \sum_{k=0}^r {}^m C_k {}^n C_{r-k} = {}^{m+n} C_r$$

This can be proved by equating the coefficient of t^r in

$$(1+t)^m (t+1)^n = (1+t)^{m+n}$$

Continuous distributions

(4) Uniform (or Rectangular) distribution. A random variable X is said to be uniformly distributed over the interval $-\infty < a < b < \infty$, if its density is given by

$$f(x) = \frac{1}{b-a}, \quad a < x < b \quad \dots(i)$$

The distribution given by (i) is called a *uniform distribution*. In this distribution, X takes the values with the same probability.

$$\text{Its mean } \mu = \int_a^b x \cdot f(x) dx = \frac{1}{b-a} \left| \frac{x^2}{2} \right|_a^b = \frac{a+b}{2}.$$

$$\text{and variance } \sigma^2 = \mu_2' - (\mu)^2 = \int_a^b x^2 \cdot \frac{1}{b-a} dx - \left(\frac{a+b}{2} \right)^2 = \frac{1}{12} (b-a)^2.$$

(5) Gamma distribution. This continuous distribution is given by $f(x) = \frac{\lambda}{\Gamma(r)} (\lambda x)^{r-1} e^{-\lambda x}$ for all $x \geq 0$, where r and λ (both > 0) are called the parameters of the *gamma distribution*. Its mean = r/λ and variance = r/λ^2 .

Gamma distribution tends to normal distribution as the parameter r tends to infinity.

(6) Exponential distribution. This distribution is a special case of gamma distribution when $r = 1$ so that $f(x) = \lambda e^{-\lambda x}$ for $x > 0$, where λ is a parameter.

It can be seen that mean = $1/\lambda$, standard deviation = $1/\lambda$.

This distribution plays an important role in the reliability and queuing theory.

(7) Weibull distribution*. This distribution is given by

$$f(x) = \frac{\alpha}{c} x^{\alpha-1} e^{-x^{\alpha}/c}, x > 0, c > 0$$

where c is a scale parameter and α a shape parameter.

Initially this distribution was used to describe experimentally observed variation in the fatigue resistance of steel and its elastic limits. But it has also been employed to study the variation of length of service of radio service equipment.

Example 26.52. A die is cast until 6 appears. What is the probability that it must be cast more than 5 times?

Solution. Here probability of getting 6 is $p = \frac{1}{6}$. Then $q = \frac{5}{6}$.

If X is the number of tosses required for the first success, then

$$P(X = x) = q^{x-1} p \text{ for } x = 1, 2, 3, \dots$$

∴ required probability = $P(X > 5) = 1 - P(X \leq 5)$

$$= 1 - \sum_{x=1}^5 \left(\frac{5}{6}\right)^{x-1} \cdot \left(\frac{1}{6}\right) = 1 - \frac{1}{6} \left\{ 1 + \frac{5}{6} + \left(\frac{5}{6}\right)^2 + \left(\frac{5}{6}\right)^3 + \left(\frac{5}{6}\right)^4 \right\} = \left(\frac{5}{6}\right)^5.$$

Example 26.53. A random variable X has a uniform distribution over $(-3, 3)$, find k for which

$$P(X > k) = \frac{1}{3}.$$

Also evaluate $P(X < 2)$ and $P(|X - 2| < 2)$.

Solution. (i) Density of

$$X = f(x) = \frac{1}{b-a} = \frac{1}{3 - (-3)} = \frac{1}{6}$$

$$\begin{aligned} \therefore P(X > k) &= 1 - P(X \leq k) = 1 - \int_{-3}^k f(x) dx \\ &= 1 - \frac{1}{6} \int_{-3}^k dx = 1 - \frac{1}{6} (k + 3) = \frac{1}{3} \end{aligned} \quad (\text{given})$$

This gives $k = 1$.

$$(ii) \quad P(X < 2) = \int_{-3}^2 f(x) dx = \frac{1}{6} \int_{-3}^2 dx = \frac{5}{6}.$$

$$(iii) \quad P(|X - 2| < 2) = P[2 - 2 < X < 2 + 2] = P[0 < x < 4] = \int_0^3 f(x) dx = \frac{1}{6} \int_0^3 dx = \frac{1}{2}.$$

PROBLEMS 26.9

1. Show that the mode of the *geometric distribution* $P(x) = \left(\frac{1}{2}\right)^x$, $x = 1, 2, 3, \dots$, is unity.

2. Show that for the *rectangular distribution* $f(x) = 1$, $0 \leq x \leq 1$,

$$\text{mean} = \frac{1}{2}, \text{variance} = \frac{1}{12} \text{ and mean deviation} = \frac{1}{4}$$

* It was first used by Swedish scientist Weibull in 1951.

3. Find the mean and variance of the *uniform distribution* given by $f(x) = 1/n$, $x = 1, 2, \dots, n$.

4. Show that for the *exponential distribution*

$$dP = y_0 e^{-y_0 x}, 0 \leq x \leq \infty,$$

the mean and S.D. are both equal to σ .

5. Find the mean and variance of the *exponential distribution* $f(x) = \frac{1}{b} e^{-(x-a)/b}$, $x > a$. (Mumbai, 2005)

6. Find the moment generating function for the *triangular distribution* given by

$$\begin{aligned} f(x) &= x, & 0 \leq x \leq 1 \\ &= 2-x, & 1 \leq x \leq 2. \end{aligned}$$

7. Show that for the *Gamma distribution* $f(x) = \frac{e^{-x} x^{l-1}}{\Gamma(l)}$, $0 < x < \infty$, the mean and variance are both equal to l .

8. Find the moment generating function of the *Gamma distribution* $f(x) = \frac{1}{\Gamma(\frac{1}{4})} e^{-x} x^{-\frac{3}{4}}$, $x \geq 0$, at the origin.

(J.N.T.U., 2006 ; Madras, 2000 S)

Chebyshev's inequality*. If x is a continuous random variable with mean μ and variance σ^2 , then for any positive real parameter t ,

$$P(|x - \mu| \geq t) \leq \sigma^2/t^2 \text{ or } P(|x - \mu| \leq t) \geq 1 - \sigma^2/t^2.$$

This result is known as *Chebyshev's inequality*. It gives limits to the probability that the value of the variate chosen at random will differ from mean by more than t .

9. For the points on a symmetrical die, prove that *Chebyshev's inequality* gives

$$P(|x - \bar{x}| > 2.5) < 0.478.$$

while the actual probability is zero.

10. For the *Geometrical distribution* $P(x) = 2^{-x}$, $x = 1, 2, 3, \dots$, prove that *Chebyshev's inequality* gives

$$P(|x - 2| < 2) > \frac{1}{2},$$

while the actual probability is $15/16$.

26.20 OBJECTIVE TYPE OF QUESTIONS

PROBLEMS 26.10

Select the correct answer or fill up the blanks in each of the following problems

1. The probability that A happens is $1/3$. The odds against happening of A are

- (a) $2 : 1$ (b) $2 : 3$ (c) $3 : 2$ (d) $5 : 2$.

2. The odds in favour of an event A are 5 to 4. The probability of success of A is

- (a) $4/5$ (b) $5/9$ (c) $4/9$.

3. The probability that A passes a test is $2/3$ and the probability that B passes the same test is $3/5$. The probability that only one of them passes is

- (a) $2/5$ (b) $4/15$ (c) $2/15$ (d) $7/15$.

4. A buys a lottery ticket in which the chance of winning is $1/10$; B has a ticket in which his chance of winning is $1/20$. The chance that atleast one of them wins is

- (a) $1/200$ (b) $29/200$ (c) $30/200$ (d) $170/200$.

5. The probability that a non-leap year should have 53 Tuesdays is ...

6. The probability of getting 2 or 3 or 4 from a throw of single dice is ...

7. The mean of the Binomial distribution with n observations and probability of success p , is

- (a) pq (b) np (c) \sqrt{np} (d) \sqrt{pq} .

8. If the mean of a Poisson distribution is m , then S.D. of this distribution is

- (a) m^2 (b) \sqrt{m} (c) m (d) none of these.

* See footnote on page 571.

9. The S.D. of the Binomial distribution is
 (a) \sqrt{npq} (b) \sqrt{np} (c) npq (d) pq .
10. In a Poisson distribution if $2P(x=1) = P(x=2)$, then the variance is
 (a) 0 (b) 1 (c) 4 (d) 2.
11. If the probability of hitting a target by one shot be $p = 0.8$, then the probability that out of ten shots, seven will hit the target is ...
12. For a Poisson variate $x : P(x=1) = P(x=2)$, then the mean of x is ...
13. If $P(A) = 0.35$, $P(B) = 0.73$ and $P(A \cap B) = 0.14$, then $P(A \cap B') = \dots$
14. If A and B are independent, $P(B) = 0.14$ and $P(A/B) = 0.24$, then $P(A) = \dots$

27.1 (1) INTRODUCTION

We know that a small section selected from the population is called a *sample* and the process of drawing a sample is called *sampling*. It is essential that a sample must be a *random* selection so that each member of the population has the same chance of being included in the sample. Thus the fundamental assumption underlying theory of sampling is *Random sampling*.

A special case of random sampling in which each event has the same probability p of success and the chance of success of different events are independent whether previous trials have been made or not, is known as *simple sampling*.

The statistical constants of the population such as mean (μ), standard deviation (σ) etc. are called the *parameters*. Similarly, constants for the *sample* drawn from the given population i.e., mean (\bar{x}), standard deviation (S) etc. are called the *statistic*. The population parameters are in general, not known and their estimates given by the corresponding sample statistic are used. We use the Greek letters to denote the population parameters and Roman letters for sample statistic.

(2) Objectives of sampling. Sampling aims at gathering the maximum information about the population with the minimum effort, cost and time. The object of sampling studies is to obtain the best possible values of the parameters under specific conditions. Sampling determines the reliability of these estimates. The logic of the sampling theory is the logic of induction in which we pass from a particular (sample) to general (population). Such a generalisation from sample to population is called **Statistical Inference**.

27.2 SAMPLING DISTRIBUTION

Consider all possible samples of size n which can be drawn from a given population at random. For each sample, we can compute the mean. The means of the samples will not be identical. If we group these different means according to their frequencies, the frequency distribution so formed is known as *sampling distribution of the mean*. Similarly we can have *sampling distribution of the standard deviation* etc.

While drawing each sample, we put back the previous sample so that the parent population remains the same. This is called *sampling with replacement* and all the subsequent formulae will pertain to sampling with replacement.

(2) Standard error. The standard deviation of the sampling distribution is called the *standard error* (*S.E.*). Thus the standard error of the sampling distribution of means is called standard error of means. The standard error is used to assess the difference between the expected and observed values. The reciprocal of the standard error is called *precision*.

If $n \geq 30$, a sample is called *large* otherwise *small*. The sampling distribution of large samples is assumed to be normal.

27.3 (1) TESTING A HYPOTHESIS*

To reach decisions about populations on the basis of sample information, we make certain assumptions about the populations involved. Such assumptions, which may or may not be true, are called *statistical hypothesis*. By testing a hypothesis is meant a process for deciding whether to accept or reject the hypothesis. The method consists in assuming the hypothesis as correct and then computing the probability of getting the observed sample. If this probability is less than a certain preassigned value the hypothesis is rejected.

(2) Errors. If a hypothesis is rejected while it should have been accepted, we say that a *Type I error* has been committed. On the other hand, if a hypothesis is accepted while it should have been rejected, we say that a *Type II error* has been made. The statistical testing of hypothesis aims at limiting the Type I error to a preassigned value (say : 5% or 1%) and to minimize the Type II error. The only way to reduce both types of errors is to increase the sample size, if possible.

(3) Null hypothesis. The hypothesis formulated for the sake of rejecting it, under the assumption that it is true, is called the *null hypothesis* and is denoted by H_0 . To test whether one procedure is better than another, we assume that there is no difference between the procedures. Similarly to test whether there is a relationship between two variates, we take H_0 that there is no relationship. By accepting a null hypothesis, we mean that on the basis of the statistic calculated from the sample, we do not reject the hypothesis. It however, does not imply that the hypothesis is proved to be true. Nor its rejection implies that it is disproved.

27.4 (1) LEVEL OF SIGNIFICANCE

The probability level below which we reject the hypothesis is known as the *level of significance*. The region in which a sample value falling in it is rejected, is known as the *critical region*. We generally take two critical regions which cover 5% and 1% areas of the normal curve. The shaded portion in the figure corresponds to 5% level of significance. Thus the *probability of the value of the variate falling in the critical region is the level of significance*.

Depending on the nature of the problem, we use a *single-tail test* or *double-tail test* to estimate the significance of a result. In a double-tail test, the areas of both the tails of the curve representing the sampling distribution are taken into account whereas in the single tail test, only the area on the right of an ordinate is taken into consideration. For instance, to test whether a coin is biased or not, double-tail test should be used, since a biased coin gives either more number of heads than tails (which corresponds to right tail), or more number of tails than heads (which corresponds to left tail only).

(2) Tests of significance. The procedure which enables us to decide whether to accept or reject the hypothesis is called the *test of significance*. Here we test whether the differences between the sample values and the population values (or the values given by two samples) are so large that they signify evidence against the hypothesis or these differences are so small as to account for fluctuations of sampling.

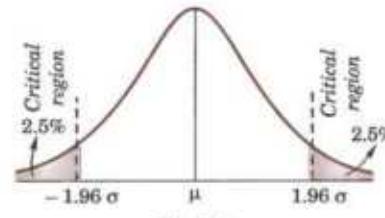

Fig. 27.1

27.5 CONFIDENCE LIMITS**

Suppose that the sampling distribution of a statistic S is normal with mean μ and standard deviation σ . As in the Fig. 27.1 the sample statistic S can be expected to lie in the interval $(\mu - 1.96\sigma, \mu + 1.96\sigma)$ for 95% times i.e., we can be confident of finding μ in the interval $(S - 1.96\sigma, S + 1.96\sigma)$ in 95% cases. Because of this, we call

*The American statistician J. Neyman (1894–1981) and the English statistician E.S. Pearson (1895–1980)—son of Karl Pearson (See footnote p. 843), developed a systematic theory of tests around 1930.

**J. Neyman developed the modern theory and terminology of confidence limits.

$(S - 1.96\sigma, S + 1.96\sigma)$ the 95% confidence interval for estimation of μ . The ends of this interval (i.e. $S \pm 1.96\sigma$) are called 95% confidence limits (or fiducial limits) for S . Similarly $S \pm 2.58\sigma$ are 99% confidence limits. The numbers 1.96, 2.58 etc. are called confidence coefficients. The values of confidence coefficients corresponding to various levels of significance can be found from the normal curve area table VI – Appendix 2.

27.6 SIMPLE SAMPLING OF ATTRIBUTES

The sampling of attributes may be regarded as the selection of samples from a population whose members possess the attribute K or not K . The presence of K may be called a success and its absence a failure.

Suppose we draw a simple sample of n items. Clearly it is same as a series of n independent trials with the same probability p of success. The probabilities of 0, 1, 2, ..., n successes are the terms in the binomial expansion of $(q + p)^n$ where $q = 1 - p$.

We know that the mean of this distribution is np and standard deviation is $\sqrt{(npq)}$ i.e., the expected value of success in a sample of size n is np and the standard error is $\sqrt{(npq)}$.

If we consider the proportion of successes, then

(i) mean proportion of successes = $np/n = p$.

(ii) standard error of the proportion of successes

$$= \sqrt{\left(n \cdot \frac{p}{n} \cdot \frac{q}{n}\right)} = \sqrt{\left(\frac{pq}{n}\right)}$$

and (iii) precision of the proportion of successes = $\sqrt{(n/pq)}$, which varies as \sqrt{n} , since p and q are constants.

27.7 TEST OF SIGNIFICANCE FOR LARGE SAMPLES

We know that the binomial distribution tends to normal for large n . Suppose we wish to test the hypothesis that the probability of success in such trial is p . Assuming it to be true, the mean μ and the standard deviation σ of the sampling distribution of number of successes are np and $\sqrt{(npq)}$ respectively.

For a normal distribution, only 5% of the members lie outside $\mu \pm 1.96\sigma$ while only 1% of the members lie outside $\mu \pm 2.58\sigma$.

If x be the observed number of successes in the sample and z is the standard normal variate then $z = (x - \mu)/\sigma$.

Thus we have the following test of significance :

(i) If $|z| < 1.96$, difference between the observed and expected number of successes is not significant.

(ii) If $|z| > 1.96$, difference is significant at 5% level of significance.

(iii) If $|z| > 2.58$, difference is significant at 1% level of significance.

Example 27.1. A coin was tossed 400 times and the head turned up 216 times. Test the hypothesis that the coin is unbiased at 5% level of significance. (V.T.U., 2007)

Solution. Suppose the coin is unbiased.

Then the probability of getting the head in a toss = $\frac{1}{2}$

∴ expected number of successes = $\frac{1}{2} \times 400 = 200$

and the observed value of successes = 216

Thus the excess of observed value over expected value = $216 - 200 = 16$

Also S.D. of simple sampling = $\sqrt{(npq)} = \sqrt{\left(400 \times \frac{1}{2} \times \frac{1}{2}\right)} = 10$

Hence $z = \frac{x - np}{\sqrt{(npq)}} = \frac{16}{10} = 1.6$

As $z < 1.96$, the hypothesis is accepted at 5% level of significance i.e., we conclude that the coin is unbiased at 5% level of significance.

Example 27.2. A die was thrown 9000 times and a throw of 5 or 6 was obtained 3240 times. On the assumption of random throwing, do the data indicate an unbiased die? (V.T.U., 2010)

Solution. Suppose the die is unbiased.

Then the probability of throwing 5 or 6 with one die = $\frac{1}{3}$

The expected number of successes = $\frac{1}{3} \times 9000 = 3000$

and the observed value of successes = 3240

Thus the excess of observed value over expected value $3240 - 3000 = 240$

Also S.D. of simple sampling = $\sqrt{npq} = \sqrt{9000 \times \frac{1}{3} \times \frac{2}{3}} = 44.72$

Hence $z = \frac{x - np}{\sqrt{npq}} = \frac{240}{44.72} = 5.4$ nearly.

As $z > 2.58$, the hypothesis has to be rejected at 1% level of significance and we conclude that the die is biased.

Example 27.3. In a locality containing 18000 families, a sample of 840 families was selected at random. Of these 840 families, 206 families were found to have a monthly income of ₹ 250 or less. It is desired to estimate how many out of 18,000 families have a monthly income of ₹ 250 or less. Within what limits would you place your estimate?

Solution. Here $p = \frac{206}{840} = \frac{103}{420}$ and $q = \frac{317}{420}$

∴ standard error of the population of families having a monthly income of ₹ 250 or less

$$= \sqrt{\left(\frac{pq}{n}\right)} = \sqrt{\left(\frac{103}{420} \times \frac{317}{420} \times \frac{1}{840}\right)} = .015 = 1.5\%$$

Hence taking $\frac{103}{420}$ (or 24.5%) to be the estimate of families having a monthly income of ₹ 250 or less in the locality, the limits are $(24.5 \pm 3 \times 1.5)\%$ i.e., 20% and 29% approximately.

27.8 COMPARISON OF LARGE SAMPLES

Two large samples of sizes n_1, n_2 are taken from two populations giving proportions of attributes A's as p_1, p_2 respectively.

(a) On the hypothesis that the populations are similar as regards the attribute A, we combine the two samples to find an estimate of the common value of proportion of A's in the populations which is given by

$$p = \frac{n_1 p_1 + n_2 p_2}{n_1 + n_2}$$

If e_1, e_2 be the standard errors in the two samples then

$$e_1^2 = \frac{pq}{n_1} \text{ and } e_2^2 = \frac{pq}{n_2}$$

If e be the standard error of the difference between p_1 and p_2 , then

$$e^2 = e_1^2 + e_2^2 = pq \left(\frac{1}{n_1} + \frac{1}{n_2} \right) \therefore z = \frac{p_1 - p_2}{e}$$

If $z > 3$, the difference between p_1 and p_2 is real one.

If $z < 2$, the difference may be due to fluctuations of simple sampling.

But if z lies between 2 and 3, then the difference is significant at 5% level of significance.

(b) If the proportions of A's are not the same in the two populations from which the samples are drawn, but p_1 and p_2 are the true values of proportions then S.E. e of the difference $p_1 - p_2$ is given by

$$e^2 = \frac{p_1 q_1}{n_1} + \frac{p_2 q_2}{n_2}$$

If $z = \frac{p_1 - p_2}{e} < 3$, the difference could have arisen due to fluctuations of simple sampling.

Example 27.4. In a city A 20% of a random sample of 900 school boys had a certain slight physical defect. In another city B, 18.5% of a random sample of 1600 school boys had the same defect. Is the difference between the proportions significant ? (V.T.U., 2003 S)

Solution. We have $n_1 = 900, n_2 = 1600$

and

$$p_1 = \frac{20}{100} = \frac{1}{5}, p_2 = \frac{18.5}{100}$$

$$\therefore p = \frac{n_1 p_1 + n_2 p_2}{n_1 + n_2} = \frac{180 + 296}{900 + 1600} = 0.19$$

and

$$q = 1 - 0.19 = 0.81$$

Thus $e^2 = pq \left(\frac{1}{n_1} + \frac{1}{n_2} \right) = 0.19 \times 0.81 \left(\frac{1}{900} + \frac{1}{1600} \right) = 0.0017$

giving

$$e = 0.04 \text{ nearly.}$$

Also $p_1 - p_2 = \frac{1.5}{100} = 0.015 \quad \therefore z = \frac{p_1 - p_2}{e} = \frac{.015}{.04} = 0.37$

As $z < 1$, the difference between the proportions is not significant.

Example 27.5. In two large populations there are 30% and 25% respectively of fair haired people. Is this difference likely to be hidden in samples of 1200 and 900 respectively from the two populations ?

(Coimbatore, 2001)

Solution. Here $p_1 = 0.3, p_2 = 0.25$ so that $p_1 - p_2 = 0.05$.

$$\therefore e^2 = \frac{p_1 q_1}{n_1} + \frac{p_2 q_2}{n_2} = \frac{0.3 \times 0.7}{1200} + \frac{0.25 \times 0.75}{900}$$

so that

$$e = 0.0195$$

$$\therefore z = \frac{p_1 - p_2}{e} = \frac{0.05}{0.0195} = 2.5 \text{ nearly}$$

Hence it is unlikely that the real difference will be hidden.

PROBLEMS 27.1

1. A die is tossed 960 times and it falls with 5 upwards 184 times. Is the die biased ? (V.T.U., 2006)
2. 12 dice are thrown 3086 times and a throw of 2, 3, 4 is reckoned as a success. Suppose that 19142 throws of 2, 3, 4 have been made out. Do you think that this observed value deviates from the expected value ? If so, can the deviation from the expected value be due to fluctuations of simple sampling ?
3. Balls are drawn from a bag containing equal number of black and white balls, each ball being replaced before drawing another. In 2250 drawings 1018 black and 1232 white balls have been drawn. Do you suspect some bias on the part of the drawer ?
4. A sample of 1000 days is taken from meteorological records of a certain district and 120 of them are found to be foggy. What are the probable limits to the percentage of foggy days in the district ?
5. In a group of 50 first cousins there were found to be 27 males and 23 females. Ascertain if the observed proportions are inconsistent with the hypothesis that the sexes should be in equal proportion.
6. A random sample of 500 apples was taken from a large consignment and 65 were found to be bad. Estimate the proportion of the bad apples in the consignment as well as the standard error of the estimate. Deduce that the percentage of bad apples in the consignment almost certainly lies between 8.5 and 17.5.
7. 400 children are chosen in an industrial town and 150 are found to be under weight. Assuming the conditions of simple sampling, estimate the percentage of children who are under weight in the industrial town and assign limits within which the percentage probably lies ?

8. A machine produces 16 imperfect articles in a sample of 500. After machine is overhauled, it produces 3 imperfect articles in a batch of 100. Has the machine been improved? (Rohtak, 2005; Madras, 2003)
9. One type of aircraft is found to develop engine trouble in 5 flights out of a total of 100 and another type in 7 flights out of a total of 200 flights. Is there a significant difference in the two types of aircrafts so far as engine defects are concerned?
10. In a sample of 600 men from a certain city, 450 are found smokers. In another sample of 900 men from another city, 450 are smokers. Do the data indicate that the cities are significantly different with respect to the habit of smoking among men? (J.N.T.U., 2003)
11. In a sample of 500 people from a state 280 take tea and rest take coffee. Can we assume that tea and coffee are equally popular in the state at 5% level of significance?

27.9 (1) SAMPLING OF VARIABLES

We now consider sampling of a variable such as weight, height, etc. Each member of the population gives a value of the variable and the population is a frequency distribution of the variable. Thus a random sample of size n from the population is same as selecting n values of the variables from those of the distribution.

(2) Sampling distribution of the mean. If a population is distributed normally with mean μ and standard deviation σ , then the means of all positive random samples of size n , are also distributed normally with mean μ and standard error σ/\sqrt{n} . This result shows how the precision of a sample mean increases as the sample size increases.

27.10 CENTRAL LIMIT THEOREM

This is a very important theorem regarding the distribution of the mean of a sample if the parent population is non-normal and the sample size is large.

If the variable X has a non-normal distribution with mean μ and standard deviation σ , then the limiting distribution of

$$z = \frac{\bar{x} - \mu}{\sigma/\sqrt{n}} \text{ as } n \rightarrow \infty, \text{ is the standard normal distribution (i.e., with mean 0 and unit S.D.)}$$

There is no restriction upon the distribution of X except that it has a finite mean and variance. This theorem holds well for a sample of 25 or more which is regarded as large.

Thus if the population is normal, the sampling distribution of the mean is also normal with mean μ and S.E. σ/\sqrt{n} , while for large samples the same result holds even if the distribution of the population is non-normal. This property is of universal use and throws light on the importance of normal distribution in statistical theory.

27.11 CONFIDENCE LIMITS FOR UNKNOWN MEAN

Let the population from which a random sample of size n is drawn, have mean μ and S.D. σ . If μ is not known, there will be a range of values of μ for which observed mean \bar{x} of the sample is not significant at any assigned level of probability. The relative deviation of \bar{x} from μ is $(\bar{x} - \mu)/\sqrt{\sigma}$.

If \bar{x} is not significant at 5% level of probability, then

$$|(\bar{x} - \mu)/\sqrt{n}/\sigma| < 1.96 \quad \text{i.e. } \bar{x} - 1.96\sigma/\sqrt{n} < \mu < \bar{x} + 1.96\sigma/\sqrt{n}$$

Thus 95% confidence or fiducial limits for the mean of the population corresponding to given sample are $\bar{x} \pm 1.96\sigma/\sqrt{n}$.

Similarly 99% confidence limits for μ are $\bar{x} \pm 2.58\sigma/\sqrt{n}$.

Example 27.6. A sample of 900 members is found to have a mean of 3.4 cm. Can it be reasonably regarded as a truly random sample from a large population with mean 3.25 cm and S.D. 1.61 cm.

Solution. Here $\bar{x} = 3.4$ cm, $n = 900$, $\mu = 3.25$ and $\sigma = 1.61$ cm

$$\therefore z = \frac{\bar{x} - \mu}{\sigma/\sqrt{n}} = \frac{3.4 - 3.25}{1.61/30} = 2.8$$

As $z > 1.96$, the deviation of the sample mean from the mean of the population is significant at 5% level of significance. Hence it cannot be regarded as a random sample.

Example 27.7. The mean of a certain normal population is equal to the standard error of the mean of the samples of 100 from that distribution. Find the probability that the mean of the sample of 25 from the distribution will be negative?

Solution. If μ be the mean and σ the S.D. of the distribution, then

$$\mu = \text{S.E. of the sample means} = \frac{\sigma}{\sqrt{100}} = \frac{\sigma}{10}$$

$$\text{Also for a sample of size 25, we have } z = \frac{\bar{x} - \mu}{\sigma/\sqrt{25}} = \frac{\bar{x} - \sigma/10}{6/5} = \frac{5\bar{x}}{\sigma} - \frac{1}{2}$$

Since \bar{x} is negative, $z < -\frac{1}{2}$.

∴ the probability that a normal variate $z < -\frac{1}{2}$

$$= -\frac{1}{\sqrt{2\pi}} \int_{-\infty}^{-\frac{1}{2}} e^{-\frac{1}{2}z^2} dz = \frac{1}{\sqrt{2\pi}} \int_{\frac{1}{2}\infty}^{\infty} e^{-\frac{1}{2}z^2} dz \\ = 0.5 - 0.915 = 0.3085, \text{ from the tables.}$$

Example 27.8. An unbiased coin is thrown n times. It is desired that the relative frequency of the appearance of heads should lie between 0.49 and 0.51. Find the smallest value of n that will ensure this result with 90% confidence.

$$\text{Solution. S.E. of the proportion of heads} = \sqrt{\frac{pq}{n}} = \sqrt{\frac{1}{2} \cdot \frac{1}{2} \cdot \frac{1}{n}} = \frac{1}{2\sqrt{n}}$$

90% of confidence = 45% or .45 of the total area under the normal curve on each side of the mean.

∴ the corresponding value of $z = 1.645$, from the tables.

Thus $p + 1.645\sigma = 0.49$ or 0.51.

$$\text{i.e., } 0.5 - 1.645 \cdot \frac{1}{2\sqrt{n}} = 0.49 \quad \text{and} \quad 0.5 + 1.645 \cdot \frac{1}{2\sqrt{n}} = 0.51$$

$$\text{whence } \frac{1.645}{2\sqrt{n}} = 0.01 \quad \text{or} \quad \sqrt{n} = \frac{329}{4} \quad \text{or} \quad n = 6765 \text{ approximately.}$$

27.12 TEST OF SIGNIFICANCE FOR MEANS OF TWO LARGE SAMPLES

(a) Suppose two random samples of sizes n_1 and n_2 have been drawn from the same population with S.D. σ . We wish to test whether the difference between the sample means \bar{x}_1 and \bar{x}_2 is significant or is merely due to fluctuations of sampling.

If the samples are independent, then the standard error e of the difference of their means is given by

$$e^2 = e_1^2 + e_2^2$$

where $e_1 = \sigma/\sqrt{n_1}$, $e_2 = \sigma/\sqrt{n_2}$ are the S.E.s of the means of the two samples.

$$\therefore e = \sigma \sqrt{\left(\frac{1}{n_1} + \frac{1}{n_2} \right)}. \quad \text{Hence } z = \frac{\bar{x}_1 - \bar{x}_2}{\sigma \sqrt{(1/n_1 + 1/n_2)}}$$

is normally distributed with mean zero and S.D. 1.

Test of significance (n_1, n_2 being large) :

If $z > 1.96$, then the difference is significant at 5% level of significance.

If $z > 3$, it is highly probable that either the samples have not been drawn from the same population or the sampling is not simple.

(b) If the samples are known to be drawn from different populations with means μ_1 , μ_2 and standard deviations σ_1 and σ_2 . Then the standard error e of their means is given by

$$e = \sqrt{\left(\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}\right)}$$

Assuming that the two populations have the same mean (i.e., $\mu_1 = \mu_2$), the difference of the means of the samples will be normally distributed with mean zero and S.D. e . Now the same procedure of test of significance is applied.

Example 27.9. The means of simple samples of sizes 1000 and 2000 are 67.5 and 68.0 cm respectively. Can the samples be regarded as drawn from the same population of S.D. 2.5 cm. (Madras, 2002)

Solution. We have $\bar{x}_1 = 67.5$, $\bar{x}_2 = 68.0$
 $n_1 = 1000$, $n_2 = 2000$.

On the hypothesis, that the samples are drawn from the same population of S.D. $\sigma = 2.5$, we get

$$\begin{aligned} z &= \frac{\bar{x}_1 - \bar{x}_2}{\sigma \sqrt{\left(\frac{1}{n_1} + \frac{1}{n_2}\right)}} = \frac{67.5 - 68.0}{2.5 \sqrt{\left(\frac{1}{1000} + \frac{1}{2000}\right)}} \\ &= \frac{0.5}{2.5 \times 0.0387} = \frac{0.5}{0.09675} = 5.1 \end{aligned}$$

Hence the difference between the sample means i.e., 5.1 is very much greater than 1.96 and is therefore significant. Thus, the samples cannot be regarded as drawn from the same population.

Example 27.10. A sample of height of 6400 soldiers has a mean of 67.85 inches and a standard deviation of 2.56 inches while a simple sample of heights of 1600 sailors has a mean of 68.55 inches and a standard deviation of 2.52 inches. Do the data indicate that the sailors are on the average taller than soldiers?

Solution. Here $\bar{x}_1 = 67.85$, $\sigma_1 = 2.56$, $n_1 = 6400$
 $\bar{x}_2 = 68.55$, $\sigma_2 = 2.52$, $n_2 = 1600$.

∴ S.E. of the difference of the mean heights is

$$\begin{aligned} e &= \sqrt{\left(\frac{\sigma_1^2}{n_1} + \frac{\sigma_2^2}{n_2}\right)} = \sqrt{\left[\frac{(2.56)^2}{6400} + \frac{(2.52)^2}{1600}\right]} \\ &= \sqrt{[0.001024 + 0.003969]} = 0.005 \text{ nearly.} \end{aligned}$$

Also difference between the means = $\bar{x}_2 - \bar{x}_1 = 0.7$, which $> 10e$. This is highly significant. Hence the data indicates that the sailors are on the average taller than the soldiers.

PROBLEMS 27.2

- A sample of 400 items is taken from a normal population whose mean is 4 and variance 4. If the sample mean is 4.45, can the samples be regarded as a simple sample?
- To know the mean weights of all 10-year old boys in Delhi, a sample of 225 is taken. The mean weight of the sample is found to be 67 pounds with a S.D. of 12 pounds. Can you draw any inference from it about the mean weight of the population?
- A normal population has a mean 0.1 and a S.D. of 2.1. Find the probability that the mean of simple sample of 900 members will be negative.
- If the mean breaking strength of copper wire is 575 lbs. with a standard deviation of 8.3 lbs., how large a sample must be used in order that there be one chance in 100 that the mean breaking strength of the sample is less than 572 lbs.?

Hint. $|z| = \left| \frac{\bar{x} - \mu}{\sigma} \sqrt{n} \right| = \frac{3}{8.3} \sqrt{n}$

Also from table IV, $z = 2.33$. Hence $n = 42$ nearly.]

5. A research worker wishes to estimate mean of a population by using sufficiently large sample. The probability is 95% that sample mean will not differ from the true mean by more than 25% of the S.D. How large a sample should be taken?
6. The density function of a random variable x is $f(x) = ke^{-2x^2 + 10x}$. Find the upper 5% point of the distribution of the means of the random sample of size 25 from the above population.
7. The means of two large samples of 1000 and 2000 members are 168.75 cms. and 170 cms. respectively. Can the samples be regarded as drawn from the same population of standard deviation 6.25 cms.
8. If 60 new entrants in a given university are found to have a mean height of 68.60 inches and 50 seniors a mean height of 69.51 inches; is the evidence conclusive that the mean height of the seniors is greater than that of the new entrants? Assume the standard deviation of height to be 2.48 inches.
9. A sample of 100 electric bulbs produced by manufacturer A showed a mean life time of 1190 hours and a standard deviation of 90 hours. A sample of 75 bulbs produced by manufacturer B showed a mean life time of 1230 hours, with a standard deviation of 120 hours. Is there a difference between the mean life time of two brands at a significance level of (i) 0.05 (ii) 0.01.
10. A random sample of 1000 men from North India shows that their mean wage is ₹ 5 per day with a S.D. of ₹ 1.50. A sample of 1500 men from South India gives a mean wage of ₹ 4.50 per day with a standard deviation of ₹ 2. Does the mean rate of wages varies as between the two regions?

27.13 SAMPLING OF VARIABLES—SMALL SAMPLES

In case of large samples, sampling distribution approaches a normal distribution and values of sample statistic are considered best estimates of the parameters in a population. It will no longer be possible to assume that statistics computed from small samples are normally distributed. As such, a new technique has been devised for small samples which involves the concept of 'degrees of freedom' which we explain below.

Number of degrees of freedom is the number of values in a set which may be assigned arbitrarily. For instance, if $x_1 + x_2 + x_3 = 15$ and we assign any values of two of the variables (say : x_1, x_2), then the values of x_3 will be known. The two variables are therefore, free and independent choices for finding the third. Hence these are the degrees of freedom. If there are n observations, the degrees of freedom (d.f.) are $(n - 1)$. In other words, while finding the mean of a small sample, one degree of freedom is used up and $(n - 1)$ d.f. are left to estimate the population variance.

27.14 (1) STUDENT'S t-DISTRIBUTION

Consider a small sample of size n , drawn from a normal population with mean μ and s.d. σ . If \bar{x} and σ_s be the sample mean and s.d., then the statistic, ' t ' is defined as

$$t = \frac{\bar{x} - \mu}{\sigma_s / \sqrt{n}} \quad \text{or} \quad t = \frac{\bar{x} - \mu}{\sigma_s} \sqrt{(n - 1)},$$

where $v = n - 1$ denotes the d.f. of t . If we calculate t for each sample, we obtain the sampling distribution for t . This distribution known as *Student's t-distribution**, is given by

$$y = \frac{y_0}{(1 + t^2/v)^{(v+1)/2}} \quad \dots(1)$$

where y_0 is constant such that the area under the curve is unity.

(2) Properties of t-distribution.

I. This curve is symmetrical about the line $t = 0$, like the normal curve, since only even powers of t appear in (1). But it is more peaked than the normal curve with the same S.D. The t -curve approaches the horizontal axis less rapidly than the normal curve. Also t -curve attains its maximum value at $t = 0$ so that its mode coincides with the mean. (Fig. 27.2)

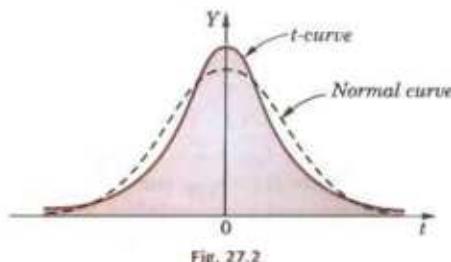

Fig. 27.2

*This distribution was first found by the English statistician W.S. Gosset in 1908 who wrote under the pen-name of 'Student'. R.A. Fisher defined t correctly and found its distribution in 1926.

II. The limiting form of t -distribution when $v \rightarrow \infty$ is given by $y = y_0 e^{-\frac{1}{2}t^2}$ which is a normal curve. This shows that t is normally distributed for large samples.

III. The probability P that the value of t will exceed t_0 is given by

$$P = \int_{t_0}^{\infty} y \, dx$$

The values of t_0 have been tabulated for various values of P for various values of v from 1 to 30 (Table IV – Appendix 2).

IV. Moments about the mean

All the moments of odd order about the mean are zero, due to its symmetry about the line $t = 0$.

Even order moments about the mean are

$$\mu_2 = \frac{v}{v-2}, \quad \mu_4 = \frac{3v^2}{(v-2)(v-4)} \dots$$

The t -distribution is often used in tests of hypothesis about the mean when the population standard deviation σ is unknown.

27.15 SIGNIFICANCE TEST OF A SAMPLE MEAN

Given a random small sample $x_1, x_2, x_3, \dots, x_n$ from a normal population, we have to test the hypothesis that mean of the population is μ . For this, we first calculate $t = (\bar{x} - \mu) / \sqrt{n}/\sigma_s$

where $\bar{x} = \frac{1}{n} \sum_{i=1}^n x_i, \quad \sigma_s^2 = \frac{1}{n-1} \sum_{i=1}^n (x_i - \bar{x})^2$

Then find the value of P for the given df from the table.

If the calculated value of $t > t_{0.05}$, the difference between \bar{x} and μ is said to be significant at 5% level of significance.

If $t > t_{0.01}$, the difference is said to be significant at 1% level of significance.

If $t < t_{0.05}$, the data is said to be consistent with the hypothesis that μ is the mean of the population.

Example 27.11. A certain stimulus administered to each of 12 patients resulted in the following increases of blood pressure: 5, 2, 8, -1, 3, 0, -2, 1, 5, 0, 4, 6. Can it be concluded that the stimulus will in general be accompanied by an increase in blood pressure. (V.T.U., 2007)

Solution. Let us assume that the stimulus administered to all the 12 patients will increase the B.P. Taking the population to be normal with mean $\mu = 0$ and S.D. σ ,

$$\bar{d} = \frac{5 + 2 + 8 - 1 + 3 + 0 - 2 + 1 + 5 + 0 + 4 + 6}{12} = 2.583$$

$$\sigma^2 = \frac{\Sigma d^2}{n} - \bar{d}^2 = \frac{1}{12} [5^2 + 2^2 + 8^2 + (-1)^2 + 3^2 + 0^2 + (-2)^2 + 1^2 + 5^2 + 0^2 + 4^2 + 6^2] - (2.583)^2 \\ = 8.744. \quad \therefore \quad \sigma = 2.9571$$

$$\text{Now } t = \frac{\bar{d} - \mu}{\sigma_s} = \frac{2.583 - 0}{2.9571} \sqrt{(12-1)} = 2.897$$

Here $d.f. \gamma = 12 - 1 = 11$.

For $\gamma = 11$, $t_{0.05} = 2.2$, from table IV.

Since the $|t| > t_{0.05}$, our assumption is rejected i.e., the stimulus does not increase the B.P.

Example 27.12. The nine items of a sample have the following values : 45, 47, 50, 52, 48, 47, 49, 53, 51. Does the mean of these differ significantly from the assumed mean of 47.5 ? (V.T.U., 2010)

Solution. We find the mean and standard deviation of the sample as follows :

x	d = x - 48	d ²
45	-3	9
47	-1	1
50	2	4
52	2	4
48	0	0
47	-1	1
49	1	1
53	5	25
51	3	9
Total	10	66

$$\therefore \bar{x} = \text{mean} = 48 + \frac{\sum d}{9} = 48 + \frac{10}{9} = 49.1$$

$$\sigma_s^2 = \frac{\sum d^2}{9} - \left(\frac{\sum d}{9} \right)^2 = \frac{66}{9} - \frac{100}{81} = \frac{494}{81}$$

$$\therefore \sigma_s = 2.47$$

$$\text{Hence } t = \frac{\bar{x} - \mu}{\sigma_s} \sqrt{(n-1)} = \frac{49.1 - 47.5}{2.47} \sqrt{8} = 1.83$$

Here $d.f. v = 9 - 1 = 8$

For $v = 8$, we get from table IV, $t_{0.05} = 2.31$.

As calculated value of $t < t_{0.05}$, the value of t is not significant at 5% level of significance which implies that there is no significant difference between \bar{x} and μ . Thus the test provides no evidence against the population mean being 47.5.

Example 27.13. A machinist is making engine parts with axle diameter of 0.7 inch. A random sample of 10 parts shows mean diameter 0.742 inch with a standard deviation of 0.04 inch. On the basis of this sample, would you say that the work is inferior ? (V.T.U., 2009)

Solution. Here we have $\mu = 0.700$, $\bar{x} = 0.742$, $\sigma_s = 0.040$, $n = 10$.

Taking the hypothesis that the product is not inferior i.e., there is no significant difference between \bar{x} and μ .

$$\therefore t = \frac{\bar{x} - \mu}{\sigma_s} \sqrt{(n-1)} = \frac{0.742 - 0.700}{0.040} \sqrt{(10-1)} = \frac{0.126}{0.040} = 3.16$$

Degrees of freedom $p = 10 - 1 = 9$.

For $p = 9$, we get from table IV, $t_{0.05} = 2.262$.

As the calculated value of $t > t_{0.05}$, the value of t is significant at 5% level of significance. This implies that \bar{x} differs significantly from μ and the hypothesis is rejected. Hence the work is inferior. In fact, the work is inferior even at 2% level of significance.

Example 27.14. Show that 95% confidence limits for the mean μ of the population are $\bar{x} \pm \frac{\sigma_s}{\sqrt{n}} t_{0.05}$.

Deduce that for a random sample of 16 values with mean 41.5 inches and the sum of the squares of the deviations from the mean 135 inches² and drawn from a normal population, 95% confidence limits for the mean of the population are 39.9 and 43.1 inches.

Solution. (a) The probability P that $t \leq t_{0.05}$ is 0.95. Hence the 95% confidence limits for μ are given by

$$\left| \frac{\bar{x} - \mu}{\sigma_s} \sqrt{n} \right| \leq t_{0.05}$$

or

$$\left| \bar{x} - \mu \right| \leq \frac{\sigma_s}{\sqrt{n}} t_{0.05} \quad \text{or} \quad \bar{x} - \frac{\sigma_s}{\sqrt{n}} t_{0.05} \leq \mu \leq \bar{x} + \frac{\sigma_s}{\sqrt{n}} t_{0.05}$$

We can, therefore, say with a confidence coefficient 0.95 that the confidence interval $\bar{x} \pm \frac{\sigma_s}{\sqrt{n}} t_{0.05}$ contains the population mean μ .

$$(b) \text{ Here, } n = 16, v = n - 1 = 15, \sigma_s = \sqrt{\frac{135}{15}} = 3.$$

Also from table IV, $t_{0.05}$ (for $v = 15$) = 2.13

$$\therefore \frac{\sigma_s}{\sqrt{n}} t_{0.05} = \frac{3}{4} \times 2.13 = 1.6 \text{ approx.}$$

Hence the required confidence limits are 41.5 ± 1.6 i.e., 39.9 and 43.1 inches.

27.16 SIGNIFICANCE TEST OF DIFFERENCE BETWEEN SAMPLE MEANS

Given two independent samples $x_1, x_2, x_3, \dots, x_{n_1}$ and y_1, y_2, \dots, y_{n_2} with means \bar{x} and \bar{y} and standard deviations σ_x and σ_y from a normal population with the same variance, we have to test the hypothesis that the population means μ_1 and μ_2 are the same.

For this, we calculate $t = \frac{\bar{x} - \bar{y}}{\sigma \sqrt{\left(\frac{1}{n_1} + \frac{1}{n_2}\right)}}$... (1)

$$\text{where } \bar{x} = \frac{1}{n_1} \sum_{i=1}^{n_1} x_i, \bar{y} = \frac{1}{n_2} \sum_{j=1}^{n_2} y_j$$

$$\text{and } \sigma_s^2 = \frac{1}{n_1 + n_2 - 2} \left[(n_1 - 1)\sigma_x^2 + (n_2 - 1)\sigma_y^2 \right] = \frac{1}{n_1 + n_2 - 2} \left\{ \sum_{i=1}^{n_1} (x_i - \bar{x})^2 + \sum_{j=1}^{n_2} (y_j - \bar{y})^2 \right\}$$

It can be shown that the variate t defined by (1) follows the t -distribution with $n_1 + n_2 - 2$ degrees of freedom.

If the calculated value of $t > t_{0.05}$, the difference between the sample means is said to be significant at 5% level of significance.

If $t > t_{0.01}$, the difference is said to be significant at 1% level of significance.

If $t < t_{0.05}$, the data is said to be consistent with the hypothesis, that $\mu_1 = \mu_2$.

Cor. If the two samples are of the same size and the data are paired, then t is defined by

$$t = \frac{\bar{d} - 0}{(\sigma/\sqrt{n})} \quad \text{where} \quad \sigma^2 = \frac{1}{n-1} \sum_{i=1}^n (d_i - \bar{d})^2$$

d_i = difference of the i th members of the samples ;

\bar{d} = mean of the differences = $\Sigma d_i/n$; and the number of d.f. = $n - 1$.

Example 27.15. Eleven students were given a test in statistics. They were given a month's further tuition and a second test of equal difficulty was held at the end of it. Do the marks give evidence that the students have benefitted by extra coaching?

Boys	:	1	2	3	4	5	6	7	8	9	10	11
Marks I test	:	23	20	19	21	18	20	18	17	23	16	19
Marks II test	:	24	19	22	18	20	22	20	20	23	20	17

(V.T.U., 2011 S)

Solution. We compute the mean and the S.D. of the difference between the marks of the two tests as under :

$$\bar{d} = \text{mean of } d\text{'s} = \frac{11}{11} = 1; \sigma_s^{-2} = \frac{\Sigma (d - \bar{d})^2}{n-1} = \frac{50}{10} = 5 \quad \text{i.e., } \sigma_s = 2.24$$

Assuming that the students have not been benefited by extra coaching, it implies that the mean of the difference between the marks of the two tests is zero i.e., $\mu = 0$.

Then $t = \frac{\bar{d} - \mu}{\sigma_d} \sqrt{n} = \frac{1 - 0}{2.24} \sqrt{11} = 1.48$ nearly and $df v = 11 - 1 = 10$.

Students	x_1	x_2	$d = x_2 - x_1$	$d - \bar{d}$	$(d - \bar{d})^2$
1	23	24	1	0	0
2	20	19	-1	-2	4
3	19	22	3	2	4
4	21	18	-3	-4	16
5	18	20	2	1	1
6	20	22	2	1	1
7	18	20	2	1	1
8	17	20	3	2	4
9	23	23	—	-1	1
10	16	20	4	3	9
11	19	17	-2	-3	9
			$\Sigma d = 11$		$\Sigma(d - \bar{d})^2 = 50$

From table IV, we find that $t_{0.05}$ (for $v = 10$) = 2.228. As the calculated value of $t < t_{0.05}$, the value of t is not significant at 5% level of significance i.e., the test provides no evidence that the students have benefited by extra coaching.

Example 27.16. From a random sample of 10 pigs fed on diet A, the increases in weight in a certain period were 10, 6, 16, 17, 13, 12, 8, 14, 15, 9 lbs. For another random sample of 12 pigs fed on diet B, the increases in the same period were 7, 13, 22, 15, 12, 14, 18, 8, 21, 23, 10, 17 lbs. Test whether diets A and B differ significantly as regards their effect on increases in weight?

Solution. We calculate the means and standard deviations of the samples as follows :

	Diet A			Diet B	
x_i	$x_i - \bar{x}$	$(x_i - \bar{x})^2$	y_i	$y_i - \bar{y}$	$(y_i - \bar{y})^2$
10	-2	4	7	-8	64
6	-6	36	13	-2	4
16	4	16	22	7	49
17	5	25	15	0	0
13	1	1	12	-3	9
12	0	0	14	-1	1
8	-4	16	18	3	9
14	2	4	8	-7	49
15	3	9	21	6	36
9	-3	9	23	8	64
			10	-5	25
			17	2	4
120	0	120	180	0	314

$$\bar{x} = \frac{120}{10} = 12 \text{ lbs.}, \bar{y} = \frac{180}{12} = 15 \text{ lbs.}$$

$$\begin{aligned}\sigma_s^2 &= [\Sigma(x_i - \bar{x})^2 + \Sigma(y_i - \bar{y})^2]/(n_1 + n_2 - 2) \\ &= (120 + 314)/(10 + 12 - 2) = (434/20) = 21.1 \\ \therefore \sigma_s &= 4.65\end{aligned}$$

Assuming that the samples do not differ in weight so far as the two diets are concerned i.e., $\mu_1 - \mu_2 = 0$.

Hence $t = \frac{(\bar{y} - \bar{x}) - 0}{\sigma_s \sqrt{\left(\frac{1}{n_1} + \frac{1}{n_2}\right)}} = \frac{15 - 12}{4.65 \sqrt{\left(\frac{1}{10} + \frac{1}{12}\right)}} = \frac{3}{4.65} \sqrt{\frac{120}{22}} = 1.6 \text{ nearly}$

Here $d.f. v = n_1 + n_2 - 2 = 10 + 12 - 2 = 20$.

For $v = 20$, we find $t_{0.05} = 2.09$

[From table IV]

\therefore the calculated value of $t < t_{0.05}$.

Hence the difference between the sample means is not significant i.e., the two diets do not differ significantly as regards their effect on increase in weight.

PROBLEMS 27.3

1. Find the student's t for the following variable values in a sample of eight : -4, -2, -2, 0, 2, 2, 3, 3 ; taking the mean of the universe to be zero.

2. A random sample of 10 boys had the following I.Q. :

70, 120, 110, 101, 88, 83, 95, 98, 107, 100.

Do these data support the assumption of a population mean I.Q. of 100 (at 5% level of significance) ?

(V.T.U., 2006 ; Coimbatore, 2001)

3. A sample of 10 measurements of the diameter of a sphere gave a mean of 12 cm and a standard deviation 0.15 cm. Find 95% confidence limits for the actual diameter.

4. A random sample of size 25 from a normal population has the mean $\bar{x} = 47.5$ and s.d. $S = 8.4$. Does this information refute the claim that the mean of the population is $\mu = 42.1$. (J.N.T.U., 2003)

5. A process for making certain bearings is under control if the diameter of the bearings have the mean 0.5 cm. What can we say about this process if a sample of 10 of these bearings has a mean diameter of 0.506 cm. and s.d. of 0.004 cm ?

6. A machine is supposed to produce washers of mean thickness 0.12 cm. A sample of 10 washers was found to have a mean thickness of 0.128 cm and standard deviation 0.008. Test whether the machine is working in proper order at 5% level of significance.

7. Find out the reliability of the sample mean of the following data : *Breaking strength of 10 specimens of 1.04 cms diameter hard-drawn copper wire :*

Specimen	1	2	3	4	5	6	7	8	9	10
Breaking Strength (kgs) :	578	572	570	568	572	570	570	572	526	584

8. Test runs with 6 models of an experiment... engine showed that they operated for 24, 28, 21, 23, 32 and 22 minutes with a gallon of fuel. If the probability of a Type I error is at the most 0.01, is this evidence against a hypothesis that on the average this kind of engine will operate for atleast 29 minutes per gallon of the same fuel. Assume normality. (J.N.T.U., 2003)

9. Two horses *A* and *B* were tested according to the time (in seconds) to run a particular race with the following results :

Horse <i>A</i> :	28	30	32	33	33	29	and 34
Horse <i>B</i> :	29	30	30	24	27	and 29	

Test whether you can discriminate between two horses ?

(Rohilk, 2005 ; Coimbatore, 2001)

10. A group of 10 rats fed on a diet *A* and another group of 8 rats fed on a different diet *B*, recorded the following increase in weights :

Diet <i>A</i> :	5	6	8	1	12	4	3	9	6	10	gm
Diet <i>B</i> :	2	3	6	8	10	1	2	8			gm.

Does it show that superiority of diet *A* over that of *B* ?

(Madras, 2003)

11. A group of boys and girls were given an intelligence test. The mean score, S.D.s and numbers in each group are as follows :

	Boys	Girls
Mean	124	121
S.D.	12	10
<i>n</i>	18	14

Is the mean score of boys significantly different from that of girls ?

12. The means of two random samples of sizes 9 and 7 are 196.42 and 198.82 respectively. The sum of the squares of the deviations from the mean are 26.94 and 18.73 respectively. Can the sample be considered to have been drawn from the same normal population ?

(Mumbai, 2004)

27.17 (1) CHI-SQUARE (χ^2) TEST

When a fair coin is tossed 80 times, we expect from theoretical considerations that heads will appear 40 times and tail 40 times. But this never happens in practice i.e., the results obtained in an experiment do not agree exactly with the theoretical results. The magnitude of discrepancy between observation and theory is given by the quantity χ^2 (pronounced as chi-square). If $\chi^2 = 0$, the observed and theoretical frequencies completely agree. As the value of χ^2 increases, the discrepancy between the observed and theoretical frequencies increases.

(1) Definition. If O_1, O_2, \dots, O_n be a set of observed (experimental) frequencies and E_1, E_2, \dots, E_n be the corresponding set of expected (theoretical) frequencies, then χ^2 is defined by the relation

$$\begin{aligned}\chi^2 &= \frac{(O_1 - E_1)^2}{E_1} + \frac{(O_2 - E_2)^2}{E_2} + \dots + \frac{(O_n - E_n)^2}{E_n} \\ &= \sum \frac{(O_i - E_i)^2}{E_i}\end{aligned}\quad \dots(1)$$

with $n - 1$ degrees of freedom.

$[\Sigma O_i = \Sigma E_i = n$ the total frequency]

(2) Chi-square distribution*

If x_1, x_2, \dots, x_n be n independent normal variates with mean zero and s.d. unity, then it can be shown that $x_1^2 + x_2^2 + \dots + x_n^2$, is a random variate having χ^2 -distribution with *ndf*.

The equation of the χ^2 -curve is

$$y = y_0 e^{-x^{2/2}} (\chi^2)^{(v-1)/2} \quad \dots(2)$$

where $v = n - 1$ (Fig. 27.3).

(3) Properties of χ^2 -distribution

I. If $v = 1$, the χ^2 -curve (2) reduces to $y = y_0 e^{-x^{2/2}}$, which is the exponential distribution.

II. If $v > 1$, this curve is tangential to x -axis at the origin and is positively skewed as the mean is at v and mode at $v - 2$.

III. The probability P that the value of χ^2 from a random sample will exceed χ_0^2 is given by

$$P = \int_{\chi_0^2}^{\infty} y dx.$$

The values of χ_0^2 have been tabulated for various values of P and for values of v from 1 to 30. (Table-V-Appendix 2)

For $v > 30$, the χ^2 -curve approximates to the normal curve and we should refer to normal distribution tables for significant values of χ^2 .

IV. Since the equation of χ^2 -curve does not involve any parameters of the population, this distribution does not depend on the form of the population and is therefore, very useful in a large number of problems.

V. Mean = γ and variance = 2γ .

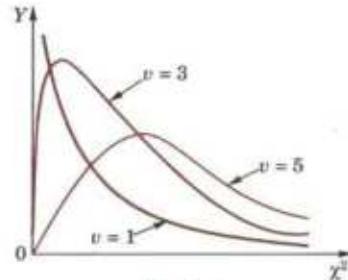

Fig. 27.3

27.18 GOODNESS OF FIT

The value of χ^2 is used to test whether the deviations of the observed frequencies from the expected frequencies are significant or not. It is also used to test how well a set of observations fit a given distribution. χ^2 therefore, provides a test of goodness of fit and may be used to examine the validity of some hypothesis about an observed frequency distribution. As a test of goodness of fit, it can be used to study the correspondence between theory and fact.

This is a non-parametric distribution-free test since in this we make no assumption about the distribution of the parent population.

*Hamlet discovered this distribution in 1875. Karl Pearson rediscovered it independently in 1900 and applied it to test 'goodness of fit'.

Procedure to test significance and goodness of fit.

(i) Set up a 'null hypothesis' and calculate

$$\chi^2 = \sum \frac{(O_i - E_i)^2}{E_i}$$

(ii) Find the df and read the corresponding values of χ^2 at a prescribed significance level from Table V.

(iii) From χ^2 -table, we can also find the probability P corresponding to the calculated values of χ^2 for the given $d.f.$

(iv) If $P < 0.05$, the observed value of χ^2 is significant at 5% level of significance.

If $P < 0.01$, the value is significant at 1% level.

If $P > 0.05$, it is a good fit and the value is not significant.

Example 27.17. In experiments on pea breeding, the following frequencies of seeds were obtained :

Round and yellow	Wrinkled and yellow	Round and green	Wrinkled and green	Total
315	101	108	32	556

Theory predicts that the frequencies should be in proportions 9 : 3 : 3 : 1. Examine the correspondence between theory and experiment.

Solution. The corresponding frequencies are

$$\frac{9}{16} \times 556, \frac{3}{16} \times 556, \frac{3}{16} \times 556, \frac{1}{16} \times 556 \text{ i.e., } 313, 104, 104, 35.$$

$$\begin{aligned} \text{Hence } \chi^2 &= \frac{(315 - 313)^2}{313} + \frac{(101 - 104)^2}{104} + \frac{(108 - 104)^2}{104} + \frac{(32 - 35)^2}{35} \\ &= \frac{4}{313} + \frac{9}{104} + \frac{16}{104} + \frac{9}{35} = 0.51 \quad \text{and } df v = 4 - 1 = 3. \end{aligned}$$

For $v = 3$, we have $\chi_{0.05}^2 = 7.815$

[From Table V]

Since the calculated value of χ^2 is much less than $\chi_{0.05}^2$, there is a very high degree of agreement between theory and experiment.

Example 27.18. A set of five similar coins is tossed 320 times and the result is

No. of heads :	0	1	2	3	4	5
Frequency :	6	27	72	112	71	32

Test the hypothesis that the data follow a binomial distribution.

(Kottayam, 2005 ; P.T.U., 2005 ; V.T.U., 2004)

Solution. For $v = 5$, we have $\chi_{0.05}^2 = 11.07$.

p , probability of getting a head = $\frac{1}{2}$; q , probability of getting a tail = $\frac{1}{2}$.

Hence the theoretical frequencies of getting 0, 1, 2, 3, 4, 5 heads are the successive terms of the binomial expansion $320(p+q)^5$

$$\begin{aligned} &= 320[p^5 + 5p^4q + 10p^3q^2 + 10p^2q^3 + 5pq^4 + q^5] \\ &= 320\left[\frac{1}{32} + \frac{5}{32} + \frac{10}{32} + \frac{10}{32} + \frac{5}{32} + \frac{1}{32}\right] = 10 + 50 + 100 + 100 + 50 + 10 \end{aligned}$$

Thus the theoretical frequencies are 10, 50, 100, 100, 50, 10.

Hence

$$\begin{aligned} \chi^2 &= \frac{(6 - 10)^2}{10} + \frac{(27 - 50)^2}{50} + \frac{(72 - 100)^2}{100} + \frac{(112 - 100)^2}{100} + \frac{(71 - 50)^2}{50} + \frac{(32 - 10)^2}{10} \\ &= \frac{1}{10}(160 + 1058 + 784 + 144 + 882 + 4840) = \frac{7868}{100} = 78.68 \end{aligned}$$

and

$$df v = 6 - 1 = 5.$$

Since the calculated value of χ^2 is much greater than $\chi_{0.05}^2$, the hypothesis that the data follow the binomial law is rejected.

Example 27.19. Fit a Poisson distribution to the following data and test for its goodness of fit at level of significance 0.05.

$x:$	0	1	2	3	4
$f:$	419	352	154	56	19

(V.T.U., 2008)

$$\text{Solution. Mean } m = \frac{\sum fx_i}{\sum f_i} = \frac{904}{1000} = 0.904. \quad \therefore e^{-m} = e^{-0.904} = 0.4049.$$

Hence the theoretical frequencies are $\frac{1000 \times e^{-m} (m)^r}{r!}, r = 0, 1, 2, 3, 4$

i.e.,	$x:$	0	1	2	3	4	Total
$f:$	404.9	366	165.4	49.8	11.3	(12.6)	997.4

In order that the total observed and expected frequencies may agree, we take the first and last theoretical frequencies as 406.2 and 12.6 instead of 404.9 and 11.3 as shown in brackets. (In case, the expected frequencies are less than 10, we group together such classes. Here of course, none of the frequencies < 10).

Hence

$$\begin{aligned}\chi^2 &= \frac{(419 - 406.2)^2}{406.2} + \frac{(352 - 366)^2}{366} + \frac{(154 - 165.4)^2}{165.4} + \frac{(56 - 49.8)^2}{49.8} + \frac{(19 - 12.6)^2}{12.6} \\ &= 0.403 + 0.536 + 0.786 + 0.772 + 3.251 = 5.748\end{aligned}$$

Since the mean of the theoretical distribution has been estimated from the given data and the totals have been made to agree, there are two constraints so that the number of degrees of freedom $v = 5 - 2 = 3$.

For $v = 3$, we have $\chi_{0.05}^2 = 7.82$.

[From Table V]

Since the calculated value of $\chi^2 < \chi_{0.05}^2$, the agreement between the fact and theory is good and hence the Poisson distribution can be fitted to the data.

Example 27.20. Fit a normal distribution to the following data of weights of 100 students of Delhi University and test the goodness of fit.

Weights (kg) :	60-62	63-65	66-68	69-71	72-74
Frequency :	5	18	42	27	8

Solution. Here $N = 100$, mean $m = 67.45$ and S.D. $\sigma = 2.92$. The calculations are arranged as follows^{*}:

Class boundary (x)	$z = (x - m)/\sigma$	Area under normal curve from 0 to z	Area for each class (A) [*]	Expected frequency ($f_e = N \times A$)
59.5	-2.72	0.4967	0.0413	4.13
62.5	-1.70	0.4554	0.2068	20.68
65.5	-0.67	0.2486	0.3892	38.92
68.5	0.36	0.1406	0.2771	27.71
71.5	1.39	0.4177	0.0743	7.43
74.5	2.41	0.4920		

* A is obtained by subtracting the successive areas in the third column when the corresponding values of z have the same sign and adding them when the z values have opposite signs (which occurs only once).

$$\chi^2 = \frac{(5 - 4.13)^2}{4.13} + \frac{(18 - 20.68)^2}{20.68} + \frac{(42 - 38.92)^2}{38.92} + \frac{(27 - 27.71)^2}{27.71} + \frac{(8 - 7.43)^2}{7.43}$$

$$= 0.1833 + 0.3473 + 0.2437 + 0.0182 + 0.0437 = 0.8362$$

As regards the number of degrees of freedom (γ), there are three constraints (i) discrepancy between total observed and total estimated frequencies (ii) and (iii) mean (m) and standard deviation (σ) have been estimated from the sample data. $\therefore r = 5 - 3 = 2$.

For $\gamma = 2$, $\chi^2_{0.05} = 0.103$ from table V.

Since $\chi^2 = 0.8362 > 0.103$. Hence the fit is not good.

PROBLEMS 27.4

1. Five dice were thrown 96 times and the number of times 4, 5 or 6 were thrown were :

No. of dice showing 4, 5 or 6 :	5	4	3	2	1	0
Frequency :	8	18	35	24	10	1

Find the probability of getting this result by chance ?

2. Genetic theory states that children having one parent of blood type M and other blood type N will always be one of the three types M, MN, N and that the proportions of these types will on average be 1 : 2 : 1. A report states that out of 300 children having one M parent and one N parent, 30% were found to be of type M , 45% of type MN and remainder of type N . Test the hypothesis by χ^2 test.

3. A die was thrown 60 times and the following frequency distribution was observed :

Faces :	1	2	3	4	5	6
f_0 :	15	6	4	7	11	17

Test whether the die is unbiased ?

4. The following table gives the number of aircraft accidents that occurred during the various days of the week. Find whether the accidents are uniformly distributed over the week ?

Days	Sun	Mon	Tue	Wed	Thu	Fri	Sat	Total
No. of accidents	14	16	8	12	11	9	14	84

(Hissar, 2005)

5. Fit a binomial distribution to the data :

x :	0	1	2	3	4	5
f :	38	144	342	287	164	25

and test for goodness of fit, at the level of significance 0.05.

6. In 1000 extensive sets of trials for an event of small probability, the frequencies f_0 of the number x of successes proved to be :

x :	0	1	2	3	4	5	6	7
f_0 :	305	366	210	80	28	9	2	1

Fit a Poisson distribution to the data and test the goodness of fit.

7. The frequencies of localities according to the number of deaths due to cholera during eight years in 1000 localities is as follows :

No. of deaths	0	1	2	3	4	5	6	7
No. of localities	314	355	204	86	29	9	3	0

Fit a suitable distribution to the data and test the goodness of fit.

8. Obtain the equation of the normal curve that may be fitted to the data and test the goodness of fit.

x :	4	6	8	10	12	14	16	18	20	22	24	Total
$f(x)$:	1	7	15	22	35	43	38	20	13	5	1	200

27.19 (1) F-DISTRIBUTION*

Let x_1, x_2, \dots, x_{n_1} and y_1, y_2, \dots, y_{n_2} be the values of two independent random samples drawn from the normal populations σ^2 having equal variances.

* This distribution was introduced by the English statistician Prof. R.A. Fisher (1890–1962) who had greatly influenced the development of modern statistics.

Let \bar{x}_1 and \bar{x}_2 be the sample means and $s_1^2 = \frac{1}{n_1 - 1} \sum_{i=1}^{n_1} (x_i - \bar{x})^2$, $s_2^2 = \frac{1}{n_2 - 1} \sum_{i=1}^{n_2} (y_i - \bar{y})^2$ be the sample variances.

Then we define F by the relation

$$F = \frac{s_1^2}{s_2^2} \quad (s_1^2 > s_2^2)$$

This gives F -distribution (also known as variance ratio distribution) with $\gamma_1 = n_1 - 1$ and $\gamma_2 = n_2 - 1$ degrees of freedom. The larger of the variances is placed in the numerator.

(2) Properties. I. The F -distribution curve lies entirely in the first quadrant and is *unimodal*.

II. The F -distribution is independent of the population variance σ^2 and depends on γ_1 and γ_2 only.

III. $F_\alpha(\gamma_1, \gamma_2)$ is the value of F for γ_1 and γ_2 of such that the area to the right of F_α is α .

IV. It can be shown that the mode of F -distribution is less than unity.

(3) Significance test. Snedecor's F -tables give 5% and 1% points of significance for F . (Table VI – Appendix 2). 5% points of F mean that area under the F -curve to the right of the ordinate at a value of F , is 0.05. Clearly value of F at 5% significance is lower than that at 1%. F -distribution is very useful for testing the equality of population means by comparing sample variances. As such it forms the basis of *analysis of variance*.

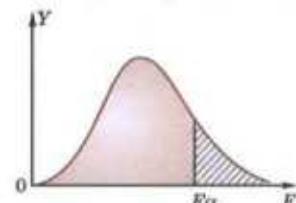

Fig. 27.4

Example 27.21. Two samples of sizes 9 and 8 give the sum of squares of deviations from their respective means equal to 160 inches² and 91 inches² respectively. Can these be regarded as drawn from the same normal population? (V.T.U., 2002)

Solution. We have $\Sigma(x - \bar{x})^2 = 160$ and $\Sigma(y - \bar{y})^2 = 91$

$$\therefore s_1^2 = \frac{160}{8} = 20$$

and

$$s_2^2 = \frac{91}{7} = 13.$$

$$\text{Hence } F = \frac{s_1^2}{s_2^2} = \frac{20}{13} = 1.54 \text{ nearly.}$$

For $\gamma_1 = 8$, $\gamma_2 = 7$, we have $F_{0.05} = 3.73$.

[From Table VI]

Since the calculated value of $F < F_{0.05}$, the population variances are not significantly different. Thus the two samples can be regarded as drawn from two normal populations with the same variance. If the two populations are to be same, their means should also be the same which can be verified by applying t -test provided the sample means are known.

Example 27.22. Measurements on the length of a copper wire were taken in 2 experiments A and B as under :

A's measurements (mm) : 12.29, 12.25, 11.86, 12.13, 12.44, 12.78, 12.77, 11.90, 12.47.

B's measurements (mm) : 12.39, 12.46, 12.34, 12.22, 11.98, 12.46, 12.23, 12.06.

Test whether B's measurements are more accurate than A's. (The readings taken in both cases being unbiased)

Solution. Readings in both cases being unbiased, B's measurements will be taken more accurate if its population variance is less than that of A's measurements.

Under the hypothesis that the two populations have the same variance (i.e. $\sigma_1^2 = \sigma_2^2$), we have

$$F = \frac{s_1^2}{s_2^2}$$

with $\gamma_1 = n_1 - 1 = 8$ and $\gamma_2 = n_2 - 1 = 7$.

We calculate the s.d.'s of the two series as follows :

A's measurements			B's measurements		
x	$u = 100(x - 12)$	u^2	y	$v = 100(y - 12)$	v^2
12.20	29	841	12.39	39	1521
12.25	25	625	12.46	46	2116
11.86	-14	196	12.34	34	1156
12.13	13	169	12.22	22	484
12.44	44	1936	11.98	-2	4
12.78	78	6084	12.46	46	2116
12.77	77	5929	12.23	23	529
11.90	-10	100	12.06	6	36
12.47	47	2209			
	289	18089		214	7962

$$\therefore s_1^2 = \frac{1}{n_1 - 1} \left[18089 - \frac{(289)^2}{n_1} \right] = \frac{1}{8} (18089 - 9280) = 1101.1$$

$$s_2^2 = \frac{1}{n_2 - 1} \left[7962 - \frac{(214)^2}{n_2} \right] = \frac{1}{7} (7962 - 5724) = 319.7$$

$$\therefore F = \frac{s_1^2}{s_2^2} = \frac{1101.1}{319.7} = 3.44$$

For $\gamma_1 = 8$ and $\gamma_2 = 7$, from table VI, $F_{0.05} = 3.73$ and $F_{0.01} = 6.84$.

Since the calculated value of F is less than both $F_{0.05}$ and $F_{0.01}$, the result is insignificant at both 5% and 1% level.

Hence there is no reason to say that B 's measurements are more accurate than those of A 's.

27.20 (1) FISHER'S z-DISTRIBUTION

Changing the variable F to z by the substitution $z = \frac{1}{2} \log_e F$ or $F = e^{2z}$ in the F -distribution, we get the Fisher's z -distribution.

It is more nearly symmetrical than F -distribution. Table showing the values of z that will be exceeded in simple sampling with probabilities 0.05 and 0.01 have been prepared for various values of v_1 and v_2 .

(2) Significance test. As z -table give only critical values corresponding to right hand tail areas, therefore 5% (or 1%) points of z imply that the area to the right of the ordinate at z is 0.05 (or 0.01). In other words, 5% and 1% points of z correspond to 10% and 2% levels of significance respectively.

Example 27.23. Two gauge operations are tested for precision in making measurements. One operator completes a set of 26 readings with a standard deviations of 1.34 and the other does 34 readings with a standard deviations of 0.98. What is the level of significance of this difference?

(Given that for $v_1 = 25$ and $v_2 = 33$, $z_{0.05} = 0.305$, $z_{0.01} = 0.432$)

Solution. We have $n_1 = 26$, $\sigma_x = 1.34$; $n_2 = 34$, $\sigma_y = 0.98$

$$\therefore s_1^2 = \frac{n_1}{n_1 - 1} \cdot \sigma_x^2 = \frac{26}{25} (1.34)^2 = (1.34)^2 \quad \text{and} \quad s_2^2 = \frac{n_2}{n_2 - 1} \cdot \sigma_y^2 = \frac{34}{33} (0.98)^2 = (0.98)^2$$

$$\text{Hence } F = \left(\frac{1.34}{0.98} \right)^2 = 1.8696 \quad \text{and} \quad z = \frac{1}{2} \log_e F = 1.1513 \log_{10} 1.8696 = 0.3129$$

Since the calculated value of z is just greater than $z_{0.05}$ and less than $z_{0.01}$, the difference between the standard deviation is just significant at 5% level and insignificant at 1% level.

PROBLEMS 27.5

- Two samples of 9 and 7 individuals have variances 4.8 and 9.6 respectively. Is the variance 9.6 significantly greater than the variance 4.6?
- Test for breaking strength were carried out on two lots of 5 and 9 steel wires. The variance of one lot was 230 and that of other was 492. Is there a significant difference in their variability?
- Show how you would use Fisher's z-test to decide whether the two sets of observations 17, 27, 18, 25, 27, 29, 27, 23, 17 and 16, 16, 20, 16, 20, 17, 15, 21, indicate samples from the same universe.
- In two groups of ten children each, the increase in weight due to different diets during the same period, were in pounds:

$$\begin{array}{ccccccc} 3, 7, 5, 6, 5, 4, 4, 5, 3, 6 \\ 8, 5, 7, 8, 3, 2, 7, 6, 5, 7 \end{array}$$

Is there a significant difference in their variability?

- The mean diameter of rivets produced by two firms A and B are practically the same but their standard deviations are different. For 16 rivets manufactured by firm A, the S.D. is 3.8 mm while for 22 rivets manufactured by firm B is 2.9 mm. Do you think products of firm B are of better quality than those of firm A?
- The I.Q.'s of 25 students from one college showed a variance of 16 and those of an equal number from the other college had a variance of 8. Discuss whether there is any significant difference in variability of intelligence.
- Two random samples from two normal populations are given below :

Sample I	:	16	26	27	23	24	22
Sample II	:	33	42	35	32	28	31

Do the estimates of population variances differ significantly?

Degrees of freedom	:	(5, 5)	(5, 6)	(6, 5)
5% value of F	:	5.05	4.39	4.95

- Two independent samples of sizes 7 and 6 have the following values :

Sample A :	28	30	32	33	33	29	34
Sample B :	29	30	30	24	27	29	

Examine whether the samples have been drawn from normal populations having the same variance?

[Given that the values of F at 5% level for (6, 5) d.f. is 4.95 and for (5, 6) d.f. is 4.39].

27.21 OBJECTIVE TYPE OF QUESTIONS**PROBLEMS 27.6**

Select the correct answer or fill up the blanks in each of the following questions :

- The 'null hypothesis' implies that 2. The uses of t-distribution are
- Type I and type II errors are such that 4. A single-tailed test is used when
- Control limit theorem states that 6. A hypothesis is true, but is rejected. Then this is an error of type
- A hypothesis is true, but is rejected. Then this is an error of type
- If the standard deviation of a χ^2 distribution is 10, then its degree of freedom is
- Range of F-distribution is
- A hypothesis is false but accepted, then there is an error of type
- The mean and variance of a χ^2 distribution with 8 degrees of freedom are and respectively.
- In a t-distribution of sample size n , the degrees of freedom are
- The test statistic $F = \frac{s_1^2}{s_2^2}$ is used when

(i) $s_1^2 > s_2^2$	(ii) $s_1^2 < s_2^2$	(iii) $s_1^2 = s_2^2$	(iv) none of these.
---------------------	----------------------	-----------------------	---------------------
- The t-test is applicable to samples for which n is
- The two main uses of χ^2 -test are
- Range of t-distribution is
- If two samples are taken from two populations of unequal variances, we can apply t-test to test the difference of means. (True or False)
- The Chi-square distribution is continuous. (True or False)

28.1 INTRODUCTION

The limitations of analytical methods have led the engineers and scientists to evolve graphical and numerical methods. As seen in § 1.8, the graphical methods, though simple, give results to a low degree of accuracy. Numerical methods can, however, be derived which are more accurate. With the advent of high speed digital computers and increasing demand for numerical answers to various problems, numerical techniques have become indispensable tool in the hands of engineers.

Numerical methods are often, of a repetitive nature. These consist in repeated execution of the same process where at each step the result of the preceding step is used. This is known as *iteration process* and is repeated till the result is obtained to a desired degree of accuracy.

In this chapter, we shall discuss some numerical methods for the solution of algebraic and transcendental equations and simultaneous linear and non-linear equations. We shall close the chapter by describing an iterative method for the solution of eigen-value problem. For a detailed study of these topics, the reader should refer to author's book '*Numerical Methods in Engineering & Science*'.

28.2 SOLUTION OF ALGEBRAIC AND TRANSCENDENTAL EQUATIONS

To find the roots of an equation $f(x) = 0$, we start with a known approximate solution and apply any of the following methods :

(1) **Bisection method.** This method consists in locating the root of the equation $f(x) = 0$ between a and b . If $f(x)$ is continuous between a and b , and $f(a)$ and $f(b)$ are of opposite signs then there is a root between a and b . For definiteness, let $f(a)$ be negative and $f(b)$

be positive. Then the first approximation to the root is $x_1 = \frac{1}{2}(a + b)$.

If $f(x_1) = 0$, then x_1 is a root of $f(x) = 0$. Otherwise, the root lies between a and x_1 or x_1 and b according as $f(x_1)$ is positive or negative. Then we bisect the interval as before and continue the process until the root is found to desired accuracy.

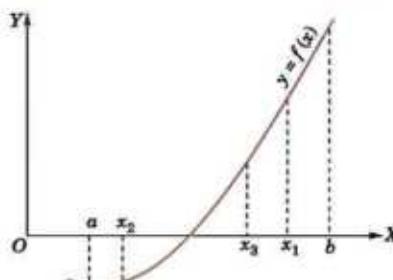

Fig. 28.1

In the Fig. 28.1, $f(x_1)$ is +ve, so that the root lies between a and x_1 . Then the second approximation to the root is $x_2 = \frac{1}{2}(a + x_1)$. If $f(x_2)$ is -ve, the root lies between x_1 and x_2 . Then the third approximation to the root is $x_3 = \frac{1}{2}(x_1 + x_2)$ and so on.

Example 28.1. (a) Find a root of the equation $x^3 - 4x - 9 = 0$, using the bisection method, correct to three decimal places. (Mumbai, 2003)

(b) Using bisection method, find the negative root of the equation $x^3 - 4x + 9 = 0$. (J.N.T.U., 2009)

Solution. (a) Let $f(x) = x^3 - 4x - 9$

Since $f(2)$ is -ve and $f(3)$ is +ve, a root lies between 2 and 3

∴ first approximate to the root is

$$x_1 = \frac{1}{2}(2 + 3) = 2.5$$

Thus $f(x_1) = (2.5)^3 - 4(2.5) - 9 = -3.375$ i.e., -ve

∴ the root lies between x_1 and 3. Thus the second approximation to the root is

$$x_2 = \frac{1}{2}(x_1 + 3) = 2.75$$

Then $f(x_2) = (2.75)^3 - 4(2.75) - 9 = 0.7969$ i.e., +ve

∴ the root lies between x_1 and x_2 . Thus the third approximation to the root is

$$x_3 = \frac{1}{2}(x_1 + x_2) = 2.625$$

Then $f(x_3) = (2.625)^3 - 4(2.625) - 9 = -1.4121$ i.e., -ve

∴ the root lies between x_2 and x_3 . Thus the fourth approximation to the root is

$$x_4 = \frac{1}{2}(x_2 + x_3) = 2.6875$$

Repeating this process, the successive approximations are

$$x_5 = 2.71875,$$

$$x_6 = 2.70313,$$

$$x_7 = 2.71094$$

$$x_8 = 2.70703,$$

$$x_9 = 2.70508,$$

$$x_{10} = 2.70605$$

$$x_{11} = 2.70654,$$

$$x_{12} = 2.70642$$

Hence the root is 2.7064

(b) If α, β, γ are the roots of the given equation, then $-\alpha, -\beta, -\gamma$ are the roots of $(-x)^3 - 4(-x) + 9 = 0$
∴ the negative root of the given equation is the positive root of $x^3 - 4x - 9 = 0$ which we have found above to be 2.7064.

Hence the negative root for the given equation is - 2.7064.

Example 28.2. By using the bisection method, find an approximate root of the equation $\sin x = 1/x$, that lies between $x = 1$ and $x = 1.5$ (measured in radians). Carry out computations upto the 7th stage.

(V.T.U., 2003 S)

Solution. Let $f(x) = x \sin x - 1$. We know that $1^\circ = 57.3^\circ$.

Since $f(1) = 1 \times \sin(1) - 1 = \sin(57.3^\circ) - 1 = -0.15849$

and $f(1.5) = 1.5 \times \sin(1.5^\circ) - 1 = 1.5 \times \sin(85.95^\circ) - 1 = 0.49625$;

a root lies between 1 and 1.5.

∴ first approximation to the root is $x_1 = \frac{1}{2}(1 + 1.5) = 1.25$.

Then $f(x_1) = (1.25) \sin(1.25) - 1 = 1.25 \sin(71.625^\circ) - 1 = 0.18627$ and $f(1) < 0$.

∴ a root lies between 1 and $x_1 = 1.25$.

Thus the second approximation to the root is $x_2 = \frac{1}{2}(1 + 1.25) = 1.125$.

Then $f(x_2) = 1.125 \sin(1.125) - 1 = 1.125 \sin(64.46^\circ) - 1 = 0.01509$ and $f(1) < 0$.

∴ a root lies between 1 and $x_2 = 1.125$.

Thus the third approximation to the root is $x_3 = \frac{1}{2}(1 + 1.125) = 1.0625$

Then $f(x_3) = 1.0625 \sin(1.0625) - 1 = 1.0625 \sin(60.88) - 1 = -0.0718 < 0$
 and $f(x_2) > 0$, i.e. now the root lies between $x_3 = 1.0625$ and $x_2 = 1.125$.

\therefore fourth approximation to the root is $x_4 = \frac{1}{2}(1.0625 + 1.125) = 1.09375$

Then $f(x_4) = -0.02836 < 0$ and $f(x_2) > 0$,
 i.e., the root lies between $x_4 = 1.09375$ and $x_2 = 1.125$.

\therefore fifth approximation to the root is $x_5 = \frac{1}{2}(1.09375 + 1.125) = 1.10937$

Then $f(x_5) = -0.00664 < 0$ and $f(x_2) > 0$.

\therefore the root lies between $x_5 = 1.10937$ and $x_2 = 1.125$.

Thus the sixth approximation to the root is

$$x_6 = \frac{1}{2}(1.10937 + 1.125) = 1.11719$$

Then $f(x_6) = 0.00421 > 0$. But $f(x_5) < 0$.

\therefore the root lies between $x_5 = 1.10937$ and $x_6 = 1.11719$.

Thus the seventh approximation to the root is $x_7 = \frac{1}{2}(1.10937 + 1.11719) = 1.11328$

Hence the desired approximation to the root is 1.11328.

(2) Method of false position or Regula-falsi

method. This is the oldest method of finding the real root of an equation $f(x) = 0$ and closely resembles the bisection method. Here we choose two points x_0 and x_1 such that $f(x_0)$ and $f(x_1)$ are of opposite signs i.e., the graph of $y = f(x)$ crosses the x -axis between these points (Fig. 28.2). This indicates that a root lies between x_0 and x_1 consequently $f(x_0)f(x_1) < 0$.

Equation of the chord joining the points $A[x_0, f(x_0)]$ and $B[x_1, f(x_1)]$ is

$$y - f(x_0) = \frac{f(x_1) - f(x_0)}{x_1 - x_0} (x - x_0) \quad \dots(1)$$

The method consists in replacing the curve AB by means of the chord AB and taking the point of intersection of the chord with the x -axis as an approximation to the root. So the abscissa of the point where the chord cuts the x -axis ($y = 0$) is given by

$$x_2 = x_0 - \frac{x_1 - x_0}{f(x_1) - f(x_0)} f(x_0) \quad \dots(2)$$

which is an approximation to the root.

If now $f(x_0)$ and $f(x_2)$ are of opposite signs, then the root lies between x_0 and x_2 . So replacing x_1 by x_2 in (2), we obtain the next approximation x_3 . (The root could as well lie between x_1 and x_2 and we would obtain x_3 accordingly). This procedure is repeated till the root is found to desired accuracy. The iteration process based on (1) is known as the *method of false position*.

Example 28.3. Find a real root of the equation $x^3 - 2x - 5 = 0$ by the method of false position correct to three decimal places. (Manipal, 2005)

Solution. Let $f(x) = x^3 - 2x - 5$

so that $f(2) = -1$ and $f(3) = 16$ i.e., A root lies between 2 and 3.

\therefore taking $x_0 = 2$, $x_1 = 3$, $f(x_0) = -1$, $f(x_1) = 16$, in the method of false position, we get

$$x_2 = x_0 - \frac{x_1 - x_0}{f(x_1) - f(x_0)} f(x_0) = 2 + \frac{1}{17} = 2.0588 \quad \dots(i)$$

Now $f(x_2) = f(2.0588) = -0.3908$ i.e., the root lies between 2.0588 and 3.

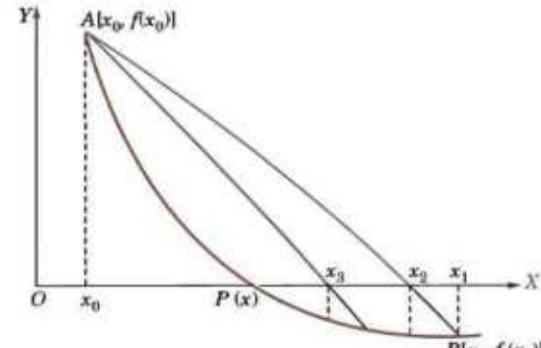

Fig. 28.2

\therefore taking $x_0 = 2.0588, x_1 = 3, f(x_0) = -0.3908, f(x_1) = 16$, in (i), we get

$$x_2 = x_0 - \frac{0.9412}{16.3908} (-0.3908) = 2.0813$$

Repeating this process, the successive approximations are

$$x_4 = 2.0862, x_5 = 2.0915, x_6 = 2.0934, x_7 = 2.0941, x_8 = 2.0943 \text{ etc.}$$

Hence the root is 2.094 correct to 3 decimal places.

Example 28.4. Find the root of the equation $\cos x = xe^x$ using the regula-falsi method correct to four decimal places. (Bhopal, 2009)

Solution. Let $f(x) = \cos x - xe^x = 0$

$$\text{So that } f(0) = 1, f(1) = \cos 1 - e = -2.17798$$

i.e., the root lies between 0 and 1.

\therefore taking $x_0 = 0, x_1 = 1, f(x_0) = 1$ and $f(x_1) = -2.17798$ in the regula-falsi method, we get

$$x_2 = x_0 - \frac{x_1 - x_0}{f(x_1) - f(x_0)} f(x_0) = 0 + \frac{1}{3.17798} \times 1 = 0.31467 \quad \dots(i)$$

$$\text{Now } f(0.31467) = 0.51987$$

i.e., the root lies between 0.31467 and 1.

\therefore taking $x_0 = 0.31467, x_1 = 1, f(x_0) = 0.51987, f(x_1) = -2.17798$ in (i), we get

$$x_3 = 0.31467 + \frac{0.68533}{2.69785} \times 0.51987 = 0.44673$$

$$\text{Now } f(0.44673) = 0.20356$$

i.e., the root lies between 0.44673 and 1.

\therefore taking $x_0 = 0.44673, x_1 = 1, f(x_0) = 0.20356, f(x_1) = -2.17798$ in (i), we get

$$x_4 = 0.44673 + \frac{0.55327}{2.38154} \times 0.20356 = 0.49402$$

Repeating this process, the successive approximations are

$$x_5 = 0.50995, \quad x_6 = 0.51520, \quad x_7 = 0.51692$$

$$x_8 = 0.51748, \quad x_9 = 0.51767, \quad x_{10} = 0.51775 \text{ etc.}$$

Hence the root is 0.5177 correct to 4 decimal places.

Example 28.5. Find a real root of the equation $x \log_{10} x = 1.2$ by regula-falsi method correct to four decimal places. (V.T.U., 2010; J.N.T.U., 2008; Kottayam, 2005)

Solution. Let $f(x) = x \log_{10} x - 1.2$

so that $f(1) = -\text{ve}, f(2) = -\text{ve}$ and $f(3) = +\text{ve}$.

\therefore a root lies between 2 and 3.

Taking $x_0 = 2$ and $x_1 = 3, f(x_0) = -0.59794$ and $f(x_1) = 0.23136$, in the method of false position, we get

$$x_2 = x_0 - \frac{x_1 - x_0}{f(x_1) - f(x_0)} f(x_0) = 2.72102 \quad \dots(i)$$

$$\text{Now } f(x_2) = f(2.72102) = -0.01709$$

i.e., the root lies between 2.72102 and 3.

\therefore taking $x_0 = 2.72102, x_1 = 3, f(x_0) = -0.01709$

and $f(x_1) = 0.23136$ in (i), we get

$$x_3 = 2.72102 + \frac{0.27898}{0.23136 + 0.01709} \times 0.01709 = 2.74021$$

Repeating this process, the successive approximations are

$$x_4 = 2.74024, x_5 = 2.74063 \text{ etc.}$$

Hence the root is 2.7406 correct to 4 decimal places.

Example 28.6. Use the method of false position, to find the fourth root of 32 correct to three decimal places.

Solution. Let $x = (32)^{1/4}$ so that $x^4 - 32 = 0$

Take $f(x) = x^4 - 32$. Then $f(2) = -16$ and $f(3) = 49$, i.e., a root lies between 2 and 3.

∴ taking $x_0 = 2, x_1 = 3, f(x_0) = -16, f(x_1) = 49$ in the method of false position, we get

$$x_2 = x_0 - \frac{x_1 - x_0}{f(x_1) - f(x_0)} f(x_0) = 2 + \frac{16}{65} = 2.2462 \quad \dots(i)$$

Now $f(x_2) = f(2.2462) = -6.5438$ i.e. the root lies between 2.2462 and 3.

∴ taking $x_0 = 2.2462, x_1 = 3, f(x_0) = -6.5438, f(x_1) = 49$

in (i), we get $x_3 = 2.2462 - \frac{3 - 2.2462}{49 + 6.5438} (-6.5438) = 2.335$

Now $f(x_3) = f(2.335) = -2.2732$ i.e. the root lies between 2.335 and 3.

∴ taking $x_0 = 2.335$ and $x_1 = 3, f(x_0) = -2.2732$ and $f(x_1) = 49$ in (i), we obtain

$$x_4 = 2.335 - \frac{3 - 2.335}{49 + 2.2732} (-2.2732) = 2.3645$$

Repeating this process, the successive approximations are $x_5 = 2.3770, x_6 = 2.3779$ etc.

Since $x_5 = x_6$ upto 3 decimal places, we take $(32)^{1/4} = 2.378$.

(3) Newton-Raphson method*. Let x_0 be an approximate root of the equation $f(x) = 0$. If $x_1 = x_0 + h$ be the exact root, then $f(x_1) = 0$.

∴ expanding $f(x_0 + h)$ by Taylor's series

$$f(x_0) + hf'(x_0) + \frac{h^2}{2!} f''(x_0) + \dots = 0$$

Since h is small, neglecting h^2 and higher powers of h , we get

$$f(x_0) + hf'(x_0) = 0 \quad \text{or} \quad h = -\frac{f(x_0)}{f'(x_0)} \quad \dots(1)$$

∴ a closer approximation to the root is given by

$$x_1 = x_0 - \frac{f(x_0)}{f'(x_0)}.$$

Similarly, starting with x_1 , a still better approximation x_2 is given by

$$x_2 = x_1 - \frac{f(x_1)}{f'(x_1)}.$$

In general, $x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$...(2)

which is known as the *Newton-Raphson formula* or *Newton's iteration formula*.

Obs. 1. Newton's method is useful in cases of large values of $f'(x)$ i.e. when the graph of $f(x)$ while crossing the x -axis is nearly vertical.

Obs. 2. Newton's method has a second order of quadratic convergence. Suppose x_n differs from the root α by a small quantity ϵ_n so that $x_0 = \alpha + \epsilon_0$ and $x_{n+1} = \alpha + \epsilon_{n+1}$.

Then (2) becomes $\alpha + \epsilon_{n+1} = \alpha + \epsilon_n - \frac{f(\alpha + \epsilon_n)}{f'(\alpha + \epsilon_n)}$

$$\begin{aligned} \text{i.e., } \epsilon_{n+1} &= \epsilon_n - \frac{f(\alpha + \epsilon_n)}{f'(\alpha + \epsilon_n)} = \epsilon_n - \frac{f(\alpha) + \epsilon_n f'(\alpha) + \frac{1}{2!} \epsilon_n^2 f''(\alpha) + \dots}{f'(\alpha) + \epsilon_n f''(\alpha) + \dots} \\ &= \epsilon_n - \frac{\epsilon_n f'(\alpha) + \frac{1}{2!} \epsilon_n^2 f''(\alpha) + \dots}{f'(\alpha) + \epsilon_n f''(\alpha) + \dots} \quad [\because f(\alpha) = 0] \\ &= \frac{\epsilon_n^2 f''(\alpha)}{2(f'(\alpha) + \epsilon_n f''(\alpha))} = \frac{\epsilon_n^2}{2} \cdot \frac{f''(\alpha)}{f'(\alpha)} \end{aligned}$$

[By Taylor's expansion.]

[neglecting third and]

higher powers of ϵ_n]

This shows that the subsequent error at each step, is proportional to the square of the previous error and as such the convergence is quadratic.

(P.T.U., 2005)

Obs. 3. Geometrical interpretation. Let x_0 be a point near the root α of the equation $f(x) = 0$ (Fig. 28.3). Then the equation of the tangent at $A_0(x_0, f(x_0))$ is $y - f(x_0) = f'(x_0)(x - x_0)$.

*See footnote p. 466. Named after the English mathematician Joseph Raphson (1648–1715) who suggested a method similar to Newton's method.

It cuts the x -axis at $x_1 = x_0 - \frac{f(x_0)}{f'(x_0)}$ which is a first approximation

to the root α . If A_1 is the point corresponding to x_1 on the curve, then the tangent at A_1 will cut the x -axis at x_2 which is nearer to α and is, therefore, a second approximation to the root. Repeating this process, we approach to the root α quite rapidly. Hence the method consists in replacing the part of the curve between the point A_0 and the x -axis by means of the tangent to the curve at A_0 .

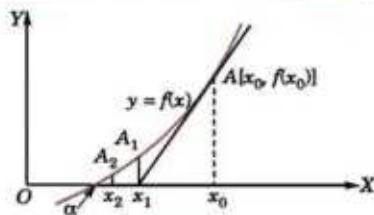

Fig. 28.3

Example 28.7. Find the positive root of $x^4 - x = 10$ correct to three decimal places, using Newton-Raphson method. (J.N.T.U., 2008; Madras, 2006)

Solution. Let $f(x) = x^4 - x - 10$

So that $f(1) = -10 = -\text{ve}, f(2) = 16 - 2 - 10 = 4 = +\text{ve}$

\therefore a root of $f(x) = 0$ lies between 1 and 2. Let us take $x_0 = 2$

Also $f'(x) = 4x^3 - 1$

Newton-Raphson's formula is

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} \quad \dots(i)$$

Putting $n = 0$, the first approximation x_1 is given by

$$x_1 = x_0 - \frac{f(x_0)}{f'(x_0)} = 2 - \frac{f(2)}{f'(2)} = 2 - \frac{4}{4 \times 2^3 - 1} = 2 - \frac{4}{31} = 1.871$$

Putting $n = 1$ in (i), the second approximation is

$$\begin{aligned} x_2 &= x_1 - \frac{f(x_1)}{f'(x_1)} = 1.871 - \frac{f(1.871)}{f'(1.871)} \\ &= 1.871 - \frac{(1.871)^4 - (1.871) - 10}{4(1.871)^3 - 1} = 1.871 - \frac{0.3835}{25.199} = 1.856 \end{aligned}$$

Putting $n = 2$ in (i), the third approximation is

$$\begin{aligned} x_3 &= x_2 - \frac{f(x_2)}{f'(x_2)} = 1.856 - \frac{(1.856)^4 - (1.856) - 10}{4(1.856)^3 - 1} \\ &= 1.856 - \frac{0.010}{24.574} = 1.856 \end{aligned}$$

Here $x_2 = x_3$. Hence the desired is 1.856 correct to three decimal places.

Example 28.8. Find the Newton's method, the real root of the equation $3x = \cos x + 1$.

(V.T.U., 2009; S.V.T.U., 2007)

Solution. Let $f(x) = 3x - \cos x - 1$

$$f(0) = -2 = -\text{ve}, f(1) = 3 - 0.5403 - 1 = 1.4597 = +\text{ve}.$$

So a root of $f(x) = 0$ lies between 0 and 1. It is nearer to 1. Let us take $x_0 = 0.6$.

Also $f'(x) = 3 + \sin x$

\therefore Newton's iteration formula gives

$$\begin{aligned} x_{n+1} &= x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{3x_n - \cos x_n - 1}{3 + \sin x_n} \\ &= \frac{x_n \sin x_n + \cos x_n + 1}{3 + \sin x_n} \quad \dots(i) \end{aligned}$$

Putting $n = 0$, the first approximation x_1 is given by

$$x_1 = \frac{x_0 \sin x_0 + \cos x_0 + 1}{3 + \sin x_0} = \frac{(0.6) \sin (0.6) + \cos (0.6) + 1}{3 \sin (0.6)}$$

$$= \frac{0.6 \times 0.5729 + 0.82533 + 1}{3 + 0.5729} = 0.6071$$

Putting $n = 1$ in (i), the second approximation is

$$\begin{aligned}x_2 &= \frac{x_1 \sin x_1 + \cos x_1 + 1}{3 + \sin x_1} = \frac{0.6071 \sin(0.6071) + \cos(0.6071) + 1}{3 + \sin(0.6071)} \\&= \frac{0.6071 \times 0.57049 + 0.8213 + 1}{3 + 0.57049} = 0.6071 \quad \text{Clearly, } x_1 = x_2.\end{aligned}$$

Hence the desired root is 0.6071 correct to four decimal places.

Example 28.9. Using Newton's iterative method, find the real root of $x \log_{10} x = 1.2$ correct to five decimal places.
(V.T.U., 2005 ; Mumbai, 2004 ; Burdwan, 2003)

Solution. Let $f(x) = x \log_{10} x - 1.2$

$$f(1) = -1.2 = \text{ve}, f(2) = 2 \log_{10} 2 - 1.2 = 0.59794 = \text{ve}$$

$$\text{and } f(3) = 3 \log_{10} 3 - 1.2 = 1.4314 - 1.2 = 0.23136 = \text{+ ve}$$

So a root of $f(x) = 0$ lies between 2 and 3. Let us take $x_0 = 2$

$$\text{Also } f'(x) = \log_{10} x + x \cdot \frac{1}{x} \log_{10} e = \log_{10} x + 0.43429$$

\therefore Newton's iteration formula gives

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = \frac{0.43429 x_n + 1.2}{\log_{10} x_n + 0.43429} \quad \dots(i)$$

Putting $n = 0$, the first approximation is

$$x_1 = \frac{0.43429 \times x_0 + 1.2}{\log_{10} x_0 + 0.43429} = \frac{0.43429 \times 2 + 1.2}{\log_{10} 2 + 0.43429} = \frac{0.86858 + 1.2}{0.30103 + 0.43429} = 2.81$$

Similarly putting $n = 1, 2, 3, 4$ in (i), we get

$$x_2 = \frac{0.43429 \times 2.81 + 1.2}{\log_{10} 2.81 + 0.43429} = 2.741$$

$$x_3 = \frac{0.43429 \times 2.741 + 1.2}{\log_{10} 2.741 + 0.43429} = 2.74064$$

$$x_4 = \frac{0.43429 \times 2.74064 + 1.2}{\log_{10} 2.74064 + 0.43429} = 2.74065$$

$$x_5 = \frac{0.43429 \times 2.74065 + 1.2}{\log_{10} 2.74065 + 0.43429} = 2.74065$$

Clearly $x_4 = x_5$.

Hence the required root is 2.74065 correct to five decimal places.

28.3 USEFUL DEDUCTIONS FROM THE NEWTON-RAPHSON FORMULA

(1) Iterative formula to find $1/N$ is $x_{n+1} = x_n (2 - Nx_n)$

(2) Iterative formula to find \sqrt{N} is $x_{n+1} = \frac{1}{2}(x_n + N/x_n)$

(3) Iterative formula to find $1/\sqrt{N}$ is $x_{n+1} = \frac{1}{2}(x_n + 1/Nx_n)$

(4) Iterative formula to find $\sqrt[k]{N}$ is $x_{n+1} = \frac{1}{k}[(k-1)x_n + N/x_n^{k-1}]$

Proofs. (1) Let $x = 1/N$ or $1/x - N = 0$

Taking $f(x) = 1/x - N$, we have $f'(x) = -x^{-2}$

Then Newton's formula gives

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{(1/x_n - N)}{-x_n^{-2}} = x_n + \left(\frac{1}{x_n} - N\right)x_n^2 = x_n + x_n - Nx_n^2 = x_n(2 - Nx_n)$$

(2) Let $x = \sqrt{N}$ or $x^2 - N = 0$

Taking $f(x) = x^2 - N$, we have $f'(x) = 2x$

Then Newton's formula gives

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^2 - N}{2x_n} = \frac{1}{2}(x_n + N/x_n)$$

(Madras, 2006)

(3) Let $x = \frac{1}{\sqrt{N}}$ or $x^2 - \frac{1}{N} = 0$

Taking $f(x) = x^2 - 1/N$, we have $f'(x) = 2x$

Then Newton's formula gives

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^2 - 1/N}{2x_n} = \frac{1}{2}\left(x_n + \frac{1}{Nx_n}\right)$$

(4) Let $x = \sqrt[k]{N}$ or $x^k - N = 0$

Taking $f(x) = x^k - N$, we have $f'(x) = kx^{k-1}$

Then Newton's formula gives

$$x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)} = x_n - \frac{x_n^k - N}{kx_n^{k-1}} = \frac{1}{k}\left[(k-1)x_n + \frac{N}{x_n^{k-1}}\right].$$

Example 28.10. Evaluate the following (correct to four decimal places) by Newton's iteration method :

(i) $\sqrt[3]{31}$ (ii) $\sqrt{5}$ (Anna, 2007)

(iii) $\sqrt[4]{14}$ (iv) $\sqrt[3]{24}$ (Madras, 2003) (v) $(30)^{-1/5}$.

Solution. (i) Taking $N = 31$, the above formula (1) becomes

$$x_{n+1} = x_n(2 - 31x_n)$$

Since an approximate value of $1/31 = 0.03$, we take $x_0 = 0.03$

Then $x_1 = x_0(2 - 31x_0) = 0.03(2 - 31 \times 0.03) = 0.0321$

$$x_2 = x_1(2 - 31x_1) = 0.0321(2 - 31 \times 0.0321) = 0.032257$$

$$x_3 = x_2(2 - 31x_2) = 0.032257(2 - 31 \times 0.032257) = 0.03226$$

Since $x_2 = x_3$ upto 4 decimal places, we have $1/31 = 0.0323$.

(ii) Taking $N = 5$, the above formula (2), becomes $x_{n+1} = \frac{1}{2}(x_n + 5/x_n)$

Since an approximate value of $\sqrt{5} = 2$, we take $x_0 = 2$.

Then $x_1 = \frac{1}{2}(x_0 + 5/x_0) = \frac{1}{2}(2 + 5/2) = 2.25$

$$x_2 = \frac{1}{2}(x_1 + 5/x_1) = 2.2361$$

$$x_3 = \frac{1}{2}(x_2 + 5/x_2) = 2.2361$$

Since $x_2 = x_3$ upto 4 decimal places, we have $\sqrt{5} = 2.2361$.

(iii) Taking $N = 14$, the above formula (3), becomes $x_{n+1} = \frac{1}{2}[x_n + 1/(14x_n)]$

Since an approximate value of $1/\sqrt{14} = 1/\sqrt{16} = \frac{1}{4} = 0.25$, we take $x_0 = 0.25$

Then $x_1 = \frac{1}{2}[x_0 + (14x_0)^{-1}] = \frac{1}{2}[0.25 + (14 \times 0.25)^{-1}] = 0.26785$

$$x_2 = \frac{1}{2}[x_1 + (14x_1)^{-1}] = \frac{1}{2}[0.26785 + (14 \times 0.26785)^{-1}] = 0.2672618$$

$$x_3 = \frac{1}{2}[x_2 + (14x_2)^{-1}] = \frac{1}{2}[0.2672618 + (14 \times 0.2672618)^{-1}] = 0.2672612$$

Since $x_2 = x_3$ upto 4 decimal places, we take $1/\sqrt{14} = 0.2673$.

(iv) Taking $N = 24$ and $k = 3$, the above formula (4) becomes $x_{n+1} = \frac{1}{3}[2x_n + 24/x_n^2]$

Since an approximate value of $(24)^{1/3} = (27)^{1/3} = 3$, we take $x_0 = 3$.

$$\text{Then } x_1 = \frac{1}{3}(2x_0 + 24/x_0^2) = \frac{1}{3}(6 + 24/9) = 2.88889$$

$$x_2 = \frac{1}{3}(2x_1 + 24/x_1^2) = \frac{1}{3}[(2 \times 2.88889) + 24/(2.88889)^2] = 2.88451$$

$$x_3 = \frac{1}{3}(2x_2 + 24/x_2^2) = \frac{1}{3}[2 \times 2.88451 + 24/(2.88451)^2] = 2.8845$$

Since $x_2 = x_3$ upto 4 decimal places, we take $(24)^{1/3} = 2.8845$

(v) Taking $N = 30$ and $k = -5$, the above formula (4) becomes

$$x_{n+1} = \frac{1}{-5}(-6x_n + 30/x_n^{-6}) = \frac{x_n}{5}(6 - 30x_n^5)$$

Since an approximate value of $(30)^{-1/5} = (32)^{-1/5} = 1/2$, we take $x_0 = 1/2$

$$\text{Then } x_1 = \frac{x_0}{5}(6 - 30x_0^5) = \frac{1}{10}(6 - 30/2^5) = 0.50625$$

$$x_2 = \frac{x_1}{5}(6 - 30x_1^5) = \frac{0.50625}{5}[6 - 30(0.50625)^5] = 0.506495$$

$$x_3 = \frac{x_2}{5}(6 - 30x_2^5) = \frac{0.506495}{5}[6 - 30(0.506495)^5] = 0.506496.$$

Since $x_2 = x_3$ upto 4 decimal places, we take $(30)^{-1/5} = 0.5065$.

PROBLEMS 26.1

- Find a root of the following equations, using the bisection method correct to three decimal places :
 - $x^2 - 2x - 5 = 0$ (P.T.U., 2005)
 - $x^2 - x^2 - 1 = 0$ (J.N.T.U., 2009)
 - $x^2 - x - 11 = 0$ which lies between 2 and 3
 - $2x^3 + x^2 - 20x + 12 = 0$.
- Using the bisection method, find a real root of the following equations correct to three decimal places :
 - $\cos x = xe^x$ (Mumbai, 2004)
 - $x \log_{10} x = 1.2$ lying between 2 and 3
 - $e^x - x = 2$ lying between 1 and 1.4
 - $e^x = 4 \sin x$.
- Find a real root of the following equations correct to three decimal places by the method of false position :
 - $x^2 + x - 1 = 0$
 - $x^3 - 4x - 9 = 0$ (V.T.U., 2007)
 - $x^2 + x - 1 = 0$ near $x = 1$
 - $x^6 - x^4 - x^3 - 1 = 0$. (Nagarkravati, 2001)
- Using regula-falsi method, compute the real root of the following equations correct to three decimal places :
 - $xe^x = 2$ (S.V.T.U., 2007)
 - $\cos x = 3x - 1$
 - $x \tan x - 1 = 0$ (P.T.U., 2006)
 - $2x - \log x = 7$ (J.N.T.U., 2006)
 - $xe^x = \sin x$. (P.T.U., 2006)
- Find the fourth root of 12 correct to three decimal places using the method of false position.
- Find by Newton's method, a root of the following equations correct to 3 decimal places :
 - $x^3 - 3x + 1 = 0$ (Bhopal, 2009)
 - $x^2 - 2x - 5 = 0$ (P.T.U., 2005)
 - $x^3 - 5x + 3 = 0$ (Mumbai, 2004)
 - $3x^3 - 9x^2 + 8 = 0$ lying between 1 and 2. (Madras, 2003)
- Find a root of the following equations correct to three significant figures using Newton's iterative method :
 - $x^4 + x^3 - 7x^2 - x + 5 = 0$ lying between 2 and 3 (Madras, 2003)
 - $x^6 - 5x^2 + 3 = 0$.
- Find the negative root of the equation $x^3 - 21x + 3500 = 0$ correct to two decimal places by Newton's method.
- Using Newton-Raphson method, find a root of the following equations correct to the three decimal places :
 - $x^2 - 2 = 0$ (V.T.U., 2005)
 - $x^2 + 4 \sin x = 0$ (Hazaribagh, 2009)
 - $x \tan x + 1 = 0$ which is near $x = \pi$ (J.N.T.U., 2006; V.T.U., 2006)
 - $e^x = x^2 + \cos 25x$ which is near $x = 4.5$. (V.T.U., 2007)
- Find by Newton's method, the root of the equations :
 - $\cos x = xe^x$ (J.N.T.U., 2009; V.T.U., 2003)
 - $x \log_{10} x = 12.34$
 - $10^x + x - 4 = 0$
 - $x + \log_{10} x = 3.375$ (Rohtak, 2003)
- Develop a recurrence formula for finding \sqrt{N} , using Newton-Raphson method and hence compute to three decimal places
 - $\sqrt{13}$ (U.P.T.U., 2008)
 - $\sqrt{10}$ (J.N.T.U., 2008)

12. Find the cube root of 41, using Newton-Raphson method. (Madras, 2003)
13. Develop an algorithm using N-R method, to find the fourth root of a positive number N and hence find $(32)^{1/4}$. (W.B.T.U., 2005)
14. Evaluate the following (correct to 3 decimal places) by using the Newton-Raphson method :
 (i) $1/18$ J.N.T.U., 2004 (ii) $1/\sqrt{15}$ (iii) $(28)^{-1/4}$.

28.4 APPROXIMATE SOLUTION OF EQUATIONS—HORNER'S METHOD

This is the best method of finding approximate values of both rational and irrational roots of a numerical equation. Horner's method consists in diminution of the root of an equation by successive digits occurring in the roots.

If the root of an equation lies between a and $a + 1$, then the value of this root will be $a . bcd \dots$, where $b, c, d \dots$ are digits in its decimal part. To obtain these, we proceed as follows :

- (i) Diminish the roots of the given equation by a so that the root of the new equation is $0 . bcd \dots$
- (ii) Then multiply the roots of the transformed equation by 10 so that the root of the new equation is $b . cd \dots$
- (iii) Now diminish the root by b and multiply the roots of the resulting equation by 10 so that the root is $c . d \dots$
- (iv) Next diminish the root by c and so on. By continuing this process, the root may be evaluated to any desired degree of accuracy digit by digit. The method will be clear from the following example.

Example 28.11. Find by Horner's method, the positive root of the equation $x^3 + x^2 + x - 100 = 0$ correct to three decimal places.

Solution. Step I. Let $f(x) = x^3 + x^2 + x - 100$

By Descartes' rule of signs, there is only one positive root. Also $f(4) = -ve$ and $f(5) = +ve$, therefore, the root lies between 4 and 5.

Step II. Diminish the roots of given equation by 4 so that the transformed equation is

$$x^3 + 13x^2 + 57x - 16 = 0 \quad \dots(i)$$

Its root lies between 0 and 1. (We draw a zig-zag line above the set of figures 13, 57, -16 which are the coefficients of the terms in (i) as shown below. Now multiply the roots of (i) by 10 for which multiply the second term by 10, the third term by 100 and the fourth term by 1000 (i.e. attach one zero to the second term, two zeros to the third term and three zeros to the fourth term). Then we get the equation

$$f_1(x) = x^3 + 130x^2 + 5700x - 16000 = 0 \quad \dots(ii)$$

1	1	1	-100 (4.264)
4	20		84
5	21		-16000
4	36		11928
9	5700		-4072000
4	264		3788376
130	5964		-283624000
2	268		
132	623200		
2	8196		
134	631396		
2	8232		
1360	63962800		
6			
1366			
6			
1372			
6			
13780			

Its root lies between 0 and 10.

Clearly $f_1(2) = -\text{ve}, f_1(3) = +\text{ve}$

\therefore the root of (ii) lies between 2 and 3 i.e., first figure after decimal is 2.

Step III. Diminish the roots of $f_1(x) = 0$ by 2 so that the next transformed equation is

$$x^3 + 136x^2 + 6232x - 4072 = 0 \quad \dots(iii)$$

Its root lies between 0 and 1. (We draw the second zig-zag line above the set of figures 136, 6232, -4072.) Multiply the roots of (iii), by 10, i.e. attach one zero to second term, two zeros to third term and three zeros to the fourth term. Then the new equation is

$$f_2(x) = x^3 + 1360x^2 + 623200x - 4072000 = 0$$

Its root lies between 0 and 10, which is nearly $= \frac{4072000}{623200} = 6$

Hence second figure after decimal place is 6.

Step IV. Diminish the roots of $f_2(x) = 0$ by 6, so that the transformed equation is

$$x^3 + 1378x^2 + 639628x - 283624 = 0.$$

Its root lies between 0 and 1. (We draw the third zig-zag line above the set of figures 1378, 639628, -283624.) As before multiply its roots by 10, i.e. attach one zero to the second term, two zeros to the third term and three zeros to the fourth term. Then the equation becomes

$$f_3(x) = x^3 + 13780x^2 + 63962800x - 283624000 = 0$$

Its root lies between 0 and 10, which is nearly $= \frac{283624000}{63962800} = 4$. Thus the roots of $f_3(x) = 0$ are to be diminished by 4 i.e. the third figure after decimal place is 4. But there is no need to proceed further as the root is required correct to three decimal places only. Hence the root is 4.264.

Obs. 1. After two steps of diminishing, we apply the principle of trial divisor in which we divide the last coefficient by last but one coefficient to get the next integer by which the roots are to be diminished. These last two coefficients should have opposite signs.

Obs. 2. At any stage if the trial divisor suggests the next integer to be zero, then we should again multiply the roots by 10 and write zero in decimal place of the root.

Example 28.12. Find the cube root of 30 correct to 3 decimal places, using Horner's method.

Solution. **Step I.** Let $x = \sqrt[3]{30}$ i.e. $f(x) = x^3 - 30 = 0$

Now $f(3) = -3$ (-ve), $f(4) = 34$ (+ve)

\therefore the root lies between 3 and 4.

Step II. Diminish the roots of the given equation by 3 so that the transformed equation is

$$x^3 + 9x^2 + 27x - 3 = 0 \quad \dots(i)$$

Its roots lie between 0 and 1. (We draw a zig-zag line above the set of numbers 9, 27, -3 which are the coefficients of the terms in (i)). Now multiply the roots of (i) by 10 for which attach one zero to the second term, two zeros to the third term and three zeros to the fourth term. Then we get the equation

$$f_1(x) = x^3 + 90x^2 + 2700x - 3000 = 0 \quad \dots(ii)$$

Its roots lie between 0 and 10.

Clearly $f_1(1) = -\text{ve}, f_1(2) = +\text{ve}$

\therefore the root of (ii) lies between 1 and 2 i.e., first figure after decimal place is 1.

Step III. Diminish the roots of $f_1(x) = 0$ by 1, so that the next transformed equation is

$$x^3 + 93x^2 + 2883x - 209 = 0 \quad \dots(iii)$$

Its root lies between 0 and 1. (We draw a second zig-zag line above the set of figures 93, 2883, -209.) Multiply the roots of (iii) by 10 i.e., attach one zero to second term, two zeros to third term and three zeros to the fourth term. Then the new equation is

$$f_2(x) = x^3 + 930x^2 + 288300x - 209000 = 0$$

Its root lies between 0 and 10, which is nearly

$$= 209000/288300 = 0.724 > 0 \text{ and } < 1.$$

Hence second figure after decimal place is 0.

1	0	0	-30	(3.107)
3	9	27		
3	9	-30000		
3	18	2791		
6	2700	-209000000		
3	91			
90	2791			
1	92			
91	28830000			
1				
92				
1				
9300				

Step IV. Diminish the root of $f_2(x) = 0$ by 0 and then multiply its roots by 10 so that

$$f_3(x) = x^3 + 9300x^2 + 28830000x - 209000000 = 0.$$

Its root lies between 0 and 10, which is nearly $= 209000000/28830000 = 7.2 > 7$ and < 8 . Thus the roots of $f_3(x) = 0$ are to be diminished by 7 i.e., the third figure after decimal is 7. Hence the required root is 3.107.

PROBLEMS 28.2

1. Find by Horner's method, the root (correct to three decimal places) of the equation

$$(i) x^3 - 3x + 1 = 0 \text{ which lies between 1 and 2.}$$

$$(ii) x^2 + x - 1 = 0 \quad (\text{Coimbatore, 1997})$$

$$(iii) x^3 - 6x - 13 = 0$$

$$(iv) x^3 - 3x^2 + 2.5 = 0 \text{ which lies between 1 and 2.}$$

(Madras, 2000 S)

2. Using Horner's method, find the largest real root of $x^3 - 4x + 2 = 0$ correct to three decimal places.

3. Show that the root of the equation $x^4 + x^3 - 4x^2 - 16 = 0$ lies between 2 and 3. Find its value correct to two decimal places by Horner's method.

4. Find the negative root of the equation $x^3 - 9x^2 + 18 = 0$ correct to two decimal places by Horner's method.

5. Find the cube root of 25 by Horner's method correct to 3 decimal places.

28.5 SOLUTION OF LINEAR SIMULTANEOUS EQUATIONS

Simultaneous linear equations occur in various engineering problems. The student knows that a given system of linear equations can be solved by Cramer's rule or by Matrix method (§ 2.10). But these methods become tedious for large systems. However, there exist other numerical methods of solution which are well-suited for computing machines. We now explain some direct and iterative methods of solution.

28.6 DIRECT METHODS OF SOLUTION

(1) **Gauss elimination method***. In this method, the unknowns are eliminated successively and the system is reduced to an upper triangular system from which the unknowns are found by back substitution. The method is quite general and is well-adapted for computer operations. Here we shall explain it by considering a system of three equations for the sake of clarity.

Consider the equations

$$\left. \begin{aligned} a_1x + b_1y + c_1z &= d_1 \\ a_2x + b_2y + c_2z &= d_2 \\ a_3x + b_3y + c_3z &= d_3 \end{aligned} \right\} \quad \dots(1)$$

Step I. To eliminate x from second and third equations.

Assuming $a_1 \neq 0$, we eliminate x from the second equation by subtracting (a_2/a_1) times the first equation from the second equation. Similarly we eliminate x from the third equation by eliminating (a_3/a_1) times the first equation from the third equation. We thus, get the new system

*See footnote p. 37.

$$\left. \begin{array}{l} a_1x + b_1y + c_1z = d_1 \\ b'_2y + c'_2z = d'_2 \\ b'_3y + c'_3z = d'_3 \end{array} \right\} \quad \dots(2)$$

Here the first equation is called the *pivotal equation* and a_1 is called the *first pivot*.

Step II. To eliminate y from third equation in (2).

Assuming $b'_2 \neq 0$, we eliminate y from the third equation of (2), by subtracting (b'_3/b'_2) times the second equation from the third equation. We thus, get the new system

$$\left. \begin{array}{l} a_1x + b_1y + c_1z = d_1 \\ b'_2y + c'_2z = d'_2 \\ c'_3z = d'_3 \end{array} \right\} \quad \dots(3)$$

Here the second equation is the *pivotal equation* and b'_2 is the *new pivot*.

Step III. To evaluate the unknowns.

The values of x, y, z are found from the reduced system (3) by back substitution.

Obs. 1. On writing the given equations as $\begin{bmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}$ i.e., $AX = D$, this method consists in transforming the coefficient matrix A to upper triangular matrix by elementary row transformations only.

Obs. 2. Clearly the method will fail if any one of the pivots a_1, b'_2 or c'_3 becomes zero. In such cases, we rewrite the equations in a different order so that the pivots are non-zero.

Obs. 3. *Partial and complete pivoting.* In the first step, the numerically largest coefficient of x is chosen from all the equations and brought as the first pivot by interchanging the first equation with the equation having the largest coefficient of x . In the second step, the numerically largest coefficient of y is chosen from the remaining equations (leaving the first equation) and brought as the *second pivot* by interchanging the second equation with the equation having the largest coefficient of y' . This process is continued till we arrive at the equation with the single variable. This modified procedure is called *partial pivoting*.

If we are not taken about the elimination of x, y, z in a specified order, then we choose at each stage the numerically largest coefficient of the entire matrix of coefficients. This requires not only an interchange of equations but also an interchange of the position of the variables. This method of elimination is called *complete pivoting*. It is more complicated and does not appreciably improve the accuracy.

Example 28.13. Apply Gauss elimination method to solve the equations $x + 4y - z = -5$; $x + y - 6z = -12$; $3x - y - z = 4$.
(Mumbai, 2009)

Check sum

Solution. We have $x + 4y - z = -5$...(i)

$$x + y - 6z = -12 \quad \dots(ii)$$

$$3x - y - z = 4 \quad \dots(iii)$$

Step I. Operate (ii) – (i) and (iii) – 3(i) to eliminate x :

Check sum

$$-3y - 5z = -7 \quad -15 \quad \dots(iv)$$

$$-13y + 2z = 19 \quad 8 \quad \dots(v)$$

Step II. Operate (v) – $\frac{13}{3}$ (iv) to eliminate y :

Check sum

$$\frac{71}{3}z = \frac{148}{3} \quad 73 \quad \dots(vi)$$

Step III. By back-substitution, we get

$$\text{From (vi): } z = \frac{148}{71} = 2.0845$$

$$\text{From (iv): } y = \frac{7}{3} - \frac{5}{3}\left(\frac{148}{71}\right) = -\frac{81}{71} = -1.1408$$

$$\text{From (i) : } x = -5 - 4 \left(-\frac{81}{71} \right) + \frac{148}{71} = \frac{117}{71} = 1.6479$$

Hence $x = 1.6479, y = -1.1408, z = 2.0845$

Note. A useful check is provided by noting the sum of the coefficients and terms on the right, operating on those numbers as on the equations and checking that the derived equations have the correct sum.

$$\text{Otherwise : We have } \begin{bmatrix} 1 & 4 & -1 \\ 1 & 1 & -6 \\ 3 & -1 & -1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -5 \\ -12 \\ 4 \end{bmatrix}$$

$$\text{Operate } R_2 - R_1 \text{ and } R_3 - 3R_1, \quad \begin{bmatrix} 1 & 4 & -1 \\ 0 & -3 & -5 \\ 0 & -13 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -5 \\ -7 \\ 19 \end{bmatrix}$$

$$\text{Operate } R_3 - \frac{13}{3}R_2, \quad \begin{bmatrix} 1 & 4 & -1 \\ 0 & -3 & -5 \\ 0 & 0 & 71/3 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} -5 \\ -7 \\ 148/3 \end{bmatrix}$$

Thus, we have $z = 148/71 = 2.0845$,

$$3y = 7 - 5z = 7 - 10.4225 = -3.4225 \quad i.e., \quad y = -1.1408$$

$$\text{and} \quad x = -5 - 4y + z = -5 + 4(-1.1408) + 2.0845 = 1.6479$$

Hence $x = 1.6479, y = -1.1408, z = 2.0845$.

Example 28.14. Solve $10x - 7y + 3z + 5u = 6, -6x + 8y - z - 4u = 5, 3x + y + 4z + 11u = 2, 5x - 9y - 2z + 4u = 7$ by Gauss elimination method. (S.V.T.U., 2007)

Check sum		
Solution. We have	$10x - 7y + 3z + 5u = 6$	17
	$-6x + 8y - z - 4u = 5$	2
	$3x + y + 4z + 11u = 2$	21
	$5x - 9y - 2z + 4u = 7$	5

Step I. To eliminate x , operate $\left[(ii) - \left(\frac{-6}{10} \right) (i) \right], \left[(iii) - \left(\frac{3}{10} \right) (i) \right], \left[(iv) - \left(\frac{5}{10} \right) (i) \right]$:

Check sum

$$3.8y + 0.8z - u = 8.6 \quad 12.2 \quad \dots(v)$$

$$3.1y + 3.1z + 9.5u = 0.2 \quad 15.9 \quad \dots(vi)$$

$$-5.5y - 3.5z + 1.5u = 4 \quad -3.5 \quad \dots(vii)$$

Step II. To eliminate y , operate $\left[(vi) - \left(\frac{3.1}{3.8} \right) (v) \right], \left[(vii) - \left(\frac{-5.5}{3.8} \right) (v) \right]$:

$$2.4473684z + 10.315789u = -6.8157895 \quad \dots(viii)$$

$$-2.3421053z + 0.0526315u = 16.447368 \quad \dots(ix)$$

Step III. To eliminate z , operate $\left[(ix) - \left(\frac{-2.3421053}{2.4473684} \right) (viii) \right]$:

$$9.9249319u = 9.9245977$$

Step IV. By back-substitution, we get

$$u = 1, z = -7, y = 4 \text{ and } x = 5.$$

(2) Gauss-Jordan method*. This is a modification of the Gauss elimination method. In this method, elimination of unknowns is performed not in the equations below but in the equations above also, ultimately **reducing the system to a diagonal matrix form i.e., each equation involving only one unknown. From these equations the unknowns x, y, z can be obtained readily.**

Thus in this method, the labour of back-substitution for finding the unknowns is saved at the cost of additional calculations.

*See footnote p. 37.

Example 28.15. Apply Gauss-Jordan method to solve the equations

$$x + y + z = 9; 2x - 3y + 4z = 13; 3x + 4y + 5z = 40.$$

(V.T.U., 2009; P.T.U., 2005)

Solution. We have

$$x + y + z = 9 \quad \dots(i)$$

$$2x - 3y + 4z = 13 \quad \dots(ii)$$

$$3x + 4y + 5z = 40 \quad \dots(iii)$$

Step I. Operate (ii) - 2(i) and (iii) - 3(i) to eliminate x from (ii) and (iii).

$$x + y + z = 9 \quad \dots(iv)$$

$$-5y + 2z = -5 \quad \dots(v)$$

$$y + 2z = 13 \quad \dots(vi)$$

Step II. Operate (iv) + $\frac{1}{5}$ (v) and (vi) + $\frac{1}{5}$ (v) to eliminate y from (iv) and (vi) :

$$x + \frac{7}{5}z = 8 \quad \dots(vii)$$

$$-5y + 2z = -5 \quad \dots(viii)$$

$$\frac{12}{5}z = 12 \quad \dots(ix)$$

Step III. Operate (vii) - $\frac{7}{12}$ (ix) and (viii) - $\frac{5}{6}$ (ix) to eliminate z from (vii) and (viii) :

$$x = 1$$

$$-5y = -15$$

$$\frac{12}{5}z = 12$$

Hence the solution is $x = 1, y = 3, z = 5$.

Otherwise : Rewriting the equations as

$$\begin{bmatrix} 1 & 1 & 1 \\ 2 & -3 & 4 \\ 3 & 4 & 5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 9 \\ 13 \\ 40 \end{bmatrix}$$

Operate $R_2 - 2R_1, R_3 - 3R_1,$

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & -5 & 2 \\ 0 & 1 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 9 \\ -5 \\ 13 \end{bmatrix}$$

Operate $R_3 + \frac{1}{5}R_2,$

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & -5 & 2 \\ 0 & 0 & 12/5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 9 \\ -5 \\ 12 \end{bmatrix}$$

Operate $-R_2, 5R_3$

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & 5 & -2 \\ 0 & 0 & 12 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 9 \\ 5 \\ 60 \end{bmatrix}$$

Operate $R_2 + \frac{1}{6}R_3, \frac{1}{12}R_3$

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & 5 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 9 \\ 15 \\ 5 \end{bmatrix}$$

Operate $\frac{1}{5}R_2$

$$\begin{bmatrix} 1 & 1 & 1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 9 \\ 3 \\ 5 \end{bmatrix}$$

Operate $R_1 - R_2 - R_3$

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 1 \\ 3 \\ 5 \end{bmatrix}$$

Hence, $x = 1, y = 3, z = 5.$

Obs. Here the process of elimination of variables amounts to reducing the given coefficient metric to a diagonal matrix by elementary row transformations only.

Example 28.16. Solve the equations of example 28.14, by Gauss-Jordan method.

Solution. We have

$$\begin{aligned} 10x - 7y + 3z + 5u &= 6 & \dots(i) \\ -6x + 8y - z - 4u &= 5 & \dots(ii) \\ 3x + y + 4z + 11u &= 2 & \dots(iii) \\ 5x - 9y - 2z + 4u &= 7 & \dots(iv) \end{aligned}$$

Step I. To eliminate x , operate $\left[(ii) - \left(\frac{-6}{10} \right) (i) \right], \left[(iii) - \left(\frac{3}{10} \right) (i) \right], \left[(iv) - \left(\frac{5}{10} \right) (i) \right] :$

$$\begin{aligned} 10x - 7y + 3z + 5u &= 6 & \dots(v) \\ 3.8y + 0.8z - u &= 8.6 & \dots(vi) \\ 3.1y + 3.1z + 9.5u &= 0.2 & \dots(vii) \\ -5.5y - 3.5z + 1.5u &= 4 & \dots(viii) \end{aligned}$$

Step II. To eliminate y , operate $\left[(v) - \left(\frac{-7}{3.8} \right) (vi) \right], \left[(vii) - \left(\frac{3.1}{3.8} \right) (vi) \right], \left[(viii) - \left(\frac{-5.5}{3.8} \right) (vi) \right] :$

$$\begin{aligned} 10x + 4.4736842z + 3.1578947u &= 21.842105 & \dots(ix) \\ 3.8y + 0.8z - u &= 8.6 & \dots(x) \\ 2.4473684z + 10.315789u &= -6.8157895 & \dots(xi) \\ -2.3421053z + 0.0526315u &= 16.447368 & \dots(xii) \end{aligned}$$

Step III. To eliminate z , operate $\left[(ix) - \left(\frac{4.473684}{2.4473684} \right) (xi) \right],$

$$\left[(x) - \left(\frac{0.8}{2.4473684} \right) (xi) \right], \left[(xii) - \left(\frac{-2.3421053}{2.4473684} \right) (xi) \right] :$$

$$\begin{aligned} 10x - 15.698923u &= 34.301075 \\ 3.8y - 4.3720429u &= 10.827957 \\ 2.4473684z + 10.315789u &= -6.8157895 \\ 9.9247309u &= 9.9245975 \end{aligned}$$

Step IV. From the last equation $u = 1$ nearly.

Substitution of $u = 1$ in the above three equations gives $x = 5, y = 4, z = -7$.

(3) Factorization method*. This method is based on the fact that every matrix A can be expressed as the product of a lower triangular matrix and an upper triangular matrix, provided all the principal minors of A are non-singular, i.e., if $A = [a_{ij}]$, then

$$a_{11} \neq 0, \begin{vmatrix} a_{11} & a_{12} \\ a_{21} & a_{22} \end{vmatrix} \neq 0, \begin{vmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{vmatrix} \neq 0, \text{etc.}$$

Also such a factorization if it exists, is unique.

Now consider the equations

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 + a_{13}x_3 &= b_1 \\ a_{21}x_1 + a_{22}x_2 + a_{23}x_3 &= b_2 \\ a_{31}x_1 + a_{32}x_2 + a_{33}x_3 &= b_3 \end{aligned}$$

which can be written as

$$AX = B \quad \dots(1)$$

where

$$A = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}, X = \begin{bmatrix} x_1 \\ x_2 \\ x_3 \end{bmatrix} \text{ and } B = \begin{bmatrix} b_1 \\ b_2 \\ b_3 \end{bmatrix}$$

Let

$$A = LU, \quad \dots(2)$$

where

$$L = \begin{bmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{bmatrix} \text{ and } U = \begin{bmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{bmatrix}$$

*Another name given to this decomposition is Doolittle's method.

Then (1) becomes $LUX = B$... (3)

Writing $UX = V$, ... (4)

(3) becomes $LV = B$ which is equivalent to the equations

$$v_1 = b_1; l_{21}v_1 + v_2 = b_2; l_{31}v_1 + l_{32}v_2 + v_3 = b_3$$

Solving these for v_1, v_2, v_3 , we know V . Then, (4) becomes

$$u_{11}x_1 + u_{12}x_2 + u_{13}x_3 = v_1; u_{22}x_2 + u_{23}x_3 = v_2; u_{33}x_3 = v_3,$$

from which x_3, x_2 and x_1 can be found by back-substitution.

To compute the matrices L and U , we write (2) as

$$\begin{bmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 0 \end{bmatrix} \begin{bmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{bmatrix} = \begin{bmatrix} a_{11} & a_{12} & a_{13} \\ a_{21} & a_{22} & a_{23} \\ a_{31} & a_{32} & a_{33} \end{bmatrix}$$

Multiplying the matrices on the left and equating corresponding elements from both sides, we obtain

$$(i) \quad u_{11} = a_{11}, \quad u_{12} = a_{12}, \quad u_{13} = a_{13}$$

$$(ii) \quad l_{21}u_{11} = a_{21} \quad \text{or} \quad l_{21} = a_{21}/a_{11}$$

$$l_{31}u_{11} = a_{31} \quad \text{or} \quad l_{31} = a_{31}/a_{11}$$

$$(iii) \quad l_{21}u_{12} + u_{22} = a_{22} \quad \text{or} \quad u_{22} = a_{22} - \frac{a_{21}}{a_{11}} a_{12}$$

$$l_{21}u_{13} + u_{23} = a_{23} \quad \text{or} \quad u_{23} = a_{23} - \frac{a_{21}}{a_{11}} a_{13}$$

$$(iv) \quad l_{31}u_{12} + l_{32}u_{22} = a_{32} \quad \text{or} \quad l_{32} = \frac{1}{u_{22}} \left[a_{32} - \frac{a_{31}}{a_{11}} a_{12} \right]$$

$$(v) \quad l_{31}u_{13} + l_{32}u_{23} + u_{33} = a_{33} \quad \text{which gives } u_{33}.$$

Thus we compute the elements of L and U in the following set order :

- (i) First row of U ,
- (ii) First column of L ,
- (iii) Second row of U ,
- (iv) Second column of L ,
- (v) Third row of U .

This procedure can easily be generalised.

Obs. This method is superior to Gauss elimination method and is often used for the solution of linear systems and for finding the inverse of a matrix. Among the direct methods, Factorization method is also preferred as the software for computers.

Example 28.17. Apply factorization method to solve the equations :

$$3x + 2y + 7z = 4; 2x + 3y + z = 5; 3x + 4y + z = 7.$$

(Madras, 2000 S)

$$\text{Solution. Let } \begin{bmatrix} 1 & 0 & 0 \\ l_{21} & 1 & 0 \\ l_{31} & l_{32} & 1 \end{bmatrix} \begin{bmatrix} u_{11} & u_{12} & u_{13} \\ 0 & u_{22} & u_{23} \\ 0 & 0 & u_{33} \end{bmatrix} = \begin{bmatrix} 3 & 2 & 7 \\ 2 & 3 & 1 \\ 3 & 4 & 1 \end{bmatrix} \quad (\text{i.e. } A),$$

so that

$$(i) \quad u_{11} = 3, \quad u_{12} = 2, \quad u_{13} = 7.$$

$$(ii) \quad l_{21}u_{11} = 2, \quad \therefore l_{21} = 2/3$$

$$l_{31}u_{11} = 3, \quad \therefore l_{31} = 1.$$

$$(iii) \quad l_{21}u_{12} + u_{22} = 3, \quad \therefore u_{22} = 5/3,$$

$$l_{21}u_{13} + u_{23} = 1, \quad \therefore u_{23} = -11/3.$$

$$(iv) \quad l_{31}u_{12} + l_{32}u_{22} = 4, \quad \therefore l_{32} = 6/5.$$

$$(v) \quad l_{31}u_{13} + l_{32}u_{23} + u_{33} = 1$$

$$\therefore u_{33} = -8/5$$

$$\text{Thus } A = \begin{bmatrix} 1 & 0 & 0 \\ 2/3 & 1 & 0 \\ 1 & 6/5 & 1 \end{bmatrix} \begin{bmatrix} 3 & 2 & 7 \\ 0 & 5/3 & -11/3 \\ 0 & 0 & -8/5 \end{bmatrix}$$

Writing $UX = V$, the given system becomes $\begin{bmatrix} 1 & 0 & 0 \\ 2/3 & 1 & 0 \\ 1 & 6/5 & 1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \end{bmatrix} = \begin{bmatrix} 4 \\ 5 \\ 7 \end{bmatrix}$

Solving this system, we have $v_1 = 4$,

$$\begin{aligned} \frac{2}{3}v_1 + v_2 &= 5 & \text{or} & & v_2 &= \frac{7}{3} \\ v_1 + \frac{6}{5}v_2 + v_3 &= 7 & \text{or} & & v_3 &= \frac{1}{5} \end{aligned}$$

Hence the original system becomes

$$\begin{bmatrix} 3 & 2 & 7 \\ 0 & 5/3 & -11/3 \\ 0 & 0 & -8/5 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \end{bmatrix} = \begin{bmatrix} 4 \\ 7/3 \\ 1/5 \end{bmatrix}$$

$$\text{i.e., } 3x + 2y + 7z = 4 ; \frac{5}{3}y - \frac{11}{3}z = \frac{7}{3} ; -\frac{8}{5}z = \frac{1}{5}$$

By back-substitution, we have $z = -1/8$, $y = 9/8$ and $x = 7/8$.

Example 28.18. Solve the equations of Example 28.14 by factorization method.

$$\text{Solution. Let } \begin{bmatrix} 1 & 0 & 0 & 0 \\ l_{21} & 1 & 0 & 0 \\ l_{31} & l_{32} & 1 & 0 \\ l_{41} & l_{42} & l_{43} & 1 \end{bmatrix} \begin{bmatrix} u_{11} & u_{12} & u_{13} & u_{14} \\ 0 & u_{22} & u_{23} & u_{24} \\ 0 & 0 & u_{33} & u_{34} \\ 0 & 0 & 0 & u_{44} \end{bmatrix} = \begin{bmatrix} 10 & -7 & 3 & 5 \\ -6 & 8 & -1 & -4 \\ 3 & 1 & 4 & 11 \\ 5 & -9 & -2 & 4 \end{bmatrix} \quad (\text{i.e., } A)$$

so that

(i) R_1 of U : $u_{11} = 10$, $u_{12} = -7$, $u_{13} = 3$, $u_{14} = 5$

(ii) C_1 of L : $l_{21} = -0.6$, $l_{31} = 0.3$, $l_{41} = 0.5$

(iii) R_2 of U : $u_{22} = 3.8$, $u_{23} = 0.8$, $u_{24} = -1$

(iv) C_2 of L : $l_{32} = 0.81579$, $l_{42} = -1.44737$

(v) R_3 of U : $u_{33} = 2.44737$, $u_{34} = 10.31579$

(vi) C_3 of L : $l_{43} = -0.95699$

(vii) R_4 of U : $u_{44} = 9.92474$

Thus

$$A = \begin{bmatrix} 1 & 0 & 0 & 0 \\ -0.6 & 1 & 0 & 0 \\ 0.3 & 0.81579 & 1 & 0 \\ 0.5 & -1.44737 & -0.95699 & 1 \end{bmatrix} \begin{bmatrix} 10 & -7 & 3 & 5 \\ 0 & 3.8 & 0.8 & -1 \\ 0 & 0 & 2.44737 & 10.31579 \\ 0 & 0 & 0 & 9.92474 \end{bmatrix}$$

Writing $UX = V$, the given system becomes

$$\begin{bmatrix} 1 & 0 & 0 & 0 \\ -0.6 & 1 & 0 & 0 \\ 0.3 & 0.81579 & 1 & 0 \\ 0.5 & -1.44737 & -0.95699 & 1 \end{bmatrix} \begin{bmatrix} v_1 \\ v_2 \\ v_3 \\ v_4 \end{bmatrix} = \begin{bmatrix} 6 \\ 5 \\ 2 \\ 7 \end{bmatrix}$$

Solving this system, we get

$$v_1 = 6, v_2 = 8.6, v_3 = -6.81579, v_4 = 9.92474.$$

Hence the original system becomes

$$\begin{bmatrix} 10 & -7 & 3 & 5 \\ 0 & 3.8 & 0.8 & -1 \\ 0 & 0 & 2.44737 & 10.31579 \\ 0 & 0 & 0 & 9.92474 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ u \end{bmatrix} = \begin{bmatrix} 6 \\ 8.6 \\ -6.81579 \\ 9.92474 \end{bmatrix}$$

$$\text{i.e., } 10x - 7y + 3z + 5u = 6, \quad 3.8y + 0.8z - u = 8.6,$$

$$2.44737z + 10.31579u = -6.81579, \quad u = 1.$$

By back-substitution, we get $u = 1$, $z = -7$, $y = 4$, $x = 5$.

PROBLEMS 28.3

Solve the following equations by Gauss elimination method :

$$1. \quad 2x + y + z = 10; \quad 3x + 2y + 3z = 18; \quad x + 4y + 9z = 16.$$

(P.T.U., 2005)

$$2. \quad 2x + 2y + z = 12; \quad 3x + 2y + 2z = 8; \quad 5x + 10y - 8z = 10.$$

(W.B.T.U., 2004)

$$3. \quad 2x - y + 3z = 9; \quad x + y + z = 6; \quad x - y + z = 2.$$

(Bhopal, 2009)

$$4. \quad 2x_1 + 4x_2 + x_3 = 3; \quad 3x_1 + 2x_2 - 2x_3 = -2; \quad x_1 - x_2 + x_3 = 6.$$

(Marathwada, 2008)

$$5. \quad 5x_1 + x_2 + x_3 + x_4 = 4; \quad x_1 + 7x_2 + x_3 + x_4 = 12;$$

$$x_1 + x_2 + 6x_3 + x_4 = -5; \quad x_1 + x_2 + x_3 + 4x_4 = -6.$$

Solve the following equations by Gauss-Jordan method :

$$6. \quad 2x + 5y + 7z = 52; \quad 2x + y - z = 0; \quad x + y + z = 9.$$

(V.T.U., 2010)

$$7. \quad 2x - 3y + z = -1; \quad x + 4y + 5z = 25; \quad 3x - 4y + z = 2.$$

(Kerala, 2003)

$$8. \quad x + 3y + 3z = 16; \quad x + 4y + 3z = 18; \quad x + 3y + 4z = 19.$$

(Anna, 2005)

$$9. \quad 2x + y + z = 10; \quad 3x + 2y + 3z = 18; \quad x + 4y + 9z = 16.$$

(V.T.U., 2008)

$$10. \quad 2x_1 + x_2 + 5x_3 + x_4 = 5; \quad x_1 + x_2 - 3x_3 + 4x_4 = -1;$$

$$3x_1 + 6x_2 - 2x_3 + x_4 = 8; \quad 2x_1 + 2x_2 + 2x_3 - 3x_4 = 2.$$

Solve the following equations by factorization method :

$$11. \quad 10x + y + z = 12; \quad 2x + 10y + z = 13; \quad 2x + 2y + 10z = 14.$$

(Andhra, 2004; P.T.U., 2003)

$$12. \quad x + 2y + 3z = 14; \quad 2x + 3y + 4z = 20; \quad 3x + 4y + z = 14.$$

$$13. \quad 2x + 3y + z = 9; \quad x + 2y + 3z = 6; \quad 3x + y + 2z = 8.$$

$$14. \quad 2x_1 - x_2 + x_3 = -1; \quad 2x_2 - x_3 + x_4 = 1; \quad x_1 + 2x_3 - x_4 = -1; \quad x_1 + x_2 + 2x_4 = 5.$$

$$15. \quad \text{Find the inverse of the matrix } \begin{bmatrix} 1 & -1 & 1 \\ 1 & 2 & 4 \\ 1 & 2 & 2 \end{bmatrix} \text{ by Crout's method.}$$

28.7 ITERATIVE METHODS OF SOLUTION

The preceding methods of solving simultaneous linear equations are known as *direct methods* as they yield exact solutions. On the other hand, an iterative method is that in which we start from an approximation to the true solution and obtain better and better approximations from a computation cycle repeated as often as may be necessary for achieving a desired accuracy.

Simple iteration methods can be devised for systems in which the coefficients of the leading diagonal are large compared to others. We now explain three such methods :

(1) Jacobi's iteration method*. Consider the equations

$$\left. \begin{array}{l} a_1x + b_1y + c_1z = d_1 \\ a_2x + b_2y + c_2z = d_2 \\ a_3x + b_3y + c_3z = d_3 \end{array} \right\} \quad \dots(1)$$

If a_1, b_2, c_3 are large as compared to other coefficients, then solving these for x, y, z respectively, the system can be written in the form

$$\left. \begin{array}{l} x = k_1 - l_1y - m_1z \\ y = k_2 - l_2x - m_2z \\ z = k_3 - l_3x - m_3y \end{array} \right\} \quad \dots(2)$$

Let us start with the initial approximations x_0, y_0, z_0 (each = 0) for the values of x, y, z . Substituting these on the right, we get the first approximations $x_1 = k_1, y_1 = k_2, z_1 = k_3$.

Substituting these on the right-hand sides of (2), the second approximations are given by

$$x_2 = k_1 - l_1y_1 - m_1z_1$$

$$y_2 = k_2 - l_2x_1 - m_2z_1$$

$$z_2 = k_3 - l_3x_1 - m_3y_1$$

This process is repeated till the difference between two consecutive approximations is negligible.

*See footnote p. 215.

Example 28.19. Solve by Jacobi's iteration method, the equations $10x + y - z = 11.19$, $x + 10y + z = 28.08$, $-x + y + 10z = 35.61$, correct to two decimal places. (Anna, 2007)

Solution. Rewriting the given equations as

$$x = \frac{1}{10}(11.19 - y + z), y = \frac{1}{10}(28.08 - x - z), z = \frac{1}{10}(35.61 + x - y)$$

We start from an approximation, $x_0 = y_0 = z_0 = 0$.

First iteration $x_1 = \frac{11.19}{10} = 1.119, y_1 = \frac{28.08}{10} = 2.808, z_1 = \frac{35.61}{10} = 3.561$

Second iteration $x_2 = \frac{1}{10}(11.19 - y_1 + z_1) = 1.19$

$$y_2 = \frac{1}{10}(28.08 - x_1 - z_1) = 2.24$$

$$z_2 = \frac{1}{10}(35.61 + x_1 - y_1) = 3.39$$

Third iteration $x_3 = \frac{1}{10}(11.19 - y_2 + z_2) = 1.22$

$$y_3 = \frac{1}{10}(28.03 - x_2 - z_2) = 2.35$$

$$z_3 = \frac{1}{10}(35.61 + x_2 - y_2) = 3.45$$

Fourth iteration $x_4 = \frac{1}{10}(11.19 - y_3 + z_3) = 1.23$

$$y_4 = \frac{1}{10}(28.03 - x_3 - z_3) = 2.34$$

$$z_4 = \frac{1}{10}(35.61 + x_3 - y_3) = 3.45$$

Fifth iteration $x_5 = \frac{1}{10}(11.19 - y_4 + z_4) = 1.23$

$$y_5 = \frac{1}{10}(28.03 - x_4 - z_4) = 2.34$$

$$z_5 = \frac{1}{10}(35.61 + x_4 - y_4) = 3.45$$

Hence $x = 1.23$, $y = 2.34$, $z = 3.45$.

Example 28.20. Solve, by Jacobi's iteration method, the equations

$$20x + y - 2z = 17; 3x + 20y - z = -18; 2x - 3y + 20z = 25.$$

(Bhopal, 2009)

Solution. We write the given equations in the form

$$\left. \begin{aligned} x &= \frac{1}{20}(17 - y + 2z) \\ y &= \frac{1}{20}(-18 - 3x + z) \\ z &= \frac{1}{20}(25 - 2x + 3y) \end{aligned} \right\} \quad \dots(i)$$

We start from an approximation $x_0 = y_0 = z_0 = 0$.

Substituting these on the right sides of the equations (i), we get

$$x_1 = \frac{17}{20} = 0.85; y_1 = -\frac{18}{20} = -0.9; z_1 = \frac{25}{20} = 1.25$$

Putting these values on the right of the equations (i), we obtain

$$x_2 = \frac{1}{20}(17 - y_1 + 2z_1) = 1.02$$

$$y_2 = \frac{1}{20} (-18 - 3x_1 + z_1) = -0.965$$

$$z_2 = \frac{1}{20} (25 - 2x_1 + 3y_1) = 1.1515$$

Substituting these values in the right sides of the equations (i), we have

$$x_3 = \frac{1}{20} (17 - y_2 + 2z_2) = 1.0134$$

$$y_3 = \frac{1}{20} (-18 - 3x_2 + z_2) = -0.9954$$

$$z_3 = \frac{1}{20} (25 - 2x_2 + 3y_2) = 1.0032$$

Substituting these values, we get

$$x_4 = \frac{1}{20} (17 - y_3 + 2z_3) = 1.0009$$

$$y_4 = \frac{1}{20} (-18 - 3x_3 + z_3) = -1.0018$$

$$z_4 = \frac{1}{20} (25 - 2x_3 + 3y_3) = 0.9993$$

Putting these values, we have

$$x_5 = \frac{1}{20} (17 - y_4 + 2z_4) = 1.0000$$

$$y_5 = \frac{1}{20} (-18 - 3x_4 + z_4) = -1.0002$$

$$z_5 = \frac{1}{20} (25 - 2x_4 + 3y_4) = 0.9996$$

Again substituting these values, we get

$$x_6 = \frac{1}{20} (17 - y_5 + 2z_5) = 1.0000$$

$$y_6 = \frac{1}{20} (-18 - 3x_5 + z_5) = -1.0000$$

$$z_6 = \frac{1}{20} (25 - 2x_5 + 3y_5) = 1.0000$$

The values in the 5th and 6th iterations being practically the same, we can stop.

Hence the solution is $x = 1, y = -1, z = 1$.

(2) Gauss-Seidel iteration method*. This is a modification of the Jacobi's iteration method. As before, we start with initial approximations x_0, y_0, z_0 (each = 0) for x, y, z respectively. Substituting $y = y_0, z = z_0$ in the first of the equations (2) on page 837, we get

$$x_1 = k_1$$

Then putting $x = x_1, z = z_0$ in the second of the equations (2) on page 837, we have

$$y_1 = k_2 - l_2 x_1 - m_2 z_0$$

Next substituting $x = x_1, y = y_1$ in the third of the equations (2) on page 837, we obtain

$$z_1 = k_3 - l_3 x_1 - m_3 y_1$$

and so on, i.e., as soon as new approximation for an unknown is found, it is immediately used in the next step.

This process of iteration is continued till convergency to the desired degree of accuracy is obtained.

Obs 1. Since the most recent approximation of the unknowns are used while proceeding to the next step, the convergence in the Gauss-Seidel method is faster than in Jacobi's method.

Obs 2. Gauss-Seidel method converges if in each equation, the absolute value of the largest coefficient is greater than the sum of the absolute values of the remaining coefficients.

*See footnote p. 37. After Philipp Ludwig Von Seidel (1821–1896) who also suggested a similar method.

Example 28.21. Apply Gauss-Seidel iteration method to solve the equations of Ex. 28.20.

(V.T.U., 2011; Rohtak, 2005; Madras, 2003)

Solution. We write the given equation in the form

$$x = \frac{1}{20} (17 - y + 2z); y = \frac{1}{20} (-18 - 3x + z); z = \frac{1}{20} (25 - 2x + 3y) \quad \dots(i)$$

We start from the approximation $x_0 = y_0 = z_0 = 0$. Substituting $y = y_0$, $z = z_0$ in the right side of the first of equations (i), we get

$$x_1 = \frac{1}{20} (17 - y_0 + 2z_0) = 0.8500$$

Putting $x = x_1$, $z = z_0$ in the second of the equations (i), we have

$$y_1 = \frac{1}{20} (-18 - 3x_1 + z_0) = -1.0275$$

Putting $x = x_1$, $y = y_1$ in the last of the equations (i), we obtain

$$z_1 = \frac{1}{20} (25 - 2x_1 + 3y_1) = 1.0109$$

For the second iteration, we have

$$x_2 = \frac{1}{20} (17 - y_1 + 2z_1) = 1.0025$$

$$y_2 = \frac{1}{20} (-18 - 3x_2 + z_1) = -0.9998$$

$$z_2 = \frac{1}{20} (25 - 2x_2 + 3y_2) = 0.9998$$

For the third iteration, we get

$$x_3 = \frac{1}{20} (17 - y_2 + 2z_2) = 1.0000$$

$$y_3 = \frac{1}{20} (-18 - 3x_3 + z_2) = -1.0000$$

$$z_3 = \frac{1}{20} (25 - 2x_3 + 3y_3) = 1.0000$$

The values in the 2nd and 3rd iterations being practically the same, we can stop.

Hence the solution is $x = 1$, $y = -1$, $z = 1$.

Example 28.22. Solve the equations :

$$10x_1 - 2x_2 - x_3 - x_4 = 3$$

$$-2x_1 + 10x_2 - x_3 - x_4 = 15$$

$$-x_1 - x_2 + 10x_3 - 2x_4 = 27$$

$$-x_1 - x_2 - 2x_3 + 10x_4 = -9$$

by Gauss-Seidal iteration method.

(Bhopal, 2009; J.N.T.U., 2004)

Solution. Rewriting the given equations as

$$x_1 = 0.3 + 0.2x_2 + 0.1x_3 + 0.1x_4 \quad \dots(i)$$

$$x_2 = 1.5 + 0.2x_1 + 0.1x_3 + 0.1x_4 \quad \dots(ii)$$

$$x_3 = 2.7 + 0.1x_1 + 0.1x_2 + 0.2x_4 \quad \dots(iii)$$

$$x_4 = -0.9 + 0.1x_1 + 0.1x_2 + 0.2x_3 \quad \dots(iv)$$

First iteration

Putting $x_2 = 0$, $x_3 = 0$, $x_4 = 0$ in (i), we get $x_1 = 0.3$

Putting $x_1 = 0.3$, $x_3 = 0$, $x_4 = 0$ in (ii), we obtain $x_2 = 1.56$

Putting $x_1 = 0.3$, $x_2 = 1.56$, $x_4 = 0$ in (iii), we obtain $x_3 = 2.886$

Putting $x_1 = 0.3$, $x_2 = 1.56$, $x_3 = 2.886$ in (iv), we get $x_4 = -0.1368$

Second iteration

Putting $x_2 = 1.56$, $x_3 = 2.886$, $x_4 = -0.1368$ in (i), we obtain

$$x_1 = 0.8869$$

Putting $x_1 = 0.8869$, $x_3 = 2.886$, $x_4 = -0.1368$ in (ii), we obtain

$$x_2 = 1.9523$$

Putting $x_1 = 0.8869$, $x_2 = 1.9523$, $x_4 = -0.1368$ in (iii), we have

$$x_3 = 2.9566$$

Putting $x_1 = 0.8869$, $x_2 = 1.9523$, $x_3 = 2.9566$ in (iv), we get

$$x_4 = -0.0248.$$

Third iteration

Putting $x_2 = 1.9523$, $x_3 = 2.9566$, $x_4 = -0.0248$ in (i), we obtain

$$x_1 = 0.9836$$

Putting $x_1 = 0.9836$, $x_3 = 2.9566$, $x_4 = -0.0248$ in (ii), we obtain

$$x_2 = 1.9899$$

Putting $x_1 = 0.9836$, $x_2 = 1.9899$, $x_4 = -0.0248$ in (iii), we get

$$x_3 = 2.9924$$

Putting $x_1 = 0.9836$, $x_2 = 1.9899$, $x_3 = 2.9924$ in (iv), we get

$$x_4 = -0.0042.$$

Fourth iteration. Proceeding as above

$$x_1 = 0.9968, x_2 = 1.9982, x_3 = 2.9987, x_4 = -0.0008.$$

Fifth iteration is

$$x_1 = 0.9994, x_2 = 1.9997, x_3 = 2.9997, x_4 = -0.0001.$$

Sixth iteration is

$$x_1 = 0.9999, x_2 = 1.9999, x_3 = 2.9999, x_4 = -0.0001.$$

Hence the solution is $x_1 = 1$, $x_2 = 2$, $x_3 = 3$, $x_4 = 0$.

(3) Relaxation method*. Consider the equations

$$a_1x + b_1y + c_1z = d_1; a_2x + b_2y + c_2z = d_2; a_3x + b_3y + c_3z = d_3$$

We define the residuals R_x , R_y , R_z by the relations

$$R_x = d_1 - a_1x - b_1y - c_1z; R_y = d_2 - a_2x - b_2y - c_2z; R_z = d_3 - a_3x - b_3y - c_3z \quad \dots(1)$$

To start with we assume $x = y = z = 0$ and calculate the initial residuals. Then the residuals are reduced step by step by giving increments to the variables. For this purpose, we construct the following *operation table*:

	δR_x	δR_y	δR_z
$\delta x = 1$	$-a_1$	$-a_2$	$-a_3$
$\delta y = 1$	$-b_1$	$-b_2$	$-b_3$
$\delta z = 1$	$-c_1$	$-c_2$	$-c_3$

We note from the equations (1) that if x is increased by 1 (keeping y and z constant), R_x , R_y and R_z decrease by a_1 , a_2 , a_3 respectively. This is shown in the above table alongwith the effects on the residuals when y and z are given unit increments. (The table is the transpose of the coefficient matrix).

At each step, the numerically largest residual is reduced to almost zero. To reduce a particular residual, the value of the corresponding variable is changed ; e.g., to reduce R_x by p , x should be increased by p/a_1 .

When all the residuals have been reduced to almost zero, the increments in x , y , z are added separately to give the desired solution.

Obs. As a check, the computed values of x , y , z are substituted in (1) and the residuals are calculated. If these residuals are not all negligible, then there is some mistake and the entire process should be rechecked.

Example 28.23. Solve, by Relaxation method, the equations :

$$9x - 2y + z = 50, x + 5y - 3z = 18, -2x + 2y + 7z = 19.$$

(Madras, 2000 S)

*This method was originally developed by R.V. Southwell in 1935, for application to structural engineering problems.

Solution. The residuals are given by

$$R_x = 50 - 9x + 2y - z; R_y = 18 - x - 5y + 3z; R_z = 19 + 2x - 2y - 7z$$

The operations table is

	δR_x	δR_y	δR_z
$\delta x = 1$	-9	-1	2
$\delta y = 1$	2	-5	-2
$\delta z = 1$	-1	3	-7

The relaxation table is

	R_x	R_y	R_z	
$x = y = z = 0$	50	-18	19	...(i)
$\delta x = 5$	5	13	29	...(ii)
$\delta z = 4$	1	25	1	...(iii)
$\delta y = 5$	11	0	-9	...(iv)
$\delta x = 1$	2	-1	-7	...(v)
$\delta z = -1$	3	-4	0	...(vi)
$\delta y = -0.8$	1.4	0	1.6	...(vii)
$\delta z = 0.23$	1.17	0.69	-0.09	...(viii)
$\delta x = 0.13$	0	0.56	0.17	...(ix)
$\delta y = 0.112$	0.224	0	-0.054	...(x)

$$\Sigma \delta x = 6.13, \Sigma \delta y = 4.31, \Sigma \delta z = 3.23$$

Thus

$$x = 6.13, y = 4.31, z = 3.23.$$

[Explanation. In (i), the largest residual is 50. To reduce it, we give an increment $\delta x = 5$ and the resulting residuals are shown in (ii). Of these $R_y = 29$ is the largest and we give an increment $\delta z = 4$ to get the results in (iii). In (vi), $R_z = -4$ is the (numerically) largest and we give an increment $\delta y = -4/5 = -0.8$ to obtain the results in (vii). Similarly the other steps have been carried out.]

Example 28.24. Solve by Relaxation method, the equations :

$$10x - 2y - 3z = 205; -2x + 10y - 2z = 154; -2x - y + 10z = 120. \text{ (V.T.U., 2011 S ; Rohtak, 2005)}$$

Solution. The residuals are given by

$$R_x = 205 - 10x + 2y + 3z; R_y = 154 + 2x - 10y + 2z; R_z = 120 + 2x + y - 10z.$$

The operations table is

	δR_x	δR_y	δR_z
$\delta x = 1$	-10	2	2
$\delta y = 1$	2	-10	-1
$\delta z = 1$	3	2	-10

The relaxation table is :

	R_x	R_y	R_z
$x = y = z = 0$	205	154	120
$\delta x = 20$	5	194	160
$\delta y = 19$	43	4	179
$\delta z = 18$	97	40	-1
$\delta x = 10$	-3	60	19
$\delta y = 8$	9	0	25
$\delta z = 2$	15	4	5
$\delta x = 2$	-5	8	9
$\delta z = 1$	-2	10	-1
$\delta y = 1$	0	0	0

$$\Sigma \delta x = 32, \Sigma y = 26, \Sigma z = 21.$$

Hence

$$x = 32, y = 26, z = 21.$$

PROBLEMS 28.4

1. Solve by Jacobi's method, the equations : $5x - y + z = 10$; $2x + 4y = 12$; $x + y + 5z = -1$. Start with the solution $(2, 3, 0)$.

2. Solve the equations $27x + 6y - z = 85$; $x + y + 54z = 110$; $6x + 15y + 2z = 72$.
 by (a) Jacobi's method (b) Gauss-Seidel method.

(Anna, 2006)

Solve the following equations by Gauss-Seidel method :

3. $2x + y + 6z = 9$; $8x + 3y + 2z = 13$; $x + 5y + z = 7$.

(Mumbai, 2009)

4. $28x + 4y - z = 32$; $x + 3y + 10z = 24$; $2x + 17y + 4z = 35$.

(V.T.U., MCA, 2007)

5. $10x + y + z = 12$; $2x + 10y + z = 13$; $2x + 2y + 10z = 104$.

(Hazaribagh, 2009)

6. $83x + 11y - 4z = 95$; $7x + 52y + 13z = 104$; $3x + 8y + 29z = 71$.

(Mumbai, 2004)

7. $3x_1 - 0.1x_2 - 0.2x_3 = 7.85$; $0.1x_1 + 7x_2 - 0.3x_3 = -19.3$; $0.3x_1 - 0.2x_2 + 10x_3 = 71.4$.

8. $1.2x + 2.1y + 4.2z = 9.9$; $5.3x + 6.1y + 4.7z = 21.6$; $9.2x + 8.3y + z = 15.2$.

9.
$$\begin{bmatrix} 2 & -1 & 0 & 0 \\ -1 & 2 & -1 & 0 \\ 0 & -1 & 2 & -1 \\ 0 & 0 & -1 & 2 \end{bmatrix} \begin{bmatrix} x \\ y \\ z \\ u \end{bmatrix} = \begin{bmatrix} 0 \\ 0 \\ 0 \\ 5 \end{bmatrix}$$

Solve by Relaxation method, the following sets of equations :

10. $3x + 9y - 2z = 11$; $4x + 2y + 13z = 24$; $4x - 4y + 3z = -8$.

(Bhopal, 2002)

11. $10x - 2y - 2z = 6$; $-x + 10y - 2z = 7$; $-x - y + 10z = 8$.

12. $-9x + 3y + 4z + 100 = 0$; $x - 7y + 3z + 80 = 0$; $2x + 3y - 5z + 60 = 0$.

13. $54x + y + z = 110$; $2x + 15y + 6z = 72$; $-x + 6y + 27z = 85$.

(Bhopal, 2003)

28.8 SOLUTION OF NON-LINEAR SIMULTANEOUS EQUATIONS—NEWTON-RAPHSON METHOD

Consider the equations

$$f(x, y) = 0, g(x, y) = 0 \quad \dots(1)$$

If an initial approximation (x_0, y_0) to a solution has been found by graphical method or otherwise, then a better approximation (x_1, y_1) can be obtained as follows :

Let $x_1 = x_0 + h, y_1 = y_0 + k$, so that $f(x_0 + h, y_0 + k) = 0, g(x_0 + h, y_0 + k) = 0$...(2)

Expanding each of the functions in (2) by Taylor's series to first degree terms, we get approximately

$$\left. \begin{aligned} f_0 + h \frac{\partial f}{\partial x_0} + k \frac{\partial f}{\partial y_0} &= 0 \\ g_0 + h \frac{\partial g}{\partial x_0} + k \frac{\partial g}{\partial y_0} &= 0 \end{aligned} \right\} \quad \dots(3)$$

where $f_0 = f(x_0, y_0), \frac{\partial f}{\partial x_0} = \left(\frac{\partial f}{\partial x}\right)_{x_0, y_0}$ etc.

Solving the equations (3) for h and k , we get a new approximation to the root as

$$x_1 = x_0 + h, y_1 = y_0 + k$$

This process is repeated till we get the values to the desired accuracy.

Example 28.25. Solve the system of non-linear equations :

$$x^2 + y = 11, y^2 + x = 7.$$

(Pune, 2000)

Solution. An initial approximation to the solution is obtained from a rough graph of the given equations, as $x_0 = 3.5$ and $y_0 = -1.8$.

We have $f = x^2 + y - 11$ and $g = y^2 + x - 7$ so that

$$\frac{\partial f}{\partial x} = 2x, \frac{\partial f}{\partial y} = 1 \quad \text{and} \quad \frac{\partial g}{\partial x} = 1, \frac{\partial g}{\partial y} = 2y.$$

Then Newton-Raphson's equations (3) above will be

$$7h + k = 0.55, h - 3.6k = 0.26$$

Solving these, we get $h = 0.0855, k = -0.0485$

∴ the better approximation to the root is

$$x_1 = x_0 + h = 3.5855, y_1 = y_0 + k = -1.8485$$

Repeating the above process, replacing (x_0, y_0) by (x_1, y_1) , we obtain $x_2 = 3.5844, y_2 = -1.8482$.

PROBLEMS 28.5

- Solve the equations $x^2 + y = 5 ; y^2 + x = 3$.
- Solve the non-linear equations $x = 2(y+1), y^2 = 3xy - 7$ correct to three decimals.
- Use Newton-Raphson method to solve the equations $x = x^2 + y^2, y = x^2 - y^2$ correct to two decimals, starting with the approximation $(0.8, 0.4)$.
- Solve the non-linear equations $x^2 - y^2 = 4, x^2 + y^2 = 16$ numerically with $x_0 = y_0 = 2.828$ using N.R. method. Carry out two iterations. (V.T.U., MCA, 2007)
- Solve the equations $2x^2 + 3xy + y^2 = 3 ; 4x^2 + 2xy + y^2 = 30$. Correct to three decimal places, using Newton-Raphson method, given that $x_0 = -3$, and $y_0 = 2$.

28.9 DETERMINATION OF EIGEN VALUES BY ITERATION

In § 2.14, we came across equations of the type

$$\left. \begin{array}{l} (a_{11} - \lambda)x_1 + a_{12}x_2 + a_{13}x_3 = 0 \\ a_{21}x_1 + (a_{22} - \lambda)x_2 + a_{23}x_3 = 0 \\ a_{31}x_1 + a_{32}x_2 + (a_{33} - \lambda)x_3 = 0 \end{array} \right\} \quad \dots(1)$$

which in matrix form, may be written as $[A - \lambda I]X = 0$ or $AX = \lambda X$... (2)
where $A = [a_{ij}]$ and X is the column matrix $[x_i]$.

Equation (1) will have a non-trivial solution if the coefficient matrix vanishes e.g.,

$$\begin{vmatrix} a_{11} - \lambda & a_{12} & a_{13} \\ a_{21} & a_{22} - \lambda & a_{23} \\ a_{31} & a_{32} & a_{33} - \lambda \end{vmatrix} = 0$$

This gives a cubic in λ whose roots are *eigen values* of (2) and corresponding to each *eigen value*, we have a non-zero solution $X = [x_1, x_2, x_3]$ which is called an *eigen vector*. Such an equation can ordinarily be solved easily.

In some applications, it is required to compute the numerically largest *eigen value* and the corresponding *eigen vector*. In such cases, the following iterative method is more convenient which is also well-suited for computing machines.

If X_1, X_2, X_3 be the eigen vectors corresponding to the eigen values $\lambda_1, \lambda_2, \lambda_3$, then an arbitrary column vector can be written as $X = k_1 X_1 + k_2 X_2 + k_3 X_3$

Then $AX = k_1 A X_1 + k_2 A X_2 + k_3 A X_3 = k_1 \lambda_1 X_1 + k_2 \lambda_2 X_2 + k_3 \lambda_3 X_3$

Similarly $A^2 X = k_1 \lambda_1^2 X_1 + k_2 \lambda_2^2 X_2 + k_3 \lambda_3^2 X_3$

and $A^r X = k_1 \lambda_1^r X_1 + k_2 \lambda_2^r X_2 + k_3 \lambda_3^r X_3$

If $|\lambda_1| > |\lambda_2| > |\lambda_3|$, then the contribution of the term $k_1 \lambda_1^r X_1$ to the sum on the right increases with r and therefore, every time we multiply a column vector by A , it becomes nearer to the eigen vector X_1 . Then we make the largest component of the resulting column vector unity to avoid the factor k_1 .

Thus we start with a column vector X which is as near the solution as possible and evaluate AX which is written as $\lambda^{(1)} X^{(1)}$ after normalisation. This gives the first approximation $\lambda^{(1)}$ to the eigen value and $X^{(1)}$ to eigen vector. Similarly we evaluate $A X^{(1)} = \lambda^{(2)} X^{(2)}$ which gives the second approximation. We repeat this process till $|X^{(r)} - X^{(r-1)}|$ becomes negligible. Then $\lambda^{(r)}$ will be the largest eigen value of (1) and $X^{(r)}$, the corresponding eigen vector.

This iterative procedure for finding the dominant eigen value of a matrix is known as Rayleigh's power method.*

*After the English mathematician and physicist John William Strut known as Lord Rayleigh (1842–1919) who made important contributions to the theory of waves, elasticity and hydrodynamics. He was professor at Cambridge and London.

Example 28.26. Determine the largest eigen value and the corresponding eigen vector of the matrices using the power method :

$$(i) A = \begin{bmatrix} 5 & 4 \\ 1 & 2 \end{bmatrix}$$

$$(ii) A = \begin{bmatrix} 2 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 2 \end{bmatrix}$$

(V.T.U., 2007)

Solution. (i) Let the initial approximation to the eigen vector corresponding to the largest eigen value of A be $X = \begin{bmatrix} 1 \\ 0 \end{bmatrix}$.

Then $AX = \begin{bmatrix} 5 & 4 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \end{bmatrix} = \begin{bmatrix} 5 \\ 1 \end{bmatrix} = 5 \begin{bmatrix} 1 \\ 0.2 \end{bmatrix} = \lambda^{(1)} X^{(1)}$

So the first approximation to the eigen value is $\lambda^{(1)} = 5$ and the corresponding eigen vector is $X^{(1)} = \begin{bmatrix} 1 \\ 0.2 \end{bmatrix}$.

Now $AX^{(1)} = \begin{bmatrix} 5 & 4 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 0.2 \end{bmatrix} = \begin{bmatrix} 5.8 \\ 1.4 \end{bmatrix} = 5.8 \begin{bmatrix} 1 \\ 0.241 \end{bmatrix} = \lambda^{(2)} X^{(2)}$

Thus the second approximation to the eigen-value is $\lambda^{(2)} = 5.8$ and the corresponding eigen-vector is $X^{(2)} = \begin{bmatrix} 1 \\ 0.241 \end{bmatrix}$. repeating the above process, we get

Now $AX^{(2)} = \begin{bmatrix} 5 & 4 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 0.241 \end{bmatrix} = 5.966 \begin{bmatrix} 1 \\ 0.248 \end{bmatrix} = \lambda^{(3)} X^{(3)}$

$$AX^{(3)} = \begin{bmatrix} 5 & 4 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 0.249 \end{bmatrix} = 5.994 \begin{bmatrix} 1 \\ 0.250 \end{bmatrix} = \lambda^{(4)} X^{(4)}$$

$$AX^{(4)} = \begin{bmatrix} 5 & 4 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 0.250 \end{bmatrix} = 5.999 \begin{bmatrix} 1 \\ 0.25 \end{bmatrix} = \lambda^{(5)} X^{(5)}$$

$$AX^{(5)} = \begin{bmatrix} 5 & 4 \\ 1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 0.25 \end{bmatrix} = 6 \begin{bmatrix} 1 \\ 0.25 \end{bmatrix} = \lambda^{(6)} X^{(6)}$$

Clearly $\lambda^{(5)} = \lambda^{(6)}$ and $X^{(5)} = X^{(6)}$ upto 3 decimal places. Hence the largest eigen-value is 6 and the corresponding eigen vector is $\begin{bmatrix} 1 \\ 0.25 \end{bmatrix}$.

(ii) Let the initial approximation to the required eigen vector be $X = [1, 0, 0]'$.

Then $AX = \begin{bmatrix} 2 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ 0 \\ 0 \end{bmatrix} = \begin{bmatrix} 2 \\ -1 \\ 0 \end{bmatrix} = 2 \begin{bmatrix} 1 \\ -0.5 \\ 0 \end{bmatrix} = \lambda^{(1)} X^{(1)}$

So the first approximation to the eigen value is $\lambda^{(1)} = 2$ and the corresponding eigen vector $X^{(1)} = [1, -0.5, 0]'$.

Hence $AX^{(1)} = \begin{bmatrix} 2 & -1 & 0 \\ -1 & 2 & -1 \\ 0 & -1 & 2 \end{bmatrix} \begin{bmatrix} 1 \\ -0.5 \\ 0 \end{bmatrix} = \begin{bmatrix} 2.5 \\ -2 \\ 0.5 \end{bmatrix} = 2.5 \begin{bmatrix} 1 \\ -0.8 \\ 0.2 \end{bmatrix} = \lambda^{(2)} X^{(2)}$

Repeating the above process, we get

$$AX^{(2)} = 2.8 \begin{bmatrix} 1 \\ -1 \\ 0.43 \end{bmatrix} = \lambda^{(3)} X^{(3)} ; AX^{(3)} = 3.43 \begin{bmatrix} 0.87 \\ -1 \\ 0.54 \end{bmatrix} = \lambda^{(4)} X^{(4)}$$

$$AX^{(4)} = 3.41 \begin{bmatrix} 0.80 \\ -1 \\ 0.61 \end{bmatrix} = \lambda^{(5)} X^{(5)} ; AX^{(5)} = 3.41 \begin{bmatrix} 0.76 \\ -1 \\ 0.65 \end{bmatrix} = \lambda^{(6)} X^{(6)} ; AX^{(6)} = 3.41 \begin{bmatrix} 0.74 \\ -1 \\ 0.67 \end{bmatrix} = \lambda^{(7)} X^{(7)}$$

Clearly $\lambda^{(6)} = \lambda^{(7)}$ and $X^{(6)} = X^{(7)}$ approximately.

Hence the largest eigen value is 3.41 and the corresponding eigen vector is $[0.74, -1, 0.67]'$.

PROBLEMS 28.6

1. Find by power method, the larger eigen-value of the matrices :

(a) $\begin{bmatrix} 1 & 2 \\ 3 & 4 \end{bmatrix}$ (Anna, 2005)

(b) $\begin{bmatrix} 4 & 1 \\ 1 & 3 \end{bmatrix}$

2. Obtain the largest eigen-value and the corresponding eigen-vector for the equations

$$(2 - \lambda)x_1 - x_2 = 0 ; -x_1 + (2 - \lambda)x_2 - x_3 = 0 ; -x_2 + (2 - \lambda)x_3 = 0$$

by Rayleigh Quotient method.

3. Find the dominant eigen value and the corresponding eigen vector of the following matrices using the power method :

(a) $\begin{bmatrix} 4 & 1 & -1 \\ 2 & 3 & -1 \\ -2 & 1 & 5 \end{bmatrix}$ (V.T.U., 2011)

(b) $\begin{bmatrix} 6 & -2 & 2 \\ -2 & 3 & -1 \\ 2 & -1 & 3 \end{bmatrix}$

(V.T.U., 2011 S)

4. Find the largest eigen-value and the corresponding eigen-vector of the matrices :

(a) $\begin{bmatrix} 1 & -3 & 2 \\ 4 & 4 & -1 \\ 6 & 3 & 5 \end{bmatrix}$ (Anna, 2005)

(b) $\begin{bmatrix} 25 & 1 & 2 \\ 1 & 3 & 0 \\ 2 & 0 & -4 \end{bmatrix}$

(V.T.U., 2008)

(c) $\begin{bmatrix} 1 & 3 & -1 \\ 3 & 2 & 4 \\ -1 & 4 & 10 \end{bmatrix}$ with initial approximation $[1, 1, 0]^T$.

(Madras, 2006)

28.10 OBJECTIVE TYPE OF QUESTIONS

PROBLEMS 28.7

Fill up the blanks or select the correct answer to each of the following problems :

- Out of Regula-falsi method and Newton-Raphson method, the rate of convergence is faster for
- If x_n is the n th iterate, then the Newton-Raphson formula is

Finite Differences and Interpolation

1. Finite differences. 2. Differences of a polynomial. 3. Factorial notation. 4. Relations between the operators. 5. To find one or more missing terms. 6. Newton's interpolation formulae. 7. Central difference interpolation formulae—Gauss's interpolation formulae; Stirling's formula; Bessel's formula; Everett's formula. 8. Choice of an interpolation formula. 9. Interpolation with unequal intervals. 10. Lagrange's formula. 11. Divided differences. 12. Newton's divided difference formula. 13. Inverse interpolation. 14. Objective Type of Questions.

29.1 FINITE DIFFERENCES

Suppose we are given the following values of $y = f(x)$ for a set of values of x :

$x :$	x_0	x_1	$x_2 \dots x_n$
$y :$	y_0	y_1	$y_2 \dots y_n$

Then the process of finding the values of y corresponding to any value of $x = x_i$ between x_0 and x_n is called *interpolation*. Thus *interpolation* is the technique of estimating the value of a function for any intermediate value of the independent variable while the process of computing the value of the function outside the given range is called *extrapolation*. The study of the interpolation is based on the concept of differences of a function which we proceed to discuss. For a detailed study, the reader should refer to author's book 'Numerical Methods in Engineering and Science'.

Suppose that the function $y = f(x)$ is tabulated for the equally spaced values $x = x_0, x_0 + h, x_0 + 2h, \dots, x_0 + nh$ giving $y = y_0, y_1, y_2, \dots, y_n$. To determine the values of $f(x)$ or $f'(x)$ for some intermediate values of x , the following three types of differences are found useful:

(1) **Forward differences.** The differences $y_1 - y_0, y_2 - y_1, \dots, y_n - y_{n-1}$ when denoted by $\Delta y_0, \Delta y_1, \dots, \Delta y_{n-1}$ respectively are called the *first forward differences* where Δ is the *forward difference operator*. Thus the first forward differences are $\Delta y_r = y_{r+1} - y_r$.

Similarly, the second forward differences are defined by

$$\Delta^2 y_r = \Delta y_{r+1} - \Delta y_r$$

$$\text{In general, } \Delta^p y_r = \Delta^{p-1} y_{r+1} - \Delta^{p-1} y_r$$

defines the *pth forward differences*.

These differences are systematically set out as follows in what is called a *Forward Difference Table*.

In a difference table, x is called the *argument* and y the *function* or the *entry*. y_0 , the first entry is called the *leading term* and $\Delta y_0, \Delta^2 y_0, \Delta^3 y_0$ etc. are called the *leading differences*.

Obs. Any higher order forward difference can be expressed in terms of the entries.

$$\text{We have: } \Delta^2 y_0 = \Delta y_1 - \Delta y_0 = (y_2 - y_1) - (y_1 - y_0) = y_2 - 2y_1 + y_0$$

$$\Delta^3 y_0 = \Delta^2 y_1 - \Delta^2 y_0 = (y_3 - 2y_2 + y_1) - (y_2 - 2y_1 + y_0) = y_3 - 3y_2 + 3y_1 - y_0$$

$$\Delta^4 y_0 = \Delta^3 y_1 - \Delta^3 y_0 = (y_4 - 3y_3 + 3y_2 - y_1) - (y_3 - 3y_2 + 3y_1 - y_0) = y_4 - 4y_3 + 6y_2 - 4y_1 + y_0$$

The coefficients occurring on the right hand side being the binomial coefficient, we have in general,

$$\Delta^p y_0 = y_n - {}^p C_1 y_{n-1} + {}^p C_2 y_{n-2} - \dots + (-1)^p y_0$$

Forward Difference Table

Value of x	Value of y	1st. diff.	2nd diff.	3rd diff.	4th diff.	5th diff.
x_0	y_0					
$x_0 + h$	y_1	Δy_0	$\Delta^2 y_0$	$\Delta^3 y_0$		
$x_0 + 2h$	y_2	Δy_1	$\Delta^2 y_1$	$\Delta^3 y_1$	$\Delta^4 y_0$	
$x_0 + 3h$	y_3	Δy_2	$\Delta^2 y_2$	$\Delta^3 y_2$	$\Delta^4 y_1$	$\Delta^5 y_0$
$x_0 + 4h$	y_4	Δy_3	$\Delta^2 y_3$			
$x_0 + 5h$	y_5	Δy_4				

(2) **Backward differences.** The differences $y_1 - y_0, y_2 - y_1, \dots, y_n - y_{n-1}$ when denoted by $\nabla y_1, \nabla y_2, \dots, \nabla y_n$ respectively, are called the *first backward differences* where ∇ is the *backward difference operator*. Similarly we define higher order backward differences. Thus we have

$$\begin{aligned}\nabla y_r &= y_r - y_{r-1}, \quad \nabla^2 y_r = \nabla y_r - \nabla y_{r-1}, \\ \nabla^3 y_r &= \nabla^2 y_r - \nabla^2 y_{r-1} \text{ etc.}\end{aligned}$$

The differences are exhibited in the following :

Backward Difference Table

Value of x	Value of y	1st. diff.	2nd diff.	3rd diff.	4th diff.	5th diff.
x_0	y_0					
$x_0 + h$	y_1	∇y_1	$\nabla^2 y_2$	$\nabla^3 y_3$		
$x_0 + 2h$	y_2	∇y_2	$\nabla^2 y_3$	$\nabla^3 y_4$	$\nabla^4 y_4$	
$x_0 + 3h$	y_3	∇y_3	$\nabla^2 y_4$	$\nabla^3 y_5$	$\nabla^4 y_5$	
$x_0 + 4h$	y_4	∇y_4	$\nabla^2 y_5$			
$x_0 + 5h$	y_5	∇y_5				

(3) **Central differences.** Sometimes it is convenient to employ another system of differences known as *central differences*. In this system, the *central difference operator* δ is defined by the relations :

$$y_1 - y_0 = \delta y_{1/2}, \quad y_2 - y_1 = \delta y_{3/2}, \dots, \quad y_n - y_{n-1} = \delta y_{n-1/2}$$

Similarly, higher order central differences are defined as

$$\delta y_{3/2} - \delta y_{1/2} = \delta^2 y_1, \quad \delta y_{5/2} - \delta y_{3/2} = \delta^2 y_2, \dots,$$

$$\delta^3 y_2 - \delta^2 y_1 = \delta^3 y_{3/2} \text{ and so on.}$$

These differences are shown in the following :

Central Difference Table

Value of x	Value of y	1st. diff.	2nd diff.	3rd diff.	4th diff.	5th diff.
x_0	y_0					
$x_0 + h$	y_1	$\delta y_{1/2}$	$\delta^2 y_1$	$\delta^3 y_{3/2}$		
$x_0 + 2h$	y_2	$\delta y_{3/2}$	$\delta^2 y_2$	$\delta^3 y_{5/2}$	$\delta^4 y_2$	
$x_0 + 3h$	y_3	$\delta y_{5/2}$	$\delta^2 y_3$	$\delta^3 y_{7/2}$	$\delta^4 y_3$	
$x_0 + 4h$	y_4	$\delta y_{7/2}$	$\delta^2 y_4$			
$x_0 + 5h$	y_5	$\delta y_{9/2}$				

We see from this table that the central differences on the same horizontal line have the same suffix. Also the differences of odd order are known only for half values of the suffix and those of even order for only integral values of the suffix.

It is often required to find the mean of adjacent values in the same column of differences. We denote this mean by μ . Thus

$$\mu \delta y_1 = \frac{1}{2}(\delta y_{1/2} + \delta y_{3/2}), \mu \delta^2 y_{3/2} = \frac{1}{2}(\delta^2 y_1 + \delta^2 y_2) \text{ etc.}$$

Obs. The reader should note that it is only the notation which changes and not the differences.

$$y_1 - y_0 = \Delta y_0 = \nabla y_1 = \delta y_{1/2}$$

Of all the interpolation formulae, those involving central differences are most useful in practice as the coefficients in such formulae decrease much more rapidly.

Example 29.1. Evaluate (i) $\Delta \tan^{-1} x$ (ii) $\Delta(e^x \log 2x)$ (iii) $\Delta(x^2 / \cos 2x)$ (iv) $\Delta^2 \cos 2x$.

(P.T.U., 2001)

Solution. (i) $\Delta \tan^{-1} x = \tan^{-1}(x+h) - \tan^{-1} x$

$$= \tan^{-1} \left\{ \frac{x+h-x}{1+(x+h)x} \right\} = \tan^{-1} \left\{ \frac{h}{1+hx+x^2} \right\}$$

(ii) $\Delta(e^x \log 2x) = e^{x+h} \log 2(x+h) - e^x \log 2x$

$$= e^{x+h} \log 2(x+h) - e^{x+h} \log 2x + e^{x+h} \log 2x - e^x \log 2x$$

$$= e^{x+h} \log \frac{x+h}{x} + (e^{x+h} - e^x) \log 2x$$

$$= e^h \left[e^x \log \left(1 + \frac{h}{x} \right) + (e^h - 1) \log 2x \right]$$

$$(iii) \Delta \left(\frac{x^2}{\cos 2x} \right) = \frac{(x+h)^2}{\cos 2(x+h)} - \frac{x^2}{\cos 2x} = \frac{(x+h)^2 \cos 2x - x^2 \cos 2(x+h)}{\cos 2(x+h) \cos 2x}$$

$$= \frac{[(x+h)^2 - x^2] \cos 2x + x^2 [\cos 2x - \cos 2(x+h)]}{\cos 2(x+h) \cos 2x}$$

$$= \frac{(2hx + h^2) \cos 2x + 2x^2 \sin(h) \sin(2x+h)}{\cos 2(x+h) \cos 2x}$$

(iv) $\Delta^2 \cos 2x = \Delta[\cos 2(x+h) - \cos 2x]$

$$= \Delta \cos 2(x+h) - \Delta \cos 2x$$

$$= [\cos 2(x+2h) - \cos 2(x+h)] - [\cos 2(x+h) - \cos 2x]$$

$$= -2 \sin(2x+3h) \sin h + 2 \sin(2x+h) \sin h$$

$$= -2 \sin h [\sin(2x+3h) - \sin(2x+h)]$$

$$= -2 \sin h [2 \cos(2x+2h) \sin h] = -4 \sin^2 h \cos(2x+2h).$$

Example 29.2. Evaluate (i) $\Delta^2 \left(\frac{5x+12}{x^2+5x+16} \right)$ (Mumbai, 2003)

(ii) $\Delta^2(ab^x)$ (iii) $\Delta^n(e^x)$ interval of

differencing being unity.

(Rohtak, 2003)

$$\text{Solution. (i)} \Delta^2 \left(\frac{5x+12}{x^2+5x+16} \right) = \Delta^2 \left(\frac{5x+12}{(x+2)(x+3)} \right) = \Delta^2 \left\{ \frac{2}{x+2} + \frac{3}{x+3} \right\}$$

$$= \Delta \left\{ \Delta \left(\frac{2}{x+2} \right) + \Delta \left(\frac{3}{x+3} \right) \right\} = \Delta \left\{ 2 \left(\frac{1}{x+3} - \frac{1}{x+2} \right) + 3 \left(\frac{1}{x+4} - \frac{1}{x+3} \right) \right\}$$

$$= -2 \Delta \left\{ \frac{1}{(x+2)(x+3)} \right\} - 3 \Delta \left\{ \frac{1}{(x+3)(x+4)} \right\}$$

$$= -2 \left\{ \frac{1}{(x+3)(x+4)} - \frac{1}{(x+2)(x+3)} \right\} - 3 \left\{ \frac{1}{(x+4)(x+5)} - \frac{1}{(x+3)(x+4)} \right\}$$

$$\begin{aligned}
 &= \frac{4}{(x+2)(x+3)(x+4)} + \frac{6}{(x+3)(x+4)(x+5)} = \frac{2(5x+16)}{(x+2)(x+3)(x+4)(x+5)} \\
 (ii) \quad \Delta(ab^x) &= a \Delta(b^x) = a(b^{x+1} - b^x) = ab^x(b-1) \\
 \Delta^2(ab^x) &= \Delta[\Delta(ab^x)] = a(b-1) \Delta(b^x) \\
 &= a(b-1)(b^{x+1} - b^x) = a(b-1)^2 - b^x. \\
 (iii) \quad \Delta e^x &= e^{x+1} - e^x = (e-1)e^x \\
 \Delta^2 e^x &= \Delta(\Delta e^x) = \Delta[(e-1)e^x] \\
 &= (e-1)\Delta e^x = (e-1)(e-1)e^x = (e-1)^2 e^x \\
 \text{Similarly } \Delta^3 e^x &= (e-1)^3 e^x, \Delta^4 e^x = (e-1)^4 e^x, \dots \text{ and } \Delta^n e^x = (e-1)^n e^x.
 \end{aligned}$$

29.2 DIFFERENCES OF A POLYNOMIAL

The n th differences of a polynomial of the n th degree are constant and all higher order differences are zero.

Let the polynomial of the n th degree in x , be

$$\begin{aligned}
 f(x) &= ax^n + bx^{n-1} + cx^{n-2} + \dots + k(x+h) + l \\
 \therefore \Delta f(x) &= f(x+h) - f(x) \\
 &= a[(x+h)^n - x^n] + b[(x+h)^{n-1} - x^{n-1}] + \dots + kh \\
 &= ahx^{n-1} + b'x^{n-2} + c'x^{n-3} + \dots + h'x + l' \quad \dots(1)
 \end{aligned}$$

where b', c', \dots, l' are new constant coefficients.

Thus the first differences of a polynomial of the n th degree is a polynomial of degree $(n-1)$.

$$\begin{aligned}
 \text{Similarly } \Delta^2 f(x) &= \Delta[f(x+h) - f(x)] = \Delta f(x+h) - \Delta f(x) \\
 &= anh[(x+h)^{n-1} - x^{n-1}] + b'[(x+h)^{n-2} - x^{n-2}] + \dots + k'h \\
 &= an(n-1)h^2x^{n-2} + b''x^{n-3} + c''x^{n-4} + \dots + k'', \quad [\text{by (1)}]
 \end{aligned}$$

\therefore the second differences represent a polynomial of degree $(n-2)$.

Continuing this process, for the n th differences we get a polynomial of degree zero i.e.

$$\Delta^n f(x) = an(n-1)(n-2)\dots 1 \cdot h^n = an! h^n \quad \dots(2)$$

which is a constant. Hence the $(n+1)$ th and higher differences of a polynomial of n th degree will be zero.

Obs. The converse of this theorem is also true i.e. if the n th differences of a function tabulated at equally spaced intervals are constant, the function is a polynomial of degree n . This fact is important in numerical analysis as it enables us to approximate a function by a polynomial of n th degree, if its n th order differences become nearly constant.

Example 29.3. Evaluate $\Delta^{10}[(1-ax)(1-bx^2)(1-cx^3)(1-dx^4)]$.

$$\begin{aligned}
 \text{Solution. } \Delta^{10}[(1-ax)(1-bx^2)(1-cx^3)(1-dx^4)] &= \Delta^{10}[abcd x^{10} + (\) x^9 + (\) x^8 + \dots + 1] \\
 &= abcd \Delta^{10}(x^{10}) \quad [\because \Delta^{10}(x^n) = 0 \text{ for } n < 10] \\
 &= abcd (10 !). \quad [\text{by (2) above}]
 \end{aligned}$$

29.3 (1) FACTORIAL NOTATION

A product of the form $x(x-1)(x-2)\dots(x-r+1)$ is denoted by $[x]^r$ and is called a **factorial**.

In particular $[x] = x, [x]^2 = x(x-1)$

$$[x]^3 = x(x-1)(x-2), \text{ etc.}$$

In general $[x]^n = x(x-1)(x-2)\dots(x-n+1)$

In case, the interval of differencing is h , then

$$[x]^n = x(x-h)(x-2h)\dots(x-(n-1)h)$$

which is called a **Factorial polynomial or function**.

The factorial notation is of special utility in the theory of finite differences. It helps in finding the successive differences of a polynomial directly by simple rule of differentiation.

The result of differencing $[x]^r$ is analogous to that of differentiating x^r .

(2) To express a polynomial in the factorial notation

- (i) arrange the coefficients of the powers of x in descending order, replacing missing powers by zeros ;
(ii) using detached coefficients divide by x , $x - 1$, $x - 2$, etc. successively.

Obs. Every polynomial of degree n can be expressed as a factorial polynomial of the same degree and vice versa.

Example 29.4. Express $y = 2x^3 - 3x^2 + 3x - 10$ in a factorial notation and hence show that $\Delta^3y = 12$.

(Bhopal, 2007; P.T.U., 2005)

Solution. First method : Let $y = A[x]^3 + B[x]^2 + C[x] + D$.

Then

	x^3	x^2	x	
1	2	-3	3	$-10 = D$
	-	2	-1	
2	2	-1		$2 = C$
	-	4		
3	2		$3 = B$	
	-			
			$2 = A$	

Hence $y = 2[x]^3 + 3[x]^2 + 2[x] - 10$

$\therefore \Delta y = 2 \times 3[x]^2 + 3 \times 2[x] + 2$

$\Delta^2y = 6 \times 2[x] + 6$

$\Delta^3y = 12$, which shows that the third differences of y are constant, as they should be.

Obs. The coefficient of the highest power of x remains unchanged while transforming a polynomial to factorial notation.

Second method (Direct method) :

Let $y = 2x^3 - 3x^2 + 3x - 10$
 $= 2x(x - 1)(x - 2) + Bx(x - 1) + Cx + D$

Putting $x = 0, -10 = D$

Putting $x = 1, 2 - 3 + 3 - 10 = C + D$

$\therefore C = -8 - D = -8 + 10 = 2$

Putting $x = 2, 16 - 12 + 6 - 10 = 2B + 2C + D$

$\therefore B = \frac{1}{2}(-2C - D) = \frac{1}{2}(-4 + 10) = 3.$

Hence $y = 2x(x - 1)(x - 2) + 3x(x - 1) + 2x - 10 = 2[x]^3 + 3[x]^2 + 2[x] - 10$

$\therefore \Delta y = 2 \times 3[x]^2 + 3 \times 2[x] + 2, \Delta^2y = 6 \times 2[x] + 6, \Delta^3y = 12.$

Example 29.5. Find the missing values in the following table :

x :	45	50	55	60	65
y :	3.0	—	2.0	—	-2.4

(Bhopal, 2007; V.T.U., 2001)

Solution. The difference table is as follows :

x	y	Δy	Δ^2y	Δ^3y
45	$y_0 = 3$	$y_1 - 3$		
50	y_1	$2 - y_1$	$5 - 2y_1$	$3y_1 + y_3 - 9$
55	$y_2 = 2$	$y_3 - 2$	$y_1 + y_3 - 4$	$3.6 - y_1 - 3y_3$
60	y_3	$-2.4 - y_3$	$-0.4 - 2y_3$	
65	$y_4 = -2.4$			

As only three entries y_0, y_2, y_4 are given, the function y can be represented by a second degree polynomial.

$$\therefore \Delta^3 y_0 = 0 \quad \text{and} \quad \Delta^3 y_1 = 0$$

$$\text{i.e.,} \quad 3y_1 + y_3 = 9; \quad y_1 + 3y_3 = 3.6$$

Solving these, we get $y_1 = 2.925, y_3 = 0.225$.

Otherwise : As only three entries $y_0 = 3, y_2 = 2, y_4 = -2.4$ are given, the function y can be represented by a second degree polynomial.

$$\therefore \Delta^3 y_0 = 0 \quad \text{and} \quad \Delta^3 y_1 = 0$$

$$\text{i.e.,} \quad (E - 1)^3 y_0 = 0 \quad \text{and} \quad (E - 1)^3 y_1 = 0$$

$$\text{i.e.,} \quad (E^3 - 3E^2 + 3E - 1)y_0 = 0 \quad \text{and} \quad (E^3 - 3E^2 + 3E - 1)y_1 = 0$$

$$\text{i.e.,} \quad y_3 - 3y_2 + 3y_1 - y_0 = 0$$

$$\text{i.e.,} \quad y_4 - 3y_3 + 3y_2 - y_1 = 0$$

$$\text{i.e.,} \quad y_3 + 3y_1 = 9; 3y_3 + y_1 = 3.6$$

Solving these, we get $y_1 = 2.925, y_3 = 0.225$.

Example 29.6. Assuming that the following values of y belong to a polynomial of degree 4, compute the next three values :

$x :$	0	1	2	3	4	5	6	7
$y :$	1	-1	1	-1	1	—	—	—

Solution. We construct the following difference table from the given data :

x	y	Δy	$\Delta^2 y$	$\Delta^3 y$	$\Delta^4 y$
0	$y_0 = 1$	—	—	—	—
1	$y_1 = -1$	-2	4	—	—8
2	$y_2 = 1$	2	-4	8	16
3	$y_3 = -1$	-2	4	—	16
4	$y_4 = 1$	2	$\Delta^2 y_3$	$\Delta^3 y_2$	16
5	y_5	Δy_4	$\Delta^2 y_4$	$\Delta^3 y_3$	16
6	y_6	Δy_5	$\Delta^2 y_5$	$\Delta^3 y_4$	16
7	y_7	Δy_6	—	—	—

Since the values of y belong to a polynomial of degree 4, the fourth differences must be constant. But $\Delta^4 y = 16$.

\therefore The other fourth order differences must also be 16. Thus

$$\Delta^4 y_1 = 16 = \Delta^3 y_2 - \Delta^3 y_1$$

$$\Delta^3 y_2 = \Delta^3 y_1 + \Delta^4 y_1 = 8 + 16 = 24$$

$$\Delta^2 y_3 = \Delta^2 y_2 + \Delta^3 y_2 = 4 + 24 = 28$$

$$\Delta y_4 = \Delta y_3 + \Delta^2 y_3 = 2 + 28 = 30$$

$$\text{and} \quad y_5 = y_4 + \Delta y_4 = 1 + 30 = 31$$

Similarly starting with $\Delta^4 y_2 = 16$, we get

$$\Delta^3 y_3 = 40, \Delta^2 y_4 = 68, \Delta y_5 = 98, y_6 = 129.$$

Starting with $\Delta^4 y_3 = 16$, we obtain

$$\Delta^3 y_4 = 56, \Delta^2 y_5 = 124, \Delta y_6 = 222, y_7 = 351.$$

PROBLEMS 29.1

1. Construct the table of differences for the data below:

x	0	1	2	3	4
$f(x)$	1.0	1.5	2.2	3.1	4.6

Evaluate $\Delta^3 f(2)$.

2. If $u_0 = 3, u_1 = 12, u_2 = 18, u_3 = 2000, u_4 = 100$, calculate Δu_0 .

3. Show that $\Delta^3 y_i = y_{i+3} - 3y_{i+2} + 3y_{i+1} - y_i$.

4. Form the table of backward differences of the function

$$f(x) = x^3 - 3x^2 - 5x - 7 \text{ for } x = -1, 0, 1, 2, 3, 4, 5.$$

5. Form a table of differences for the function

$$f(x) = x^3 + 5x - 7 \text{ for } x = -1, 0, 1, 2, 3, 4, 5$$

Continue the table to obtain $f(6)$.

6. Extend the following table to two more terms on either side by constructing the difference table:

x :	-2	0.0	0.2	0.4	0.6	0.8	1.0
y :	2.6	3.0	3.4	4.28	7.08	14.2	29.0

7. Show that

$$(i) \Delta \left[\frac{1}{f(x)} \right] = \frac{-\Delta f(x)}{f(x)f(x+1)} ; \quad (\text{Raipur, 2005}) \quad (ii) \Delta \log f(x) = \log \left\{ 1 + \frac{\Delta f(x)}{f(x)} \right\}.$$

8. Evaluate :

$$(i) \Delta(x \times \cos x) \quad (ii) \Delta \tan^{-1} \left(\frac{n-1}{n} \right) \quad (iii) \Delta \left\{ \frac{1}{x(x+4)(x+6)} \right\} \quad (\text{Madras, 2001})$$

$$(iv) \Delta^2 \left(\frac{1}{x^2 + 5x + 6} \right) \quad (\text{P.T.U., 2001})$$

9. Evaluate :

$$(i) \Delta(e^{ax} \log 2x) \quad (ii) \Delta(2^x/x!) \quad (iii) \Delta^n(a^x) \quad (\text{Burdwan, 2003}) \quad (iv) \Delta^n \left(\frac{1}{x} \right).$$

10. If $f(x) = e^{ax+b}$, show that its leading differences form a geometric progression.

(Mumbai, 2003)

11. Prove that

$$(i) y_3 = y_2 + \Delta y_1 + \Delta^2 y_0 + \Delta^3 y_0 \quad (ii) \nabla^2 y_8 = y_8 - 2y_7 + y_6 ; \quad \delta^2 y_5 = y_5 - 2y_3 + y_1.$$

12. Evaluate :

$$(i) \Delta^2 [(1-x)(1-2x)(1-3x)]$$

$$(ii) \Delta^{10} [(1-x)(1-2x^2)(1-3x^3)(1-4x^4)], \text{ if the interval of differencing is } 2.$$

13. Express $x^3 - 2x^2 + x - 1$ into factorial polynomial. Hence show that $\Delta^4 f(x) = 0$

(P.T.U., 2001)

14. Express $u = x^4 - 12x^2 + 24x^2 - 30x + 9$ and its successive differences in factorial notation. Hence show that $\Delta^5 u = 0$.

15. Find the first and second differences of $x^4 - 6x^3 + 11x^2 - 5x + 8$ with $h = 1$. Show that the fourth difference is constant.

16. Obtain the function whose first difference is $2x^3 + 3x^2 - 5x + 4$.

17. Find the first term of the series whose second and subsequent terms are 8, 3, 0, -1, 0.

18. If $u(x)$ and $v(x)$ be two functions of x , prove that

$$(i) \{u(x)v(x)\} = u(x)\Delta v(x) + v(x+1)\Delta u(x), \quad (ii) \Delta \left\{ \frac{u(x)}{v(x)} \right\} = \frac{v(x)\Delta u(x) - u(x)\Delta v(x)}{v(x)v(x+1)}.$$

29.4 (1) OTHER DIFFERENCE OPERATORS

We have already introduced the operators Δ , ∇ and δ . Besides these, there are the operators E and μ , which we define below :

- (i) **Shift operator E** is the operation of increasing the argument x by h so that

$$Ef(x) = f(x+h), E^2 f(x) = f(x+2h), E^3 f(x) = f(x+3h) \text{ etc.}$$

The inverse operator E^{-1} is defined by $E^{-1} f(x) = f(x-h)$

If y_x is the function $f(x)$, then $Ey_x = y_{x+h}$, $E^{-1}y_x = y_{x-h}$, $E^n y_x = y_{x+nh}$,

where n may be any real number.

(ii) **Averaging operator** μ is defined by the equation $\mu y_x = \frac{1}{2}(y_{x+h/2} + y_{x-h/2})$

Obs. In the difference calculus, Δ and E are regarded as the fundamental operators and ∇ , δ , μ can be expressed in terms of these.

(2) **Relations between the operators.** We shall now establish the following identities :

$$(i) \Delta = E - 1$$

$$(ii) \nabla = 1 - E^{-1}$$

$$(iii) \delta = E^{1/2} - E^{-1/2}$$

$$(iv) \mu = \frac{1}{2}(E^{1/2} + E^{-1/2})$$

$$(v) \Delta = EV = VE = \delta E^{1/2}$$

$$(vi) E = e^{hD}$$

Proofs. (i) $\Delta y_x = y_{x+h} - y_x = E y_x - y_x = (E - 1) y_x$

This shows that the operators Δ and E are connected by the symbolic relation

$$\Delta = E - 1 \quad \text{or} \quad E = 1 + \Delta$$

$$(ii) \nabla y_x = y_x - y_{x-h} = y_x - E^{-1} y_x = (1 - E^{-1}) y_x$$

$$\therefore \nabla = 1 - E^{-1} \quad \text{or} \quad E = (1 - \nabla)^{-1}$$

$$(iii) \delta y_x = y_{x+h/2} - y_{x-h/2} = E^{1/2} y_x - E^{-1/2} y_x = (E^{1/2} - E^{-1/2}) y_x$$

$$\therefore \delta = E^{1/2} - E^{-1/2}$$

$$(iv) \mu y_x = \frac{1}{2}(y_{x+h/2} + y_{x-h/2}) = \frac{1}{2}(E^{1/2} y_x + E^{-1/2} y_x) = \frac{1}{2}(E^{1/2} + E^{-1/2}) y_x$$

$$\therefore \mu = \frac{1}{2}(E^{1/2} + E^{-1/2}).$$

$$(v) EV y_x = E(y_x - y_{x-h}) = E y_x - E y_{x-h} = y_{x+h} - y_x = \Delta y_x \quad \therefore EV = \Delta$$

$$\text{Also } \nabla E y_x = \nabla y_{x+h} = y_{x+h} - y_x = \Delta y_x \quad \therefore \nabla E = \Delta$$

$$\delta E^{1/2} y_x = \delta y_{x+h/2} = y_{x+h/2} - y_{x-h/2} = y_{x+h} - y_x = \Delta y_x$$

$$\therefore \delta E^{1/2} = \Delta$$

$$\text{Hence } \Delta = EV = VE = \delta E^{1/2}.$$

$$(vi) Ef(x) = f(x+h)$$

$$= f(x) + hf'(x) + \frac{h^2}{2!} f''(x) + \dots$$

[By Taylor's series]

$$= f(x) + hDf(x) + \frac{h^2}{2!} D^2 f(x) + \dots = \left(1 + hD + \frac{h^2 D^2}{2!} + \frac{h^3 D^3}{3!} + \dots \right) f(x) = e^{hD} f(x)$$

$$\therefore E = e^{hD}$$

$$E = 1 + \Delta = e^{hD}.$$

$$2. \quad D = \frac{1}{h} \log(1 + \Delta) = \frac{1}{h} \left(\Delta - \frac{1}{2} \Delta^2 + \frac{1}{3} \Delta^3 - \dots \right)$$

(Burdwan, 2003)

Note. A table showing the symbolic relations between the various operators is given below for ready reference. To prove such relations between the operators, always express each operator in terms of the fundamental operator E .

(3) Relations between the various operators

In terms of	E	Δ	∇	δ	hD
E		$\Delta + 1$	$(1 + \nabla)^{-1}$	$1 + \frac{1}{2}\delta^2 + \delta\sqrt{(1 + \delta^2)/4}$	e^{hD}
Δ	$E - 1$	—	$(1 - \nabla)^{-1} - 1$	$\frac{1}{2}\delta^2 + \delta\sqrt{(1 + \delta^2)/4}$	$e^{hD} - 1$
∇	$1 - E^{-1}$	$1 - (1 +)^{-1} - 1$	—	$-\frac{1}{2}\delta^2 + \delta\sqrt{(1 + \delta^2)/4}$	$1 - e^{-hD}$
δ	$E^{1/2} - E^{-1/2}$	$\Delta(1 + \Delta)^{-1/2}$	$\nabla(1 - \nabla)^{-1/2}$	—	$2 \sinh(hD/2)$
μ	$\frac{1}{2}(E^{1/2} + E^{-1/2})$	$(1 + \Delta/2)(1 + \Delta)^{-1/2}$	$(1 + \nabla/2)(1 + \nabla)^{-1/2}$	$\sqrt{(1 + \delta^2)/4}$	$\cosh(hD/2)$
hD	$\log E$	$\log(1 + \Delta)$	$\log(1 -)^{-1}$	$2 \sinh^{-1}(\delta/2)$	

Example 29.7. Prove that

$$e^x = \left(\frac{\Delta^2}{E} \right) e^x \cdot \frac{Ee^x}{\Delta^2 e^x}, \text{ the interval of differencing being } h. \quad (\text{Bhopal, 2009})$$

Solution. Since $\left(\frac{\Delta^2}{E} \right) e^x = \Delta^2 \cdot E^{-1} e^x = \Delta^2 e^{x-h} = \Delta^2 e^x \cdot e^{-h} = e^{-h} \Delta^2 e^x$

$$\therefore \text{R.H.S.} = e^{-h} \Delta^2 e^x \cdot \frac{Ee^x}{\Delta^2 e^x} = e^{-h} Ee^x = e^{-h} \cdot e^{x+h} = e^x.$$

Example 29.8. Prove with the usual notations, that

$$(i) hD = \log(1 + \Delta) = -\log(1 - \nabla) = \sinh^{-1}(\mu\delta)$$

$$(ii) (E^{1/2} + E^{-1/2})(1 + \Delta)^{1/2} = 2 + \Delta$$

(Rohtak, 2005)

(Bhopal, 2009; U.P.T.U., 2009)

$$(iii) \Delta = \frac{1}{2}\delta^2 + \delta\sqrt{(1 + \delta^2)/4}$$

$$(iv) \Delta^3 y_2 = \nabla^3 y_5$$

Solution. (i) We know that $e^{hD} = E = 1 + \Delta \therefore hD = \log(1 + \Delta)$

$$\text{Also } hD = \log E = -\log(E^{-1}) = -\log(1 - \nabla)$$

$$\therefore E^{-1} = 1 - \nabla$$

We have proved that $\mu = \frac{1}{2}(E^{1/2} + E^{-1/2})$ and $\delta = E^{1/2} - E^{-1/2}$

$$\therefore \mu\delta = \frac{1}{2}(E^{1/2} + E^{-1/2})(E^{1/2} - E^{-1/2}) = \frac{1}{2}(E - E^{-1}) = \frac{1}{2}(e^{hD} - e^{-hD}) = \sinh(hD)$$

i.e.

$$hD = \sinh^{-1}(\mu\delta).$$

$$\text{Hence } hD = \log(1 + \Delta) = -\log(1 - \nabla) = \sinh^{-1}(\mu\delta)$$

$$(ii) (E^{1/2} + E^{-1/2})(1 + \Delta)^{1/2} = (E^{1/2} + E^{-1/2})E^{1/2} = E + 1 = 1 + \Delta + 1 = 2 + \Delta.$$

$$(iii) \frac{1}{2}\delta^2 + \delta\sqrt{(1 + \delta^2)/4}$$

$$\begin{aligned} &= \frac{1}{2}(E^{1/2} - E^{-1/2})^2 + (E^{1/2} - E^{-1/2})\sqrt{[1 + (E^{1/2} - E^{-1/2})^2]/4} \\ &= \frac{1}{2}(E + E^{-1} - 2) + (E^{1/2} - E^{-1/2})\sqrt{[(E + E^{-1} + 2)/4]} \\ &= \frac{1}{2}(E + E^{-1} - 2) + \frac{1}{2}(E^{1/2} - E^{-1/2})(E^{1/2} + E^{-1/2}) \\ &= \frac{1}{2}[(E + E^{-1} - 2) + (E - E^{-1})] = \frac{1}{2}(2E - 2) = E - 1 = \Delta. \end{aligned}$$

$$(iv) \Delta^3 y_2 = (E - 1)^3 y_2 = (E^3 - 3E^2 + 3E - 1)y_2 = y_5 - 3y_4 + 3y_3 - y_2 \quad [\because \Delta = E - 1] \quad \dots(1)$$

$$\begin{aligned} \nabla^3 y_5 &= (1 - E^{-1})^3 y_5 = (1 - 3E^{-1} + 3E^{-2} - E^{-3})y_5 = y_5 - 3y_4 + 3y_3 - y_2 \quad [\because \Delta = 1 - E^{-1}] \quad \dots(2) \\ \text{From (1) and (2), } \Delta^3 y_2 &= \nabla^3 y_5. \end{aligned}$$

29.5 TO FIND ONE OR MORE MISSING TERMS

When one or more values of $y = f(x)$ corresponding to the equidistant values of x are missing, we can find these using any of the following two methods :

First method : We assume the missing term or terms as a, b etc. and form the difference table. Assuming the last difference as zero, we solve these equations for a, b . These give the missing term/terms.

Second method : If n entries of y are given, $f(x)$ can be represented by a $(n-1)$ th degree polynomial i.e., $\Delta^n y = 0$. Since $\Delta = E - 1$, therefore $(E - 1)^n y = 0$. Now expanding $(E - 1)^n$ and substituting the given values, we obtain the missing term/terms.

Example 29.9. Find the missing term in the table :

$x :$	2	3	4	5	6
$y :$	45.0	49.2	54.1	...	67.4

(U.P.T.U., 2008)

Solution. Let the missing term be a . Then the difference table is as follows :

x	y	Δy	$\Delta^2 y$	$\Delta^3 y$	$\Delta^4 y$
2	45.0 ($= y_0$)	4.2			
3	49.2 ($= y_1$)	4.9	0.7	$a - 59.7$	
4	54.1 ($= y_2$)	$a - 54.1$	$a - 59.0$	$180.5 - 3a$	$240.2 - 4a$
5	a ($= y_3$)		$121.5 - a$		
6	67.4 ($= y_4$)	$67.4 - a$			

We know that $\Delta^4 y = 0$ i.e., $240.2 - 4a = 0$.

Hence $a = 60.05$.

Otherwise: As only four entries y_0, y_1, y_2, y_3 are given, therefore $y = f(x)$ can be represented by a third degree polynomial.

$\therefore \Delta^3 y = \text{constant}$ or $\Delta^4 y = 0$ i.e., $(E - 1)^4 = 0$

i.e., $(E^4 - 4E^3 + 6E^2 - 4E + 1) = 0$ or $y_4 - 4y_3 + 6y_2 - 4y_1 + y_0 = 0$

Let the missing entry y_3 be a so that

$$67.4 - 4a + 6(54.1) - 4(49.2) + 45 = 0 \text{ or } -4a = -240.2$$

Hence $a = 60.05$.

Example 29.10. Find the missing values in the following data :

$x :$	45	50	55	60	65
$y :$	3.0	...	2.0	...	-2.4

(Bhopal, 2007)

Solution. Let the missing value be a, b . Then the difference table is as follows :

x	y	Δy	$\Delta^2 y$	$\Delta^3 y$
45	3 ($= y_0$)	$a - 3$		
50	a ($= y_1$)	$2 - a$	$5 - 2a$	
55	2 ($= y_2$)	$b - 2$	$b + a - 4$	$3a + b - 9$
60	b ($= y_3$)		$-0.4 - 2b$	$3.6 - a - 3b$
65	-2.4 ($= y_4$)	$-2.4 - b$		

As only three entries y_0, y_2, y_4 are given, y can be represented by a second degree polynomial having third differences as zero.

$\therefore \Delta^3 y_0 = 0$ and $\Delta^3 y_1 = 0$

i.e., $3a + b = 9, a + 3b = 3.6$

Solving these, we get $a = 2.925, b = 0.0225$.

Otherwise. As only three entries $y_0 = 3, y_2 = 2, y_4 = -2.4$ are given, y can be represented by a second degree polynomial having third differences as zero.

$\therefore \Delta^3 y_0 = 0$ and $\Delta^3 y_1 = 0$

i.e., $(E - 1)^3 y_0 = 0$ and $(E - 1)^3 y_1 = 0$

i.e., $(E^3 - 3E^2 + 3E - 1) y_0 = 0 ; (E^3 - 3E^2 + 3E - 1) . y_1 = 0$

or $y_3 - 3y_2 + 3y_1 - y_0 = 0 ; y_4 - 3y_3 + 3y_2 - y_1 = 0$

or $y_3 + 3y_1 = 9 ; 3y_3 + y_1 = 3.6$

Solving three, we get $y_1 = 2.925, y_2 = 0.0225$.

Example 29.11. If $y_{10} = 3, y_{11} = 6, y_{12} = 11, y_{13} = 18, y_{14} = 27$, find y_4

(Mumbai, 2005)

Solution. Taking y_{14} as u_0 , we are required to find y_4 i.e., u_{-10} . Then the difference table is

x	u	Δu	$\Delta^2 u$
x_{-4}	$y_{10} = u_{-4} = 3$	3	
x_{-3}	$y_{11} = u_{-3} = 6$	5	2
x_{-2}	$y_{12} = u_{-2} = 11$	7	0
x_{-1}	$y_{13} = u_{-1} = 18$	9	2
x_0	$y_{14} = u_0 = 27$		

Then

$$\begin{aligned} y_4 &= u_{-10} = (E^{-1})^{10} u_0 = (1 - \nabla)^{10} u_0 \\ &= \left(1 - 10\nabla + \frac{10 \cdot 9}{2} \nabla^2 - \frac{10 \cdot 9 \cdot 8}{1 \cdot 2 \cdot 3} \nabla^3 + \dots \right) u_0 \\ &= u_0 - 10\nabla u_0 + 45\nabla^2 u_0 - 120\nabla^3 u_0 \\ &= 27 - 10 \times 9 + 45 \times 2 - 120 \times 0 = 27. \end{aligned}$$

Example 29.12. If y_i is a polynomial for which fifth difference is constant and $y_1 + y_2 = -7845, y_2 + y_6 = 686, y_3 + y_5 = 1088$, find y_4

(Mumbai, 2004)

Solution. Starting with y_1 instead of y_0 , we note that $\Delta^5 y_1 = 0$

[$\because \Delta^5 y_1$ is constant.]

$$\text{i.e., } (E - 1)^5 y_1 = (E^5 - 6E^4 + 15E^3 - 20E^2 + 15E^1 - 6E + 1) y_1 = 0$$

$$\therefore y_7 - 6y_6 + 15y_5 - 20y_4 + 15y_3 - 6y_2 + y_1 = 0$$

$$\text{or } (y_7 + y_1) - 6(y_6 + y_2) + 15(y_5 + y_3) - 20y_4 = 0$$

$$\begin{aligned} \text{i.e. } y_4 &= \frac{1}{20} [(y_1 + y_7) - 6(y_2 + y_6) + 15(y_3 + y_5)] \\ &= \frac{1}{20} [-784 - 6(686) + 15(1088)] = 571. \end{aligned}$$

Example 29.13. Prove the following identities :

$$(i) u_1 x + u_2 x^2 + u_3 x^3 + \dots = \frac{x}{1-x} u_1 + \left(\frac{x}{1-x} \right)^2 \Delta u_2 + \left(\frac{x}{1-x} \right)^3 \Delta^2 u_3 + \dots$$

$$(ii) u_0 + \frac{u_1 x}{1!} + \frac{u_2 x^2}{2!} + \frac{u_3 x^3}{3!} + \dots = e^x \left(u_0 + x \Delta u_0 + \frac{x^2}{2!} \Delta^2 u_0 + \frac{x^3}{3!} \Delta^3 u_0 + \dots \right).$$

Solution. (i) L.H.S. = $xu_1 + x^2 E u_1 + x^3 E^2 u_1 + \dots = x(1 + xE + x^2 E^2 + \dots) u_1$

[$\because u_{x+h} = E^h u_x$]

$$= x \cdot \frac{1}{1-xE} u_1, \text{ taking sum of infinite G.P.}$$

$$= x \left[\frac{1}{1-x(1+\Delta)} \right] u_1 \quad [\because E = 1 + \Delta]$$

$$= x \left(\frac{1}{1-x-x\Delta} \right) u_1 = \frac{x}{1-x} \left(1 - \frac{x\Delta}{1-x} \right)^{-1} u_1 = \frac{x}{1-x} \left(1 + \frac{x\Delta}{1-x} + \frac{x^2 \Delta^2}{(1-x)^2} + \dots \right) u_1$$

$$= \frac{x}{1-x} u_1 + \frac{x^2}{(1-x)^2} \Delta u_1 + \frac{x^2}{(1-x)^3} \Delta^2 u_1 + \dots = \text{R.H.S.}$$

$$\begin{aligned}
 (ii) \quad \text{L.H.S.} &= u_0 + \frac{x}{1!} Eu_0 + \frac{x^2}{2!} E^2 u_0 + \frac{x^3}{3!} E^3 u_0 + \dots \\
 &= \left(1 + \frac{xE}{1!} + \frac{x^2 E^2}{2!} + \frac{x^3 E^3}{3!} + \dots \right) u_0 = e^{xE} u_0 = e^{x(1+h)} u_0 \\
 &= e^x \cdot e^{x\Delta} u_0 = e^x \left(1 + \frac{x\Delta}{1!} + \frac{x^2 \Delta^2}{2!} + \frac{x^3 \Delta^3}{3!} + \dots \right) u_0 \\
 &= e^x \left(u_0 + \frac{x}{1!} \Delta u_0 + \frac{x^2}{2!} \Delta^2 u_0 + \frac{x^3}{3!} \Delta^3 u_0 + \dots \right) = \text{R.H.S.}
 \end{aligned}$$

PROBLEMS 29.2

1. Explain the difference between $\left(\frac{\Delta^2}{E}\right)u_x$ and $\frac{\Delta^2 u_x}{Eu_x}$. (Madras, 2003)
2. Evaluate taking h as the interval of differencing :
 (i) $\frac{\Delta^2}{E} \sin x$ (ii) $\left(\frac{\Delta^2}{E}\right) x^4$, ($h = 1$) (W.B.T.U., 2005)
 (iii) $\left(\frac{\Delta^2}{E}\right) \sin(x + h) + \frac{\Delta^2 \sin(x + h)}{E \sin(x + h)}$ (iv) $(\Delta + \nabla)^2 (x^2 + x)$, ($h = 1$).
3. With the usual notations, show that
 (i) $\nabla = 1 - e^{-hD}$ (ii) $D = \frac{2}{h} \sinh^{-1} \left(\frac{\delta}{2} \right)$
 (iii) $(1 + \Delta)(1 - \nabla) = 1$ (iv) $\Delta - \nabla = \nabla \Delta = \delta^2$. (Mumbai, 2005)
4. Prove that
 (i) $\delta = \Delta(1 + \Delta)^{-1/2} = \nabla(1 - \nabla)^{-1/2}$ (ii) $\mu^2 = 1 + \frac{\delta^2}{4}$ (U.P.T.U., 2009)
 (iii) $\delta(E^{1/2} + E^{-1/2}) = \Delta E^{-1} + \Delta$ (iv) $\nabla = \Delta E^{-1} = E^{-1} \Delta = 1 - E^{-1}$
5. Show that (i) $\mu \delta = \frac{1}{2} (\Delta + \nabla)$ (ii) $1 + \delta^2/2 = \sqrt{(1 + \delta^2 \mu^2)}$ (U.P.T.U., MCA, 2008)
 (iii) $\Delta + \nabla = \frac{\Delta}{\nabla} - \frac{\nabla}{\Delta}$ (U.P.T.U., 2009) (iv) $\nabla^2 = h^2 D^2 - h^3 D^3 + \frac{7}{12} h^4 D^4 - \dots$
6. Prove that
 (i) $\nabla' f_k = \Delta' f_{k-1}$ (ii) $\Delta f_k^2 = (f_k + f_{k+1}) \Delta f_k$ (J.N.T.U., MCA, 2006)
 (iii) $\Delta = \frac{1}{2} \delta^2 + \delta \sqrt{1 + \frac{\delta^2}{4}}$ (iv) $E^{1/2} = (1 + \delta^2/4)^{1/2} + \delta/2$.
7. Prove that $\nabla y_{n+1} = h \left(1 + \frac{1}{2} \nabla + \frac{5}{12} \nabla^2 + \dots \right) y'_n$.
8. The following table gives the values of y which is a polynomial of degree five. It is known that $f(3)$ is in error. Correct the error.
 x : 0 1 2 3 4 5 6
 y : 1 2 33 254 1025 3126 7777 (Mumbai, 2004)
9. Estimate the missing term in the following table :
 x : 0 1 2 3 4
 f(x) : 1 3 9 — 81 (S.V.T.U., 2007)
10. Find the missing terms of the following data :
 x : 1 1.5 2 2.5 3 3.5 4
 f(x) : 6 ? 10 20 ? 1.5 5 (U.P.T.U., 2010)

11. Find the missing values in the following table :

x :	0	1	2	3	4	5	6
y :	5	11	22	40	...	140	...

(V.T.U., 2006)

12. If $u_{13} = 1, u_{14} = -3, u_{15} = -1, u_{16} = 13$ find u_6 .

(Mumbai, 2004)

13. Evaluate y_4 from the following data (stating the assumptions you make) :

$$y_0 + y_5 = 1.9243, y_1 + y_7 = 1.9590, y_2 + y_6 = 1.9823, y_3 + y_5 = 1.9956.$$

(Mumbai, 2003)

14. Using the method of separation of symbols, prove that

$$(i) u_0 + u_1 + u_2 + \dots + u_n = {}^{n+1}C_1 u_0 + {}^{n+1}C_2 \Delta^2 u_0 + \dots + {}^{n+1}C_{n+1} \Delta^n u_0$$

$$(ii) y_n = y_n - {}^{n+1}C_1 \Delta y_{n-1} - {}^{n+1}C_2 \Delta^2 y_{n-2} - \dots - (-1)^{n+1} \Delta^{n+1} y_{n-(n+1)}$$

15. Using the method of finite differences, sum the following series :

$$(i) 2.5 + 5.8 + 8.11 + 11.14 + \dots \text{ to } n \text{ terms}$$

$$(ii) 1.2.3 + 2.3.4 + 3.4.5 + \dots \text{ to } n \text{ terms.}$$

$$16. \text{Prove that } u_0 + u_1 x + u_2 x^2 + \dots = \frac{u_0}{1-x} + \frac{x \Delta u_0}{(1-x)^2} + \frac{x^2 \Delta^2 u_0}{(1-x)^3} + \dots =$$

Hence sum the series $1.2 + 2.3x + 3.4x^2 + \dots \infty$.

29.6 NEWTON'S INTERPOLATION FORMULAE*

We now derive two important interpolation formulae by means of the forward and backward differences of a function. These formulae are often employed in engineering and scientific problems.

(1) **Newton's forward interpolation formula.** Let the function $y = f(x)$ take the values y_0, y_1, y_2, \dots corresponding to the values $x_0, x_0 + h, x_0 + 2h, \dots$ of x . Suppose it is required to evaluate $f(x)$ for $x = x_0 + ph$, where p is any real number.

For any real number p , we have defined E such that

$$E^p f(x) = f(x + ph)$$

$$\therefore y_p = f(x_0 + ph) = E^p f(x_0) = (1 + \Delta)^p y_0 \quad [\because E = 1 + \Delta]$$

$$= \left\{ 1 + p\Delta + \frac{p(p-1)}{2!} \Delta^2 + \frac{p(p-1)(p-2)}{3!} \Delta^3 + \dots \right\} y_0 \quad [\text{Using Binomial theorem}]$$

$$\text{i.e., } y_p = y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \Delta^2 y_0 + \frac{p(p-1)(p-2)}{3!} \Delta^3 y_0 + \dots \quad \dots(1)$$

It is called **Newton's forward interpolation formula** as (1) contains y_0 and the forward differences of y_0 .

Obs. This formula is used for interpolating the values of y near the beginning of a set of tabulated values and extrapolating values of y a little backward (i.e. to the left) of y_0 .

(2) **Newton's backward interpolation formula.** Let the function $y = f(x)$ take the values y_0, y_1, y_2, \dots corresponding to the values $x_0, x_0 + h, x_0 + 2h, \dots$ of x . Suppose it is required to evaluate $f(x)$ for $x = x_0 + ph$, where p is any real number. Then we have

$$y_p = f(x_n + ph) = E^{-p} f(x_n) = (1 - \nabla)^{-p} y_n \quad [\because E^{-1} = 1 - \nabla]$$

$$= \left[1 + p\nabla + \frac{p(p+1)}{2!} \nabla^2 + \frac{p(p+1)(p+2)}{3!} \nabla^3 + \dots \right] y_n \quad [\text{Using Binomial theorem}]$$

$$\text{i.e., } y_p = y_n + p\nabla y_n + \frac{p(p+1)}{2!} \nabla^2 y_n + \frac{p(p+1)(p+2)}{3!} \nabla^3 y_n + \dots \quad \dots(2)$$

It is called **Newton's backward interpolation formula** as (2) contains y_n and backward differences of y_n .

Obs. This formula is used for interpolating the values of y near the end of a set of tabulated values and also for extrapolating values of y a little ahead (to the right) of y_n .

Example 29.14. The table gives the distances in nautical miles of the visible horizon for the given heights in feet above the earth's surface :

$$x = \text{height} : \quad 100 \quad 150 \quad 200 \quad 250 \quad 300 \quad 350 \quad 400$$

$$y = \text{distance} : \quad 10.63 \quad 13.03 \quad 15.04 \quad 16.81 \quad 18.42 \quad 19.90 \quad 21.27$$

Find the values of y when (i) $x = 218$ ft (Madras, 2003 S) (ii) 410 ft.

(V.T.U., 2002)

Solution. The difference table is as under :

x	y	Δ	Δ^2	Δ^3	Δ^4
100	10.63	2.40			
150	13.03	2.01	-0.39	0.15	
200	15.04	1.77	-0.24	0.08	-0.07
250	16.81	1.61	-0.16	0.03	-0.05
300	18.42	1.48	-0.13	0.02	-0.01
350	19.90	1.37	-0.11		
400	21.27				

(i) If we take $x_0 = 200$, then $y_0 = 15.04$, $\Delta y_0 = 1.77$, $\Delta^2 y_0 = -0.16$, $\Delta^3 y_0 = 0.03$ etc.

$$\text{Since } x = 218 \text{ and } h = 50, \therefore p = \frac{x - x_0}{h} = \frac{18}{50} = 0.36$$

∴ Using Newton's forward interpolation formula, we get

$$y_{218} = y_0 + p\Delta y_0 + \frac{p(p-1)}{1.2} \Delta^2 y_0 + \frac{p(p-1)(p-2)}{1.2.3} \Delta^3 y_0 + \dots$$

$$f(218) = 15.04 + 0.36(1.77) + \frac{0.36(-0.64)}{2} (-0.16) + \frac{0.36(-0.64)(-1.64)}{6} (0.03) + \dots$$

$$= 15.04 + 0.637 + 0.018 + 0.001 + \dots = 15.696 \text{ i.e., 15.7 nautical miles}$$

(ii) Since $x = 410$ is near the end of the table, we use Newton's backward interpolation formula.

$$\therefore \text{taking } x_n = 400, p = \frac{x - x_n}{h} = \frac{10}{50} = 0.2$$

Using the line of backward differences

$$y_n = 21.27, \nabla y_n = 1.37, \nabla^2 y_n = -0.11, \nabla^3 y_n = 0.02 \text{ etc.}$$

∴ newton's backward formula gives

$$y_{410} = y_{400} + p\nabla y_{400} + \frac{p(p+1)}{2} \nabla^2 y_{400} + \frac{p(p+1)(p+2)}{1.2.3} \nabla^3 y_{400} + \dots$$

$$= 21.27 + 0.2(1.37) + \frac{0.2(1.2)}{2} (-0.11) + \dots = 21.53 \text{ nautical miles.}$$

Example 29.15. From the following table, estimate the number of students who obtained marks between 40 and 45 :

Marks	30—40	40—50	50—60	60—70	70—80
No. of Students	31	42	51	35	31

(V.T.U., 2011 S ; S.V.T.U., 2007 ; Madras, 2006)

Solution. First we prepare the cumulative frequency table, as follows :

$$\text{Marks less than (x)} : \quad 40 \quad 50 \quad 60 \quad 70 \quad 80$$

$$\text{No. of Students (y}_x\text{)} : \quad 31 \quad 73 \quad 124 \quad 159 \quad 190$$

Now the difference table is

x	y	Δy_x	$\Delta^2 y_x$	$\Delta^3 y_x$	$\Delta^4 y_x$
40	31	42			
50	73	51	9	-25	
60	124	35	-16	12	37
70	159	31	-4		
80	190				

We shall find y_{45} i.e. number of students with marks less than 45.

Taking $x_0 = 40$, $x = 45$, we have $p = \frac{x - x_0}{h} = \frac{5}{10} = 0.5$ [∴ $h = 10$]

∴ using Newton's forward interpolation formula, we get

$$\begin{aligned}y_{45} &= y_{40} + p\Delta y_{40} + \frac{p(p-1)}{2} \Delta^2 y_{40} + \frac{p(p-1)(p-2)}{1 \cdot 2 \cdot 3} \Delta^3 y_{40} + \dots \\&= 31 + 0.5 \times 42 + \frac{0.5(-0.5)}{2} \times 9 + \frac{0.5(0.5)(-1.5)}{6} \times (-25) + \frac{0.5(-0.5)(-1.5)(-2.5)}{24} \times 37 \\&= 47.87, \text{ on simplification.}\end{aligned}$$

∴ the number of students with marks less than 45 is 47.87 i.e., 48.

But the number of students with marks less than 40 is 31.

Hence the number of students getting marks between 40 and 45 = 48 - 31 = 17.

Example 29.16. Find the cubic polynomial which takes the following values :

x :	0	1	2	3
$f(x)$:	1	2	1	10

Hence or otherwise evaluate $f(4)$.

(Bhopal, 2009 ; Rohtak, 2005 ; W.B.T.U., 2005)

Solution. The difference table is

x	$f(x)$	$\Delta f(x)$	$\Delta^2 f(x)$	$\Delta^3 f(x)$
0	1		1	
1	2	-1	-2	
2	1	9	10	
3	10			12

We take $x_0 = 0$ and $p = \frac{x - 0}{h} = x$ [∴ $h = 1$]

∴ using Newton's forward interpolation formula, we get

$$\begin{aligned}f(x) &= f(0) + \frac{x}{1} \Delta f(0) + \frac{x(x-1)}{1 \cdot 2} \Delta^2 f(0) + \frac{x(x-1)(x-2)}{1 \cdot 2 \cdot 3} \Delta^3 f(0) \\&= 1 + x(1) + \frac{x(x-1)}{2} (-2) + \frac{x(x-1)(x-2)}{6} (12) \\&= 2x^3 - 7x^2 + 6x + 1, \text{ which is the required polynomial.}\end{aligned}$$

To compute $f(4)$, we take $x_n = 3$, $x = 4$ so that $p = \frac{x - x_n}{h} = 1$ [∴ $h = 1$]

Using Newton's backward interpolation formula, we get

$$\begin{aligned}f(4) &= f(3) + p \nabla f(3) + \frac{p(p+1)}{1 \cdot 2} \nabla^2 f(3) + \frac{p(p+1)(p+2)}{1 \cdot 2 \cdot 3} \nabla^3 f(3) \\&= 10 + 9 + 10 + 12 + 41.\end{aligned}$$

which is the same value as that obtained by substituting $x = 4$ in the cubic polynomial above.

Obs. The above example shows that if a tabulated function is a polynomial, then interpolation and extrapolation give the same values.

Example 29.17. In the table below, the values of y are consecutive terms of a series of which 23.6 is the 6th term. Find the first and tenth terms of the series :

x :	3	4	5	6	7	8	9
y :	4.8	8.4	14.5	23.6	36.2	52.8	73.9

(Anna, 2007)

Solution. The difference table is

x	y	Δy	$\Delta^2 y$	$\Delta^3 y$	$\Delta^4 y$
3	4.8		3.6		
4	8.4	6.1	2.5	0.5	
5	14.5	9.1	3.0	0.5	0
6	23.6	12.6	3.5	0.5	0
7	36.2	16.6	4.0	0.5	0
8	52.8	21.1	4.5		
9	73.9				

To find the first term, use Newton's forward interpolation formula with $x_0 = 3$, $x = 1$, $h = 1$ and $p = -2$. We have

$$y(1) = 4.8 + \frac{(-2)}{1} \times 3.6 + \frac{(-2)(-3)}{1.2} \times 2.5 + \frac{(-2)(-3)(-4)}{1.2.3} \times 0.5 = 3.1$$

To obtain the tenth term, use Newton's backward interpolation formula with $x_n = 9$, $x = 10$, $h = 1$ and $p = 1$. This gives

$$y(10) = 73.9 + \frac{1}{1} \times 21.1 + \frac{1(2)}{1.2} \times 4.5 + \frac{1(2)(3)}{1.2.3} \times 0.5 = 100.$$

PROBLEMS 29.3

1. Using Newton's forward formula, find the value of $f(1.6)$, if

x :	1	1.4	1.8	2.2
$f(x)$:	3.49	4.82	5.96	6.5

(J.N.T.U., 2006)

2. State Newton's interpolation formula and use it to calculate the value of $\exp(1.85)$, given the following table:

x :	1.7	1.8	1.9	2.0	2.1	2.2	2.3
$f(x)$:	5.474	6.050	6.686	7.389	8.166	9.025	9.974

(Kottayam, 2005)

3. If $f(1.15) = 1.0723$, $f(1.20) = 1.0954$, $f(1.25) = 1.1180$ and $f(1.30) = 1.1401$, find $f(1.28)$.

4. Given $\sin 45^\circ = 0.7071$, $\sin 50^\circ = 0.7660$, $\sin 55^\circ = 0.8192$, $\sin 60^\circ = 0.8660$, find $\sin 52^\circ$, using Newton's forward formula.

5. From the following table of half-yearly premium for policies maturing at different ages, estimate the premium for policies maturing at age of 46.

Age	45	50	55	60	65
Premium (in rupees)	114.84	96.16	83.32	74.48	68.48

(U.P.T.U., 2010)

6. The area A of a circle of diameter d is given for the following values:

d :	80	85	90	95	100
A :	5026	5674	6362	7088	7854

(V.T.U., 2010)

Calculate the area of a circle of diameter 105.

7. Estimate the value of $f(22)$ and $f(42)$ from the following available data:

x :	20	25	30	35	40	45
$f(x)$:	354	332	291	260	231	204

(J.N.T.U., 2007)

8. From the following table:

x° :	10	20	30	40	50	60	70	80
$\cos x$:	0.9848	0.9397	0.8660	0.7660	0.6428	0.5000	0.3420	0.1737

Calculate $\cos 25^\circ$ and $\cos 73^\circ$ using Gregory Newton formulae.

(U.P.T.U., 2006)

9. Find the number of men getting wages below Rs. 15 from the following data :

Wages in Rs. : 0—10	10—20	20—30	30—40
Frequency : 9	30	35	42

(Nagarjuna, 2001)

10. Find the polynomial interpolating the data :

x : 0	1	2
f(x) : 0	5	2

(U.P.T.U., 2008)

11. Construct Newton's forward interpolation polynomial for the following data :

x : 4	6	8	10
y : 1	3	8	16

(Madras, 2006)

Hence evaluate y for x = 5.

12. Construct the difference table for the following data :

x : 0.1	0.3	0.5	0.7	0.9	1.1	1.3
f(x) : 0.003	0.067	0.148	0.248	0.370	0.518	0.697

(J.N.T.U., 2007)

13. Estimate from following table f(3.8) to three significant figures using Gregory Newton backward interpolation formula:

x : 0	1	2	3	4
f(x) : 1	1.5	2.2	3.1	4.6

(U.P.T.U., 2009)

14. The following table gives the population of a town during the last six censuses. Estimate the increase in the population during the period from 1976 to 1978 :

Year : 1941	1951	1961	1971	1981	1991
Population (in thousands) : 12	15	20	27	39	52

(U.P.T.U., 2009)

15. In the following table, the values of y are consecutive terms of a series of which 12.5 is the 5th term. Find the first and tenth terms of the series.

x : 3	4	5	6	7	8	9
y : 2.7	6.4	12.5	21.6	34.3	51.2	72.9

(P.T.U., 2001)

16. Given $u_1 = 40$, $u_3 = 45$, $u_5 = 54$, find u_2 and u_4 .

(Nagarjuna, 2003 S)

17. If $u_{-1} = 10$, $u_1 = 8$, $u_2 = 10$, $u_4 = 50$, find u_0 and u_3 .

18. Given $y_0 = 3$, $y_1 = 12$, $y_2 = 81$, $y_3 = 200$, $y_4 = 100$, $y_5 = 8$, without forming the difference table, find $\Delta^5 y_0$.

29.7 CENTRAL DIFFERENCE INTERPOLATION FORMULAE

In the preceding section, we derived Newton's forward and backward interpolation formulae which are applicable for interpolation near the beginning and end of tabulated values. Now we shall develop central difference formulae which are best suited for interpolation near the middle of the table.

If x takes the values $x_0 - 2h$, $x_0 - h$, x_0 , $x_0 + h$, $x_0 + 2h$ and the corresponding values of $y = f(x)$ are y_{-2} , y_{-1} , y_0 , y_1 , y_2 , then we can write the difference table in the two notations as follows :

x	y	1st diff.	2nd diff.	3rd diff.	4th diff.
$x_0 - 2h$	y_{-2}				
$x_0 - h$	y_{-1}	$\Delta y_{-2} (= \delta y_{-3/2})$	$\Delta^2 y_{-2} (= \delta^2 y_{-1})$		
x_0	y_0	$\Delta y_{-1} (= \delta y_{-1/2})$	$\Delta^2 y_{-1} (\delta^2 y_0)$	$\Delta^3 y_{-2} (= \delta^3 y_{-1/2})$	$\Delta^4 y_{-2} (= \delta^4 y_0)$
$x_0 + h$	y_1	$\Delta y_0 (= \delta y_{1/2})$	$\Delta^2 y_0 (= \delta^2 y_1)$	$\Delta^3 y_{-1} (= \delta^3 y_{1/2})$	
$x_0 + 2h$	y_2	$\Delta y_1 (= \delta y_{3/2})$			

- (1) **Gauss's forward interpolation formula.** The Newton's forward interpolation formula is

$$y_p = y_0 + p\Delta y_0 + \frac{p(p-1)}{1 \cdot 2} \Delta^2 y_0 + \frac{p(p-1)(p-2)}{1 \cdot 2 \cdot 3} \Delta^3 y_0 + \dots \quad \dots(1)$$

- We have $\Delta^2 y_0 - \Delta^2 y_{-1} = \Delta^3 y_{-1}$... (2)
i.e., $\Delta^2 y_0 = \Delta^2 y_{-1} + \Delta^3 y_{-1}$... (3)
- Similarly $\Delta^3 y_0 = \Delta^3 y_{-1} + \Delta^4 y_{-1}$... (4)
- Also $\Delta^4 y_0 = \Delta^4 y_{-1} + \Delta^5 y_{-1}$ etc.
- i.e.,* $\Delta^3 y_{-1} - \Delta^3 y_{-2} = \Delta^4 y_{-2}$
- Similarly $\Delta^4 y_{-1} = \Delta^4 y_{-2} + \Delta^5 y_{-2}$ etc. ... (5)

Substituting for $\Delta^2 y_0, \Delta^3 y_0, \Delta^4 y_0 \dots$ from (2), (3), (4) ... in (1), we get

$$\begin{aligned} y_p &= y_0 + p\Delta y_0 + \frac{p(p-1)}{1 \cdot 2} (\Delta^2 y_{-1} + \Delta^3 y_{-1}) + \frac{p(p-1)(p-2)}{1 \cdot 2 \cdot 3} (\Delta^3 y_{-1} + \Delta^4 y_{-1}) \\ &\quad + \frac{p(p-1)(p-2)(p-3)}{1 \cdot 2 \cdot 3 \cdot 4} (\Delta^4 y_{-1} + \Delta^5 y_{-1}) + \dots \end{aligned}$$

$$\text{Hence } y_p = y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} \Delta^3 y_{-1} + \frac{(p+1)p(p-1)(p-2)}{4!} \Delta^4 y_{-2} + \dots \text{ [Using (5)]}$$

which is called *Gauss's forward interpolation formula*.

Cor. In the central differences notation, this formula will be

$$y_p = y_0 + p\delta y_{1/2} + \frac{p(p-1)}{2!} \delta^2 y_0 + \frac{(p+1)p(p-1)}{3!} \delta^3 y_{1/2} + \frac{(p+1)p(p-1)(p-2)}{4!} \delta^4 y_0 + \dots$$

Obs. 1. It employs odd differences just below the central line and even difference on the central line as shown below:

Obs. 2. This formula is used to interpolate the values of y for p ($0 < p < 1$) measured forwardly from the origin.

(2) Gauss's backward interpolation formula. The Newton's forward interpolation formula is

$$y_p = y_0 + p\Delta y_0 + \frac{p(p-1)}{1 \cdot 2} \Delta^2 y_0 + \frac{p(p-1)(p-2)}{1 \cdot 2 \cdot 3} \Delta^3 y_0 + \dots \quad \dots (1)$$

- We have $\Delta y_0 - \Delta y_{-1} = \Delta^2 y_{-1}$... (2)
i.e., $\Delta y_0 = \Delta y_{-1} + \Delta^2 y_{-1}$... (3)
- Similarly $\Delta^2 y_0 = \Delta^2 y_{-1} + \Delta^3 y_{-1}$... (4)
- Also $\Delta^3 y_{-1} - \Delta^3 y_{-2} = \Delta^4 y_{-2}$... (5)
i.e., $\Delta^3 y_{-1} = \Delta^3 y_{-2} + \Delta^4 y_{-2}$... (6)
- Similarly $\Delta^4 y_{-1} = \Delta^4 y_{-2} + \Delta^5 y_{-2}$ etc. ... (6)
- Substituting for $\Delta y_0, \Delta^2 y_0, \Delta^3 y_0, \dots$ from (2), (3), (4) in (1), we get
- $$\begin{aligned} y_p &= y_0 + p(\Delta y_{-1} + \Delta^2 y_{-1}) + \frac{p(p-1)}{1 \cdot 2} (\Delta^2 y_{-1} + \Delta^3 y_{-1}) + \frac{p(p-1)(p-2)}{1 \cdot 2 \cdot 3} (\Delta^3 y_{-1} + \Delta^4 y_{-1}) \\ &\quad + \frac{p(p-1)(p-2)(p-3)}{1 \cdot 2 \cdot 3 \cdot 4} (\Delta^4 y_{-1} + \Delta^5 y_{-1}) + \dots \\ &= y_0 + p\Delta y_{-1} + \frac{(p+1)p}{1 \cdot 2} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{1 \cdot 2 \cdot 3} \Delta^3 y_{-1} + \frac{(p+1)p(p-1)(p-2)}{1 \cdot 2 \cdot 3 \cdot 4} \Delta^4 y_{-1} \\ &\quad + \frac{p(p-1)(p-2)(p-3)}{1 \cdot 2 \cdot 3 \cdot 4} \Delta^5 y_{-1} + \dots \end{aligned}$$

$$= y_0 + p\Delta y_{-1} + \frac{(p+1)p}{1 \cdot 2} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{1 \cdot 2 \cdot 3} (\Delta^3 y_{-2} + \Delta^4 y_{-2}) \\ + \frac{(p+1)p(p-1)(p-2)}{1 \cdot 2 \cdot 3 \cdot 4} (\Delta^4 y_{-2} + \Delta^5 y_{-2}) + \dots \quad [\text{Using (5) and (6)}]$$

Hence $y_p = y_0 + p\Delta y_{-1} + \frac{(p+1)p}{2!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} \Delta^3 y_{-2} + \frac{(p+2)(p+1)p(p-1)}{4!} \Delta^4 y_{-2} + \dots$

which is called *Gauss's backward interpolation formula*.

Cor. In the central differences notation, this formula will be

$$y_p = y_0 + p\delta y_{-1/2} + \frac{(p+1)p}{2!} \delta^2 y_0 + \frac{(p+1)p(p-1)}{3!} \delta^3 y_{-1/2} + \frac{(p+2)(p+1)p(p-1)}{4!} \delta^4 y_0 + \dots$$

Obs. 1. This formula contains odd differences above the central line and even differences on the central line as shown below :

Obs. 2. It is used to interpolate the values of y for a negative value of p lying between -1 and 0.

Obs. 3. Gauss's forward and backward formulae are not of much practical use. However, these serve as intermediate steps for obtaining the important formulae of the following sections.

(3) Stirling's formula.* Gauss's forward interpolation formula is

$$y_p = y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} \Delta^3 y_{-1} + \frac{(p+1)p(p-1)(p-2)}{4!} \Delta^4 y_{-2} + \dots \quad \dots(1)$$

Gauss's backward interpolation formula is

$$y_p = y_0 + p\Delta y_{-1} + \frac{(p+1)p}{2!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} \Delta^3 y_{-2} + \frac{(p+2)(p+1)p(p-1)}{4!} \Delta^4 y_{-2} + \dots \quad \dots(2)$$

Taking the mean of (1) and (2), we obtain

$$y_p = y_0 + p \left(\frac{\Delta y_0 + \Delta y_{-1}}{2} \right) + \frac{p^2}{2!} \Delta^2 y_{-1} + \frac{p(p^2-1)}{3!} \times \left(\frac{\Delta^3 y_{-1} + \Delta^3 y_{-2}}{2} \right) + \frac{p^2(p^2-1)^2}{4!} \Delta^4 y_{-2} + \dots \quad \dots(3)$$

which is called *Stirling's formula*.

Cor. In the central differences notation, (3) takes the form

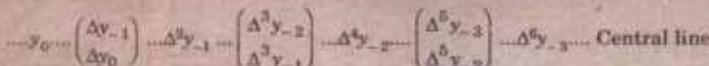

$$y_p = y_0 + p \mu \delta y_0 + \frac{p^2}{2!} \delta^2 y_0 + \frac{p(p^2+1^2)}{3!} \mu \delta^3 y_0 + \frac{p^2(p^2-1^2)}{4!} \delta^4 y_0 + \dots \quad \dots(4)$$

for

$$\frac{1}{2}(\Delta y_0 + \Delta y_{-1}) = \frac{1}{2}(\delta y_{1/2} + \delta y_{-1/2}) = \mu \delta y_0$$

$$\frac{1}{2}(\Delta^3 y_{-1} + \Delta^3 y_{-2}) = \frac{1}{2}(\delta^3 y_{1/2} + \delta^3 y_{-1/2}) = \mu \delta^3 y_0 \text{ etc.}$$

Obs. This formula involves means of the odd differences just above and below the central line and even differences on this line as shown below :

(4) Bessel's formula.** Gauss's forward interpolation formula is

$$y_p = y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} \Delta^3 y_{-1} + \frac{(p+1)p(p-1)(p-2)}{4!} \Delta^4 y_{-2} + \dots \quad \dots(1)$$

*Named after the Scottish mathematicians James Stirling (1692-1770).

**See footnote p. 550.

- We have $\Delta^2 y_0 - \Delta^2 y_{-1} = \Delta^3 y_{-1}$... (2)
 i.e., $\Delta^2 y_{-1} = \Delta^2 y_0 - \Delta^3 y_{-1}$... (3)
- Similarly $\Delta^4 y_{-2} = \Delta^4 y_{-1} - \Delta^5 y_{-2}$ etc.

Now (1) can be written as

$$\begin{aligned}
 y_p &= y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \left(\frac{1}{2} \Delta^2 y_{-1} + \frac{1}{2} \Delta^2 y_{-1} \right) + \frac{p(p^2-1)}{3!} \Delta^3 y_{-1} \\
 &\quad + \frac{p(p^2-1)(p-2)}{4!} \left(\frac{1}{2} \Delta^4 y_{-2} + \frac{1}{2} \Delta^4 y_{-2} \right) + \dots \\
 &= y_0 + p\Delta y_0 + \frac{1}{2} \frac{p(p-1)}{2!} \Delta^2 y_{-1} + \frac{1}{2} \frac{p(p-1)}{2!} (\Delta^2 y_0 - \Delta^3 y_{-1}) + \frac{p(p^2-1)}{3!} \Delta^3 y_{-1} \\
 &\quad + \frac{1}{2} \frac{p(p^2-1)(p-2)}{4!} \Delta^4 y_{-2} + \frac{1}{2} \frac{p(p^2-1)(p-2)}{4!} \times (\Delta^4 y_{-1} - \Delta^5 y_{-2}) + \dots \quad [\text{Using (2), (3) etc.}] \\
 &= y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \cdot \frac{\Delta^2 y_{-1} + \Delta^2 y_0}{2} + \frac{p(p-1)}{2!} \times \left(\frac{p+1}{3} - \frac{1}{2} \right) \Delta^3 y_{-1} \\
 &\quad + \frac{p(p^2-1)(p-2)}{4!} \cdot \frac{\Delta^4 y_{-2} + \Delta^4 y_{-1}}{2} + \dots
 \end{aligned}$$

$$\begin{aligned}
 \text{Hence } y_p &= y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \cdot \frac{\Delta^2 y_{-1} + \Delta^2 y_0}{2} + \frac{(p-1/2)p(p-1)}{3!} \Delta^3 y_{-1} \\
 &\quad + \frac{(p+1)p(p-1)(p-2)}{4!} \cdot \frac{\Delta^4 y_{-2} + \Delta^4 y_{-1}}{2} + \dots \quad \dots (4)
 \end{aligned}$$

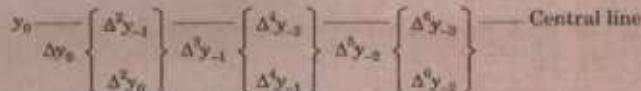

which is known as the *Bessel's formula*.

Cor. In the central differences notation, (4) becomes

$$y_p = y_0 + p\delta y_{1/2} + \frac{p(p-1)}{2!} \mu\delta^2 y_{1/2} + \frac{(p-1/2)p(p-1)}{3!} \delta^3 y_{1/2} + \frac{(p+1)p(p-1)(p-2)}{4!} \mu\delta^4 y_{1/2} + \dots \quad \dots (5)$$

$$\text{for } \frac{1}{2}(\Delta^2 y_{-1} + \Delta^2 y_0) = y\delta^2 y_{1/2}, \frac{1}{2}(\Delta^4 y_{-2} + \Delta^4 y_{-1}) = \mu\delta^4 y_{1/2} \text{ etc.}$$

Obs. This is a very useful formula for practical purposes. It involves odd differences below the central line and means of even differences of and below this line as shown below:

(5) **Everett's formula.** Gauss's forward interpolation formula is

$$\begin{aligned}
 y_p &= y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} \Delta^3 y_{-1} + \frac{(p+1)p(p-1)(p-2)}{4!} \Delta^4 y_{-2} \\
 &\quad + \frac{(p+2)(p+1)p(p-1)(p-2)}{5!} \Delta^5 y_{-2} + \dots \quad \dots (1)
 \end{aligned}$$

We eliminate the odd difference in (1) by using the relations

$$\Delta y_0 = y_1 - y_0, \Delta^3 y_{-1} = \Delta^2 y_0 - \Delta^2 y_{-1}, \Delta^5 y_{-2} = \Delta^4 y_{-1} - \Delta^4 y_{-2} \text{ etc.}$$

Then (1) becomes

$$\begin{aligned}
 y_p &= y_0 + p(y_1 - y_0) + \frac{p(p-1)}{2!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} (\Delta^2 y_0 - \Delta^2 y_{-1}) \\
 &\quad + \frac{(p+1)p(p-1)(p-2)}{4!} \Delta^4 y_{-2} + \frac{(p+2)(p+1)p(p-1)(p-2)}{5!} \times (\Delta^4 y_{-1} - \Delta^4 y_{-2}) + \dots \\
 &= (1-p)y_0 + py_1 - \frac{p(p-1)(p-2)}{3!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} \Delta^2 y_0
 \end{aligned}$$

$$-\frac{(p+1)p(p-1)(p-2)(p-3)}{5!} \Delta^5 y_{-2} + \frac{(p+2)(p+1)p(p-1)(p-2)}{5!} \Delta^5 y_{-1} - \dots$$

To change the terms with negative sign, putting $p = 1 - q$, we obtain

$$\begin{aligned} y_p = qy_0 + \frac{q(q^2 - 1^2)}{3!} \Delta^2 y_{-1} + \frac{q(q^2 - 1^2)(q^2 - 2^2)}{5!} \Delta^4 y_{-2} + \dots + py_1 + \frac{p(p^2 - 1^2)}{3!} \Delta^2 y_0 \\ + \frac{p(p^2 - 1^2)(p^2 - 2^2)}{5!} \Delta^4 y_{-1} + \dots \end{aligned}$$

This is known as *Everett's formula*.

Obs. This formula is extensively used and involves only even differences on and below the central line as shown below :

$$\begin{array}{cccccc} y_0 & \Delta^2 y_{-1} & \Delta^4 y_{-2} & \Delta^6 y_{-3} & \text{Central line} \\ - & - & - & - & - \\ y_1 & \Delta^2 y_0 & \Delta^4 y_{-1} & \Delta^6 y_{-2} & \end{array}$$

29.8 CHOICE OF AN INTERPOLATION FORMULA

The coefficients in the central difference formulae are smaller and converge faster than those in Newton's formulae. After a few terms, the coefficients in the Stirling's formula decrease more rapidly than those of the Bessel's formula and the coefficients of Bessel's formula decrease more rapidly than those of Newton's formula. As much, whenever possible, central difference formulae should be used in preference to Newton's formulae.

The right choice of an interpolation formula however, depends on the position of the interpolated value in the given data.

The following rules will be found useful :

1. To find a tabulated value near the beginning of the table, use Newton's forward formula.
2. To find a value near the end of the table, use Newton's backward formula.
3. To find an interpolated value near the centre of the table, use either Stirling's or Bessel's or Everett's formula.

If interpolation is required for p lying between $-1/4$ and $1/4$, prefer Stirling's formula.

If interpolation is desired for p lying between $1/4$ and $3/4$, use Bessel's or Everett's formula.

Example 29.18. Find $f(22)$ from the Gauss forward formula :

x :	20	25	30	35	40	45
$f(x)$:	354	332	291	260	231	204

(J.N.T.U., 2007)

Solution. Taking $x_0 = 25$, $h = 5$, we have to find the value of $f(x)$ for $x = 22$.

$$\text{i.e., for } p = \frac{x - x_0}{h} = \frac{22 - 25}{5} = -0.6$$

The difference table is as follows :

x	p	y_p	Δy_p	$\Delta^2 y_p$	$\Delta^3 y_p$	$\Delta^4 y_p$	$\Delta^5 y_p$
20	-1	354 ($= y_{-1}$)		-22			
25	0	332 ($= y_0$)		-19			
30	1	291 ($= y_1$)		-41	29		
35	2	260 ($= y_2$)		-31	10	-37	45
40	3	231 ($= y_3$)		-29	2	8	
45	4	204 ($= y_4$)		-27			

Gauss forward formula is

$$\begin{aligned}
 y^p = y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} \Delta^3 y_{-1} \\
 + \frac{(p+1)p(p-1)(p-2)}{4!} \Delta^4 y_{-2} + (p+1)(p-1)(p-2)(p+2) \Delta^5 y_{-2} \\
 f(22) = 332 + (0.6)(-41) + \frac{(-0.6)(-0.6-1)}{2!} (-19) + \frac{(-0.6+1)(-0.6)(-0.6-1)}{3!} (-8) \\
 + \frac{(-0.6-1)(-0.6)(-0.6-1)(-0.6-2)}{4!} (-37) \\
 + \frac{(-0.6+1)(-0.6)(-0.6-1)(-0.6-2)(-0.6+2)}{5!} (45) \\
 = 332 + 24.6 - 9.12 + 1.5392 - 0.5241
 \end{aligned}$$

Hence $f(22) = 347.983$.

Example 29.19. Interpolate by means of Gauss's backward formula, the population of a town for the year 1974, given that :

Year	:	1939	1949	1959	1969	1979	1989
Population (in thousands)	:	12	15	20	27	39	52

(Kottayam, 2005 ; Madras, 2003)

Solution. Taking $x_0 = 1969$, $h = 10$, the population of the town is to be found for $p = \frac{1974 - 1969}{10} = 0.5$.

The central difference table is

x	p	y_p	Δy_p	$\Delta^2 y_p$	$\Delta^3 y_p$	$\Delta^4 y_p$	$\Delta^5 y_p$
1939	-3	12		3			
1949	-2	15	3	2			
1959	-1	20	5	0			
1969	0	27	7	2	3		
1979	1	39	12	5	-4		
1989	2	52	13	1			

Gauss's backward formula is

$$\begin{aligned}
 y_p = y_0 + p\Delta y_{-1} + \frac{(p+1)p}{2!} \Delta^2 y_{-1} + \frac{(p+1)p(p-1)}{3!} \Delta^3 y_{-2} + \frac{(p+1)(p+1)p(p-1)}{4!} \Delta^4 y_{-2} \\
 + \frac{(p+2)(p+1)p(p-1)(p-2)}{5!} \Delta^5 y_3 + \dots
 \end{aligned}$$

$$\begin{aligned}
 i.e., \quad y_5 &= 27 + (0.5)(7) + \frac{(1.5)(0.5)}{2}(5) + \frac{(1.5)(0.5)(-0.5)}{6}(3) + \frac{(2.5)(1.5)(-0.5)}{24}(-7) \\
 &\quad + \frac{(2.5)(1.5)(0.5)(-0.5)(-1.5)}{120}(-10) \\
 &= 27 + 3.5 + 1.875 - 0.1875 + 0.2743 - 0.1172 = 32.345 \text{ thousands approx.}
 \end{aligned}$$

Example 29.20. Given

0°	0	5	10	15	20	25	30
$\tan \theta$	0	0.0875	0.1763	0.2679	0.3640	0.4663	0.5774

Using Stirling's formula, estimate the value of $\tan 16^\circ$.

(Anna, 2005)

Solution. Taking the origin at $\theta = 15^\circ$, $h = 5^\circ$ and $p = \frac{\theta - 15}{5}$, we have the following central difference table :

P	0.0000	0.0875	0.1763	0.2679	0.3640	0.4663	0.5774
-3		0.0875					
-2			0.0888				
-1				0.0916			
0					0.0961		
1						0.1023	
2							0.1111
3							

$$\text{At } \theta = 16^\circ, \quad p = \frac{16 - 15}{5} = 0.2$$

Stirling's formula is

$$y_p = y_0 + \frac{p}{1} \cdot \frac{\Delta y_{-1} + \Delta y_0}{2} + \frac{p^2}{2!} \Delta^2 y_{-1} + \frac{p(p^2 - 1)}{3!} \cdot \frac{\Delta^3 y_{-2} + \Delta^3 y_{-1}}{2} + \frac{p^2(p^2 - 1)}{4!} \Delta^4 y_{-2} + \dots$$

$$\therefore y_{0.2} = 0.2679 + (0.2) \left(\frac{0.0916 + 0.0961}{2} \right) + \frac{(0.2)^2}{2!} (0.0045) + \dots$$

$$= 0.2679 + 0.01877 + 0.00009 + \dots = 0.28676$$

$$\text{Hence } \tan 16^\circ = 0.28676.$$

Example 29.21. Employ Stirling's formula to compute $y_{12.2}$ from the following table ($y_x = 1 + \log_{10} \sin x$) :

x°	10	11	12	13	14
$10^5 y_x$	23,967	28,060	31,788	35,209	38,368

(V.T.U., 2004)

Solution. Taking the origin at $x_0 = 12^\circ$, $h = 1$ and $p = x - 12$, we have the following central table :

P	y_x	Δy_x	$\Delta^2 y_x$	$\Delta^3 y_x$	$\Delta^4 y_x$
-2	0.23967		0.04093		
-1	0.28060		0.03728	-0.00365	0.00058
0	0.31788		0.034121	-0.00307	-0.00045
1	0.35209		0.03159	-0.00062	-0.00013
2	0.38368				

At $x = 12.2$, $p = 0.2$. (As p lies between $-1/4$ and $1/4$, the use of Stirling's formula will be quite suitable.)

Stirling's formula is

$$y_p = y_0 + \frac{p}{1} \cdot \frac{\Delta y_{-1} + \Delta y_0}{2} + \frac{p^2}{2!} \Delta^2 y_{-1} + \frac{p(p^2 - 1)}{3!} \cdot \frac{\Delta^3 y_{-2} + \Delta^3 y_{-1}}{2} + \frac{p^2(p^2 - 1)}{4!} \Delta^4 y_{-2} + \dots$$

When $p = 0.2$, we have

$$\begin{aligned} \therefore y_{0.2} &= 0.31788 + 0.2 \left(\frac{0.03728 + 0.03421}{2} \right) + \frac{(0.2)^2}{2} (-0.00307) \\ &\quad + \frac{(0.2)[(0.2)^2 - 1]}{6} \left(\frac{0.00058 - 0.00045}{2} \right) + \frac{(0.2)^2[(0.2)^2 - 1]}{24} (-0.00013) \\ &= 0.31788 + 0.00715 - 0.00006 - 0.000002 + 0.0000002 = 0.32497. \end{aligned}$$

Example 29.22. Apply Bessel's formula to obtain y_{25} , given $y_{20} = 2854$, $y_{24} = 3162$, $y_{28} = 3544$, $y_{32} = 3992$.
(S.V.T.U., 2007; V.T.U., 2009 S)

Solution. Taking the origin at $x_0 = 24$, $h = 4$, we have $p = \frac{1}{4}(x - 24)$.

∴ The central difference table is

p	y	Δy	$\Delta^2 y$	$\Delta^3 y$
-1	2854			
0	3162	308		
1	3544	382	74	
2	3992	448	66	-8

At $x = 25$, $p = (25 - 24)/4 = 1/4$. (As p lies between 1/4 and 3/4, the use of Bessel's formula will yield accurate result.)

Bessel's formula is

$$y_p = y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \frac{\Delta^2 y_{-1} + \Delta^2 y_0}{2} + \frac{(p-1/2)p(p-1)}{3!} \Delta^3 y_{-1} + \dots \quad \dots(1)$$

When $p = 0.25$, we have

$$\begin{aligned} y_p &= 3162 + 0.25 \times 382 + \frac{0.25(-0.75)}{2} \left(\frac{74 + 66}{2} \right) + \frac{(-0.25)0.25(-0.75)}{6} (-8) \\ &= 3162 + 95.5 - 6 - 5625 - 0.0625 = 3250.875 \text{ approx.} \end{aligned}$$

Example 29.23. Apply Bessel's formula to find the value of $f(27.5)$ from the table:

x :	25	26	27	28	29	30	
$f(x)$:	4.000	3.846	3.704	3.571	3.448	3.333	(U.P.T.U., 2009)

Solution. Taking the origin at $x_0 = 27$, $h = 1$, we have $p = x - 27$

The central difference table is

x	p	y	Δy	$\Delta^2 y$	$\Delta^3 y$	$\Delta^4 y$
25	-2	4.000		-0.154		
26	-1	3.846	-0.154	-0.142	0.012	-0.003
27	0	3.704	-0.142	-0.133	0.009	-0.001
28	1	3.571	-0.133	-0.123	0.010	-0.002
29	2	3.448	-0.123	-0.115	0.008	-0.001
30	3	3.333				

At $x = 27.5, p = 0.5$ (As p lies between $1/4$ and $3/4$, the use of Bessel's formula will yield accurate result)
Bessel's formula is

$$\begin{aligned} y_p &= y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \left(\frac{\Delta^2 y_{-1} + \Delta^2 y_0}{2} \right) + \frac{\left(p - \frac{1}{2} \right) p(p-1)}{3!} \Delta^3 y_{-1} \\ &\quad + \frac{(p+1)p(p-1)(p-2)}{4!} \left(\frac{\Delta^4 y_{-2} + \Delta^4 y_{-1}}{2} \right) + \dots \end{aligned}$$

When $p = 0.5$, we have

$$\begin{aligned} y_p &= 3.704 - \frac{(0.5)(0.5-1)}{2} \left(\frac{0.009 + 0.010}{2} \right) + 0 \\ &\quad + \frac{(0.5+1)(0.5)(0.5-1)(0.5-2)}{24} \left(\frac{-0.001 - 0.004}{2} \right) \\ &= 3.704 - 0.11875 - 0.00006 = 3.585 \end{aligned}$$

Hence $f(27.5) = 3.585$.

Example 29.24. Given the table

x	310	320	330	340	350	360
$\log x$	2.49136	2.50515	2.51851	2.53148	2.54407	2.55630

find the value of $\log 337.5$ by Everett's formula.

Solution. Taking the origin at $x_0 = 330$ and $h = 10$, we have $p = \frac{x - 330}{10}$

∴ The central difference table is

p	y	Δy	$\Delta^2 y$	$\Delta^3 y$	$\Delta^4 y$	$\Delta^5 y$
-2	2.49136					
-1	2.50515	0.01379				
0	2.51851	0.01336	-0.00043	0.00004	-0.00003	
1	2.53148	0.01297	-0.00039	0.00001	0.00001	0.00004
2	2.54407	0.01259	-0.00038	0.00002		
3	2.55630	0.01223	-0.00036			

To evaluate $\log 337.5$ i.e. for $x = 337.5, p = \frac{337.5 - 330}{10} = 0.75$

(As $p > 0.5$ and = 0.75, Everett's formula will be quite suitable)

Everett's formula is

$$\begin{aligned} y_p &= qy_0 + \frac{q(q^2 - 1^2)}{3!} \Delta^2 y_{-1} + \frac{q(q^2 - 1^2)(q^2 - 2^2)}{5!} \Delta^4 y_{-2} + \dots + py_1 + \frac{p(p^2 - 1^2)}{3!} \Delta^2 y_0 \\ &\quad + \frac{p(p^2 - 1^2)(p^2 - 2^2)}{5!} \Delta^4 y_{-1} + \dots \\ &= 0.25 \times 2.51851 + \frac{0.25(0.0625 - 1)}{6} \times (-0.00039) + \frac{0.25(0.0625 - 1)(0.0625 - 4)}{120} \\ &\quad \times (-0.00003) + 0.75 \times 2.53148 + \frac{0.75(0.5625 - 1)}{6} \times (-0.00038) \\ &\quad + \frac{0.75(0.5625 - 1)(0.5625 - 4)}{120} \times (0.00001) \\ &= 0.62963 + 0.00002 - 0.0000002 + 1.89861 + 0.00002 + 0.0000001 = 2.52828 \text{ nearly.} \end{aligned}$$

PROBLEMS 29.4

1. Using Gauss's forward formula, evaluate $f(3.75)$ from the table :

$x:$	2.5	3.0	3.5	4.0	4.5	5.0	
$y:$	24.145	22.043	20.225	18.644	17.262	16.047	(Bhopal, 2002; Madras, 2000)

2. Using Gauss's backward difference formula, find $y(8)$ from the following table :

$x:$	0	5	10	15	20	25	
$y:$	7	11	14	18	24	32	(J.N.T.U., 2007)

3. Using Gauss's backward formula, estimate the number of persons earning wages between Rs. 60 and Rs. 70 from the following data :

Wages (₹)	Below 40	40-60	60-80	80-100	100-120	
No. of persons : (in thousands)	250	120	100	70	50	(Madras, 2000)

4. From the following table :

$x:$	1.00	1.05	1.10	1.15	1.20	1.25	1.30
$e^x:$	2.7183	2.8577	3.0042	3.1582	3.3201	3.4903	3.6693

Find $e^{1.17}$, using Gauss forward formula.

5. The pressure p of wind corresponding to velocity v is given by the following data. Estimate p when $v = 25$.

$v:$	10	20	30	40
$p:$	1.1	2	4.4	7.9

6. Using Stirling's formula find y_{35} , given $y_{20} = 512$, $y_{30} = 439$, $y_{40} = 346$, $y_{50} = 243$,

where y_x represents the number of persons at age x years in a life table. (Nagpur, 2003 S)

7. Employ Bessel's formula to find the value of F at $x = 1.95$, given that

$x:$	1.7	1.8	1.9	2.0	2.1	2.2	2.3
$F:$	2.979	3.144	3.283	3.391	3.463	3.997	4.491

Which other interpolation formula can be used here? Which is more appropriate? Give reasons.

8. Calculate the value of $f(1.5)$ using Bessel's interpolation formula, from the following table :

$x:$	0	1	2	3		
$f(x):$	3	6	12	15		(U.P.T.U., 2008)

9. Apply Everett's formula to obtain u_{25} , given $u_{20} = 854$, $u_{24} = 3162$, $u_{28} = 3544$, $u_{32} = 3992$. (S.V.T.U., 2007)

10. Using Everett's formula, evaluate $f(30)$, if $f(20) = 2854$, $f(28) = 3162$, $f(36) = 7088$, $f(44) = 7984$. (U.P.T.U., 2006)

11. Given the table :

$x:$	310	320	330	340	350	360	
$\log x:$	2.4914	2.5052	2.5185	2.5315	2.5441	2.5563	

Find the value of $\log 337.5$ by Gauss's, Stirling's and Bessel's formulae.

29.9 INTERPOLATION WITH UNEQUAL INTERVALS

The various interpolation formulae derived so far possess the disadvantages of being applicable only to equally spaced values of the argument. It is, therefore, desirable to develop interpolation formulae for unequally spaced values of x . Now we shall study two such formulae :

(i) Lagrange's interpolation formula

(ii) Newton's general interpolation formula with divided differences.

29.10 LAGRANGE'S INTERPOLATION FORMULA

If $y = f(x)$ takes the value y_0, y_1, \dots, y_n corresponding to $x = x_0, x_1, \dots, x_n$, then

$$f(x) = \frac{(x - x_1)(x - x_2) \dots (x - x_n)}{(x_0 - x_1)(x_0 - x_2) \dots (x_0 - x_n)} y_0 + \frac{(x - x_0)(x - x_2) \dots (x - x_n)}{(x_1 - x_0)(x_1 - x_2) \dots (x_1 - x_n)} y_1 + \dots + \frac{(x - x_0)(x - x_1) \dots (x - x_{n-1})}{(x_n - x_0)(x_n - x_1) \dots (x_n - x_{n-1})} y_n \quad \dots(1)$$

This is known as Lagrange's interpolation formula for unequal intervals.

Proof. Let $y = f(x)$ be a function which takes the values $(x_0, y_0), (x_1, y_1), \dots, (x_n, y_n)$. Since there are $n + 1$ pairs of values of x and y , we can represent $f(x)$ by a polynomial in x of degree n . Let this polynomial be of the form

$$\begin{aligned} y = f(x) &= a_0(x - x_1)(x - x_2)\dots(x - x_n) + a_1(x - x_0)(x - x_2)\dots(x - x_n) \\ &\quad + a_2(x - x_0)(x - x_1)(x - x_3)\dots(x - x_n) + \dots + a_n(x - x_0)(x - x_1)\dots(x - x_{n-1}) \end{aligned} \quad \dots(2)$$

Putting $x = x_0, y = y_0$, in (2), we get

$$\begin{aligned} y_0 &= a_0(x_0 - x_1)(x_0 - x_2)\dots(x_0 - x_n) \\ a_0 &= y_0 / [(x_0 - x_1)(x_0 - x_2)\dots(x_0 - x_n)] \end{aligned}$$

Similarly putting $x = x_1, y = y_1$ in (2), we have $a_1 = y_1 / [(x_1 - x_0)(x_1 - x_2)\dots(x_1 - x_n)]$

Proceeding the same way, we find a_2, a_3, \dots, a_n

Substituting the values of a_0, a_1, \dots, a_n in (2), we get (1).

Obs. Lagrange's interpolation formula (1) for n points is a polynomial of degree $(n - 1)$ which is known as **Lagrangian polynomial** and is very simple to implement on a computer.

This formula can also be used to split the given function into partial fractions.

For on dividing both sides of (1) by $(x - x_0)(x - x_1)\dots(x - x_n)$, we get

$$\begin{aligned} \frac{f(x)}{(x_0 - x_0)(x_0 - x_1)\dots(x_0 - x_n)} &= \frac{y_0}{(x_0 - x_1)(x_0 - x_2)\dots(x_0 - x_n)} \cdot \frac{1}{x - x_0} \\ &\quad + \frac{y_1}{(x_1 - x_0)(x_1 - x_2)\dots(x_1 - x_n)} \cdot \frac{1}{x - x_1} + \dots + \frac{y_n}{(x_n - x_0)(x_n - x_1)\dots(x_n - x_{n-1})} \cdot \frac{1}{x - x_n}. \end{aligned}$$

Example 29.25. Given the values

$x :$	5	7	11	13	17
$f(x) :$	150	392	1492	2366	5202

evaluate $f(9)$, using (i) Lagrange's formula.

(Anna, 2006)

Solution. (i) Here $x_0 = 5, x_1 = 7, x_2 = 11, x_3 = 13, x_4 = 17$

and $y_0 = 150, y_1 = 392, y_2 = 1452, y_3 = 2366, y_4 = 5202$.

Putting $x = 9$ and substituting the above values in Lagrange's formula, we get

$$\begin{aligned} f(9) &= \frac{(9 - 7)(9 - 11)(9 - 13)(9 - 17)}{(5 - 7)(5 - 11)(5 - 13)(5 - 17)} \times 150 + \frac{(9 - 5)(9 - 11)(9 - 13)(9 - 17)}{(7 - 5)(7 - 11)(7 - 13)(7 - 17)} \times 392 \\ &\quad + \frac{(9 - 5)(9 - 7)(9 - 13)(9 - 17)}{(11 - 5)(11 - 7)(11 - 13)(11 - 17)} \times 1452 + \frac{(9 - 5)(9 - 7)(9 - 11)(9 - 17)}{(13 - 5)(13 - 7)(13 - 11)(13 - 17)} \times 2366 \\ &\quad + \frac{(9 - 5)(9 - 7)(9 - 11)(9 - 13)}{(17 - 5)(17 - 7)(17 - 11)(17 - 13)} \times 5202 = -\frac{50}{3} + \frac{3136}{15} + \frac{3872}{3} - \frac{2366}{3} + \frac{578}{5} = 810. \end{aligned}$$

Example 29.26. Find the polynomial $f(x)$ by using Lagrange's formula and hence find $f(3)$ for

$x :$	0	1	2	5
$f(x) :$	2	3	12	147

(Anna, 2005)

Solution. Here $x_0 = 0, x_1 = 2, x_2 = 5$

and $y_0 = 2, y_1 = 3, y_2 = 12, y_3 = 147$

Lagrange's formula is

$$\begin{aligned} y &= \frac{(x - x_1)(x - x_2)\dots(x - x_3)}{(x_0 - x_1)(x_0 - x_2)\dots(x_0 - x_3)} y_0 + \frac{(x - x_0)(x - x_2)\dots(x - x_3)}{(x_1 - x_0)(x_1 - x_2)\dots(x_1 - x_3)} y_1 \\ &\quad + \frac{(x - x_0)(x - x_1)\dots(x - x_3)}{(x_2 - x_0)(x_2 - x_1)\dots(x_2 - x_3)} y_2 + \frac{(x - x_0)(x - x_2)\dots(x - x_5)}{(x_3 - x_0)(x_3 - x_2)\dots(x_3 - x_5)} y_3 \\ &= \frac{(x - 1)(x - 2)(x - 5)}{(0 - 1)(0 - 2)(0 - 5)} (2) + \frac{(x - 0)(x - 2)(x - 5)}{(1 - 0)(1 - 2)(1 - 5)} (3) \\ &\quad + \frac{(x - 0)(x - 1)(x - 5)}{(2 - 0)(2 - 1)(2 - 5)} (12) + \frac{(x - 0)(x - 1)(x - 2)}{(5 - 0)(5 - 1)(5 - 2)} (147) \end{aligned}$$

Hence $f(x) = x^3 + x^2 - x + 2$
 $\therefore f(3) = 27 + 9 - 3 + 2 = 35.$

Example 29.27. A curve passes through the point $(0, 18)$, $(1, 10)$, $(3, -18)$ and $(6, 90)$. Find the slope of the curve at $x = 2$. (J.N.T.U., 2009)

Solution. Here $x_0 = 0$, $x_1 = 1$, $x_2 = 3$, $x_3 = 6$ and $y_0 = 18$, $y_1 = 10$, $y_2 = -18$, $y_3 = 90$

Since the values of x are unequally spaced, we use the Lagrange's formula :

$$\begin{aligned} y &= \frac{(x - x_1)(x - x_2)(x - x_3)}{(x_0 - x_1)(x_0 - x_2)(x_0 - x_3)} y_0 + \frac{(x - x_0)(x - x_2)(x - x_3)}{(x_1 - x_0)(x_1 - x_2)(x_1 - x_3)} y_1 \\ &\quad + \frac{(x - x_0)(x - x_1)(x - x_3)}{(x_2 - x_0)(x_2 - x_1)(x_2 - x_3)} y_2 + \frac{(x - x_0)(x - x_1)(x - x_2)}{(x_3 - x_0)(x_3 - x_1)(x_3 - x_2)} y_3 \\ &= \frac{(x - 1)(x - 3)(x - 6)}{(0 - 1)(0 - 2)(0 - 6)} (18) + \frac{(x - 0)(x - 3)(x - 6)}{(1 - 0)(1 - 3)(1 - 6)} (10) \\ &\quad + \frac{(x - 0)(x - 1)(x - 6)}{(3 - 0)(3 - 1)(3 - 6)} (-18) + \frac{(x - 0)(x - 1)(x - 3)}{(6 - 0)(6 - 1)(6 - 3)} (90) \\ &= (-x^3 + 10x^2 - 27x + 18) + (x^3 - 9x^2 + 18x) + (x^3 - 7x^2 + 6x) + (x^3 - 4x^2 + 3x) \end{aligned}$$

i.e., $y = 2x^3 - 10x^2 + 18$

Thus the slope of the curve at $(x = 2) = \left(\frac{dy}{dx}\right)_{x=2}$
 $= (6x^2 - 20x)_{x=2} = -16.$

Example 29.28. Using Lagrange's formula, express the function $\frac{3x^2 + x + 1}{(x - 1)(x - 2)(x - 3)}$ as a sum of partial fractions.

Solution. Let us evaluate $y = 3x^2 + x + 1$ for $x = 1$, $x = 2$ and $x = 3$

These values are

$x :$	$x_0 = 1$	$x_1 = 2$	$x_2 = 3$
$y :$	$y_0 = 5$	$y_1 = 15$	$y_2 = 31$

Lagrange's formula is

$$\begin{aligned} y &= \frac{(x - x_1)(x - x_2)}{(x_0 - x_1)(x_0 - x_2)} y_0 + \frac{(x - x_0)(x - x_2)}{(x_1 - x_0)(x_1 - x_2)} y_1 + \frac{(x - x_0)(x - x_1)}{(x_2 - x_0)(x_2 - x_1)} y_2 \\ &= \frac{(x - 1)(x - 2)}{(0 - 1)(0 - 2)} (5) + \frac{(x - 1)(x - 3)}{(2 - 1)(2 - 3)} (15) + \frac{(x - 1)(x - 2)}{(3 - 1)(3 - 2)} (31) \end{aligned}$$

Substituting the above values, we get

$$\begin{aligned} &= \frac{(x - 2)(x - 3)}{(1 - 2)(1 - 3)} (5) + \frac{(x - 1)(x - 3)}{(2 - 1)(2 - 3)} (15) + \frac{(x - 1)(x - 2)}{(3 - 1)(3 - 2)} (31) \\ &= 2.5(x - 2)(x - 3) - 15(x - 1)(x - 3) + 15.5(x - 1)(x - 2) \end{aligned}$$

Thus $\frac{3x^2 + x + 1}{(x - 1)(x - 2)(x - 3)} = \frac{2.5(x - 2)(x - 3) - 15(x - 1)(x - 3) + 15.5(x - 1)(x - 2)}{(x - 1)(x - 2)(x - 3)}$
 $= \frac{2.5}{x - 1} - \frac{15}{x - 2} + \frac{15.5}{x - 3}.$

Example 29.29. Find the distance moved by a particle and its acceleration at the end of 4 seconds, if the time versus velocity data is as follows :

$t :$	0	1	3	4
$v :$	21	15	12	10

Solution. Since the values of t are not equispaced, we use Lagrange's formula :

$$v = \frac{(t-t_1)(t-t_2)(t-t_3)}{(t_0-t_1)(t_0-t_2)(t_0-t_3)} v_0 + \frac{(t-t_0)(t-t_2)(t-t_3)}{(t_1-t_0)(t_1-t_2)(t_1-t_3)} v_1 \\ + \frac{(t-t_0)(t-t_1)(t-t_3)}{(t_2-t_0)(t_2-t_1)(t_2-t_3)} v_2 + \frac{(t-t_0)(t-t_2)(t-t_5)}{(t_3-t_0)(t_3-t_2)(t_3-t_5)} v_3 \\ v = \frac{(t-1)(t-3)(t-4)}{(-1)(-2)(-4)} (21) + \frac{t(t-3)(t-4)}{(1)(-2)(-3)} (15) + \frac{t(t-1)(t-4)}{(3)(2)(-1)} (12) + \frac{t(t-1)(t-3)}{(4)(3)(1)} (10)$$

i.e.,

$$v = \frac{1}{12} (-5t^3 + 38t^2 - 105t + 252)$$

$$\therefore \text{Distance moved } s = \int_0^4 v dt = \frac{1}{12} \int_0^4 (-5t^3 + 38t^2 - 105t + 252) dt \\ = \frac{1}{12} \left(-\frac{5t^4}{4} + \frac{38t^3}{3} - \frac{105t^2}{2} + 252t \right)_0^4 \\ = \frac{1}{12} \left(-320 + \frac{2432}{3} - 840 + 1008 \right) = 54.9$$

$$\text{Also acceleration } = \frac{dv}{dt} = \frac{1}{2} (-15t^2 + 76t - 105 + 0)$$

$$\text{Hence acceleration at } (t=4) = \frac{1}{12} (-15(16) + 76(4) - 105) = -3.4.$$

$$\left[\because v = \frac{ds}{dt} \right]$$

PROBLEMS 29.5

1. Use Lagrange's interpolation formula to find the value of y when $x = 10$, if the following values of x and y are given :

x :	5	6	9	11
y :	12	13	14	16

(U.P.T.U., 2009; J.N.T.U., 2008)

2. Given $\log_{10} 654 = 2.8156$, $\log_{10} 658 = 2.8182$, $\log_{10} 659 = 2.8189$, $\log_{10} 661 = 2.8202$, find by using Lagrange's formula, the value of $\log_{10} 656$. (Hazaribagh, 2009)

3. The following are the measurements T made on a curve recorded by oscilograph representing a change of current I due to a change in the conditions of an electric current.

T :	1.2	2.0	2.5	3.0
I :	1.36	0.58	0.34	0.20

Using Lagrange's formula, find I at $T = 1.6$.

(J.N.T.U., 2009)

4. Using Lagrange's interpolation, calculate the profit in the year 2000 from the following data :

Year	:	1997	1999	2001	2002
Profit in Lakhs of ₹	:	43	65	159	248

(Anna, 2004)

5. Use Lagrange's formula to find the form of $f(x)$, given

x :	0	2	3	6
$f(x)$:	648	704	729	792

(Madras, 2003 S)

6. If $y(1) = -3$, $y(3) = 9$, $y(4) = 30$, $y(6) = 132$, find the Lagrange's interpolation polynomial that takes the same values as y at the given points. (V.T.U., 2006)

7. Given $f(0) = -18$, $f(1) = 0$, $f(3) = 0$, $f(5) = -248$, $f(6) = 0$, $f(9) = 13104$, find $f(x)$.

(Nagarjuna, 2003)

8. Find the missing term in the following table using interpolation.

x :	1	2	4	5	6
y :	14	15	5	...	9

9. Using Lagrange's formula, express the function $\frac{x^2 + x - 3}{x^3 - 2x^2 - x + 2}$ as sum of partial fractions.

29.11 DIVIDED DIFFERENCES

The Lagrange's formula has the drawback that if another interpolation value were inserted, then the interpolation coefficients are required to be recalculated. The labour of recomputing the interpolation

coefficients is saved by using Newton's general interpolation formula which employs what are called 'divided differences'. Before deriving this formula, we shall first define these differences.

If $(x_0, y_0), (x_1, y_1), (x_2, y_2), \dots$ be given points, then the *first divided difference* for the arguments, x_0, x_1 is defined by the relation $[x_0, x_1] = \frac{y_1 - y_0}{x_1 - x_0}$.

Similarly $[x_1, x_2] = \frac{y_2 - y_1}{x_2 - x_1}$ and $[x_2, x_3] = \frac{y_3 - y_2}{x_3 - x_2}$ etc.

The *second divided difference* for x_0, x_1, x_2 is defined as $[x_0, x_1, x_2] = \frac{[x_1 - x_2] - [x_0, x_1]}{x_2 - x_0}$

The *third divided difference* for x_0, x_1, x_2, x_3 is defined as

$$[x_0, x_1, x_2, x_3] = \frac{[x_1, x_2, x_3] - [x_0, x_1, x_2]}{x_3 - x_0} \text{ and so on.}$$

Obs. 1. The divided differences are symmetrical in their arguments i.e. independent of the order of the arguments.

$$\begin{aligned} \text{For it is easy to write } [x_0, x_1] &= \frac{y_1}{x_1 - x_0} + \frac{y_0}{x_0 - x_1} = [x_1, x_0] [x_0, x_1, x_2] \\ &= \frac{y_0}{(x_0 - x_1)(x_0 - x_2)} + \frac{y_1}{(x_1 - x_0)(x_1 - x_2)} + \frac{y_2}{(x_2 - x_0)(x_2 - x_1)} \\ &= [x_1, x_2, x_0] \text{ or } [x_2, x_0, x_1] \text{ and so on.} \end{aligned}$$

Obs. 2. The n th divided differences of a polynomial of the n th degree are constant.

Let the arguments be equally spaced so that, $x_1 - x_0 = x_2 - x_1 = \dots = x_n - x_{n-1} = h$. Then

$$\begin{aligned} [x_0, x_1] &= \frac{y_1 - y_0}{x_1 - x_0} = \frac{\Delta y_0}{h} \\ [x_0, x_1, x_2] &= \frac{[x_1, x_2] - [x_0, x_1]}{x_2 - x_0} = \frac{1}{2h} \left[\frac{\Delta y_1}{h} - \frac{\Delta y_0}{h} \right] \\ &= \frac{1}{2!h^2} \Delta^2 y_0 \text{ and in general, } [x_0, x_1, x_2, \dots, x_n] = \frac{1}{n!h^n} \Delta^n y_0. \end{aligned}$$

If the tabulated function is a n th degree polynomial, then $\Delta^n y_0$ will be constant. Hence the n th divided differences will also be constant.

29.12 NEWTON'S DIVIDED DIFFERENCE FORMULA

Let y_0, y_1, \dots, y_n be the values of $y = f(x)$ corresponding to the arguments x_0, x_1, \dots, x_n . Then from the definition of divided differences, we have

$$[x, x_0] = \frac{y - y_0}{x - x_0}$$

so that

$$y = y_0 + (x - x_0) [x, x_0] \quad \dots(1)$$

$$\text{Again } [x, x_0, x_1] = \frac{[x, x_0] - [x_0, x_1]}{x - x_1}$$

which gives

$$[x, x_0] = [x_0, x_1] + (x - x_1) [x, x_0, x_1]$$

Substituting this value of $[x, x_0]$ in (1), we get

$$y = y_0 + (x - x_0) [x_0, x_1] + (x - x_0)(x - x_1) [x, x_0, x_1] \quad \dots(2)$$

$$\text{Also } [x, x_0, x_1, x_2] = \frac{[x, x_0, x_1] - [x_0, x_1, x_2]}{x - x_2}$$

which gives $[x, x_0, x_1] = [x_0, x_1, x_2] + (x - x_2) [x, x_0, x_1, x_2]$

Substituting this value of $[x, x_0, x_1]$ in (2), we obtain

$$y = y_0 + (x - x_0) [x_0, x_1] + (x - x_0)(x - x_1) [x_0, x_1, x_2] + (x - x_0)(x - x_1)(x - x_2) [x, x_0, x_1, x_2]$$

Proceeding in this manner, we get

$$y = f(x) = y_0 + (x - x_0) [x_0, x_1] + (x - x_0)(x - x_1) [x_0, x_1, x_2] \\ + (x - x_0)(x - x_1)(x - x_2) [x_0, x_1, x_2, x_3] + \dots \\ + (x - x_0)(x - x_1) \dots (x - x_n) [x, x_0, x_1, \dots, x_n] \quad \dots(3)$$

which is called *Newton's general interpolation formula with divided differences*.

Example 29.30. Given the values

$x :$	5	7	11	13	17
$f(x) :$	150	392	1452	2366	5202

evaluate $f(9)$, using Newton's divided difference formula.

(V.T.U., 2010; P.T.U., 2005)

Solution. The divided difference table is

x	y	1st divided differences	2nd divided differences	3rd divided differences
5	150			
7	392	$\frac{392 - 150}{7 - 5} = 121$	$\frac{265 - 121}{11 - 5} = 24$	
11	1452	$\frac{1452 - 392}{11 - 7} = 265$	$\frac{457 - 265}{13 - 7} = 32$	$\frac{32 - 24}{13 - 5} = 1$
13	2366	$\frac{2366 - 1452}{13 - 11} = 457$	$\frac{709 - 457}{17 - 11} = 42$	$\frac{42 - 32}{17 - 7} = 1$
17	5202	$\frac{5202 - 2366}{17 - 13} = 709$		

Taking $x = 9$ in the Newton's divided difference formula, we obtain

$$f(9) = 150 + (9 - 5) \times 121 + (9 - 5)(9 - 7) \times 24 + (9 - 5)(9 - 7)(9 - 11) \times 1 \\ = 150 + 484 + 192 - 16 = 810.$$

Example 29.31. Determine $f(x)$ as a polynomial in x for the following data :

$x :$	-4	-1	0	2	5
$f(x) :$	1245	33	5	9	1335

(V.T.U., 2007)

Solution. The divided differences table is

x	$f(x)$	1st divided differences	2nd divided differences	3rd divided differences	4th divided differences
-4	1245	-404			
-1	33	-28	94	-14	
0	5	2	10	13	3
2	9	442	88		
5	1335				

Applying Newton's divided difference formula

$$\begin{aligned} f(x) &= f(x_0) + (x - x_0) [x_0, x_1] + (x - x_0)(x - x_1) [x_0, x_1, x_2] + \dots \\ &= 1245 + (x + 4)(-404) + (x + 4)(x + 1)(94) \\ &\quad + (x + 4)(x + 1)(x - 0)(-14) + (x + 4)(x + 1)x(x - 2) (3) \\ &= 3x^4 - 5x^3 + 6x^2 - 14x + 5. \end{aligned}$$

PROBLEMS 29.6

- Find the third divided difference with arguments 2, 4, 9, 10 of the function $f(x) = x^3 - 2x$. (U.P.T.U., 2005)
- Use Newton's divided difference method to compute $f(5.5)$ from the following data:

x	: 0	1	4	5	6
$f(x)$: 1	14	15	6	3

 (U.P.T.U., 2010)
- Using Newton's divided difference formula, evaluate $f(8)$ and $f(15)$ given:

x	: 4	5	7	10	11	13
$f(x)$: 48	100	294	900	1210	2028

 (U.P.T.U., MCA, 2009, V.T.U., 2008)
- Obtain the Newton's divided difference interpolation polynomial and hence find $f(6)$:

x	: 3	7	9	10
$f(x)$: 168	120	72	63

 (U.P.T.U., 2007)
- Using Newton's divided difference interpolation, find the polynomial of the given data:

x	: -1	0	1	3
$f(x)$: 2	1	0	-1

 (Anna, 2007)
- For the following table, find $f(x)$ as a polynomial in x using Newton's divided difference formula:

x	: 5	6	9	11
$f(x)$: 12	13	14	16
- Using the following table, find $f(x)$ as a polynomial in

x	: -1	0	3	6	7
$f(x)$: 3	-6	39	822	1611

 (U.P.T.U., 2009)
- Find the missing term in the following table using Newton's divided difference formula

x :	0	1	2	3	4
y :	1	3	9	...	81

29.13 INVERSE INTERPOLATION

So far, given a set of values of x and y , we have been finding the values of y corresponding to a certain value of x . On the other hand, the process of estimating the value of x for a value of y (which is not in the table) is called the *inverse interpolation*.

Lagrange's formula is merely a relation between two variables either of which may be taken as the independent variable. Therefore, on inter-changing x and y in the Lagrange's formula, we obtain

$$\begin{aligned} x &= \frac{(y - y_1)(y - y_2) \dots (y - y_n)}{(y_0 - y_1)(y_0 - y_2) \dots (y_0 - y_n)} x_0 + \frac{(y - y_0)(y - y_2) \dots (y - y_n)}{(y_1 - y_0)(y_1 - y_2) \dots (y_1 - y_n)} x_1 \\ &\quad + \dots + \frac{(y - y_0)(y - y_1) \dots (y - y_{n-1})}{(y_n - y_0)(y_n - y_1) \dots (y_n - y_{n-1})} x_n \dots (1) \end{aligned}$$

which is used for inverse interpolation.

Example 29.32. The following table gives the values of x and y :

x :	1.2	2.1	2.8	4.1	4.9	6.2
y :	4.2	6.8	9.8	13.4	15.5	19.6

Find the value of x corresponding to $y = 12$, using Lagrange's technique.

(V.T.U., 2009)

Solution. Here $x_0 = 1.2, x_1 = 2.1, x_2 = 2.8, x_3 = 4.1, x_4 = 4.9, x_5 = 6.2$

and $y_0 = 4.2, y_1 = 6.8, y_2 = 9.8, y_3 = 13.4, y_4 = 15.5, y_5 = 19.6$

Taking $y = 12$, the above formula (1) gives

$$\begin{aligned}
 x &= \frac{(12 - 6.8)(12 - 9.8)(12 - 13.4)(12 - 15.5)(12 - 19.6)}{(4.2 - 6.8)(4.2 - 9.8)(4.2 - 13.4)(4.2 - 15.5)(4.2 - 19.6)} \times 1.2 \\
 &\quad + \frac{(12 - 4.2)(12 - 9.8)(12 - 13.4)(12 - 15.5)(12 - 19.6)}{(6.8 - 4.2)(6.8 - 9.8)(6.8 - 13.4)(6.8 - 15.5)(6.8 - 19.6)} \times 2.1 \\
 &\quad + \frac{(12 - 4.2)(12 - 6.8)(12 - 13.4)(12 - 15.5)(12 - 19.6)}{(9.8 - 4.2)(9.8 - 6.8)(9.8 - 13.4)(9.8 - 15.5)(9.8 - 19.6)} \times 2.8 \\
 &\quad + \frac{(12 - 4.2)(12 - 6.8)(12 - 9.8)(12 - 15.5)(12 - 19.6)}{(13.4 - 4.2)(13.4 - 6.8)(13.4 - 9.8)(13.4 - 15.5)(13.4 - 19.6)} \times 4.1 \\
 &\quad + \frac{(12 - 4.2)(12 - 6.8)(12 - 9.8)(12 - 13.4)(12 - 19.6)}{(15.5 - 4.2)(15.5 - 6.8)(15.5 - 9.8)(15.5 - 13.4)(15.5 - 19.6)} \times 4.9 \\
 &\quad + \frac{(12 - 4.2)(12 - 6.8)(12 - 9.8)(12 - 13.4)(12 - 15.5)}{(19.6 - 4.2)(19.6 - 6.8)(19.6 - 9.8)(19.6 - 13.4)(19.6 - 15.5)} \times 6.2 \\
 &= 0.022 - 0.234 + 1.252 + 3.419 - 0.964 + 0.055 = 3.55.
 \end{aligned}$$

Example 29.33. Apply Lagrange's formula inversely to obtain a root of the equation $f(x) = 0$, given that $f(30) = -30$, $f(34) = -13$, $f(38) = 3$, and $f(42) = 18$. (V.T.U., 2009 S)

Solution. Here $x_0 = 30$, $x_1 = 34$, $x_2 = 38$, $x_3 = 42$
and $y_0 = -30$, $y_1 = -13$, $y_2 = 3$, $y_3 = 18$

It is required to find x corresponding to $y = f(x) = 0$.

Taking $y = 0$, the Lagrange's formula gives,

$$\begin{aligned}
 x &= \frac{(y - y_1)(y - y_2)(y - y_3)}{(y_0 - y_1)(y_0 - y_2)(y_0 - y_3)} x_0 + \frac{(y - y_0)(y - y_2)(y - y_3)}{(y_1 - y_0)(y - y_2)(y_1 - y_3)} x_1 \\
 &\quad + \frac{(y - y_0)(y - y_1)(y - y_3)}{(y_2 - y_0)(y_2 - y_1)(y_2 - y_3)} x_2 + \frac{(y - y_0)(y - y_1)(y - y_2)}{(y_3 - y_0)(y_3 - y_1)(y_3 - y_2)} x_3 \\
 &= \frac{13(-3)(-18)}{(-17)(-33)(-48)} \times 30 + \frac{30(-3)(-18)}{17(-16)(-31)} \times 34 + \frac{30(13)(-18)}{33(16)(-15)} \times 38 + \frac{30(13)(-3)}{48(31)(15)} \times 42 \\
 &= -0.782 + 6.532 + 33.682 - 2.202 = 37.23
 \end{aligned}$$

Hence the desired root of $f(x) = 0$ is 37.23.

PROBLEMS 29.7

1. Apply Lagrange's method to find the value of x when $f(x) = 15$ from the given data :

x :	5	6	9	11
$f(x)$:	12	13	14	16

(Madras, 2000)

2. Obtain the value of t when $A = 85$ from the following table, using Lagrange's method :

t :	2	5	8	14
A :	94.8	87.9	81.3	68.7

29.14 OBJECTIVE TYPE OF QUESTIONS

PROBLEMS 29.8

Select the correct answer or fill up the blanks in the following problems :

- Newton's backward interpolation formula is
- Bessel's formula is most appropriate when p lies between
 (a) -0.25 and 0.25 (b) 0.25 and 0.75 (c) 0.75 and 1.00.

3. From the divided difference table for the following data :

$x :$	5	15	22
$y :$	7	36	160

4. Interpolation is the technique of estimating the value of a function for any

5. Bessel's formula for interpolation is

6. The 4th divided differences for $x_0, x_1, x_2, x_3, x_4 = \dots$.

7. Stirling's formula is best suited for p lying between

8. Newton's divided differences formula is

9. Given $(x_0, y_0), (x_1, y_1), (x_2, y_2)$, Lagrange's interpolation formula is

10. If $f(0) = 1, f(2) = 5, f(3) = 10$ and $f(x) = 14$, then $x = 0$

11. Gauss forward interpolation formula involves:

- (a) even differences above the central line and odd differences on the central line
- (b) even differences below the central line and odd differences on the central line
- (c) odd differences below the central line and even differences on the central line
- (d) odd differences above the central line and even differences on the central line.

12. If $y(1) = 4, y(3) = 12, y(4) = 19$ and $y(x) = 7$ find x using Lagrange's formula.

13. Extrapolation is defined as

14. The second divided difference of $f(x) = 1/x$, with arguments, a, b, c , is.....

(Anna, 2007)

15. Gauss-forward interpolation formula is used to interpolate values of y for

- | | |
|-----------------------|-------------------------|
| (a) $0 < p < 1$ | (b) $-1 < p < 0$ |
| (c) $0 < p < -\alpha$ | (d) $-\alpha < p < 0$. |

16. Given

$x :$	0	1	3	4
$y :$	-12	0	6	12

Using Lagrange's formula, a polynomial that can be fitted to the data is

17. The n th divided difference of a polynomial of degree n is

- | | |
|----------------|--------------------|
| (a) zero | (b) a constant |
| (c) a variable | (d) none of these. |

18. If h is the interval of differencing, $\Delta^2 x^3 = \dots$.

30.1 NUMERICAL DIFFERENTIATION

It is the process of calculating the value of the derivative of a function at some assigned value of x from the given set of values (x_i, y_i) . To compute dy/dx , we first replace the latter as many times as we desire. The choice of the interpolation formula to be used, will depend on the assigned value of x at which dy/dx is desired.

If the values of x are equi-spaced and dy/dx is required near the beginning of the table, we employ Newton's forward formula. If it is required near the end of the table, we use Newton's backward formula. For values near the middle of the table, dy/dx is calculated by means of Stirling's or Bessel's formula. If the values of x are not equi-spaced, we use Newton's divided difference formula to represent the function.

30.2 FORMULAE FOR DERIVATIVES

Consider the function $y = f(x)$ which is tabulated for the values x_i ($= x_0 + ih$), $i = 0, 1, 2, \dots, n$.

(1) Derivatives using forward difference formula. Newton's forward interpolation formula (p. 958) is

$$y = y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \Delta^2 y_0 + \frac{p(p-1)(p-2)}{3!} \Delta^3 y_0 + \dots$$

Differentiating both sides w.r.t. p , we have

$$\frac{dy}{dp} = \Delta y_0 + \frac{2p-1}{2!} \Delta^2 y_0 + \frac{3p^2 - 6p + 2}{3!} \Delta^3 y_0 + \dots$$

Since $p = \frac{(x - x_0)}{h}$, therefore $\frac{dp}{dx} = \frac{1}{h}$.

$$\text{Now } \frac{dy}{dx} = \frac{dy}{dp} \cdot \frac{dp}{dx} = \frac{1}{h} \left[\Delta y_0 + \frac{2p-1}{2!} \Delta^2 y_0 + \frac{3p^2 - 6p + 2}{3!} \Delta^3 y_0 + \dots + \frac{4p^3 - 18p^2 + 22p - 6}{4!} \Delta^4 y_0 + \dots \right] \quad \dots(1)$$

At $x = x_0$, $p = 0$. Hence putting $p = 0$,

$$\left(\frac{dy}{dx} \right)_{x_0} = \frac{1}{h} \left[\Delta y_0 - \frac{1}{2} \Delta^2 y_0 + \frac{1}{3} \Delta^3 y_0 - \frac{1}{4} \Delta^4 y_0 + \frac{1}{5} \Delta^5 y_0 - \frac{1}{6} \Delta^6 y_0 + \dots \right] \quad \dots(2)$$

Again differentiating (1) w.r.t. x , we get

$$\begin{aligned}\frac{d^2y}{dx^2} &= \frac{d}{dp} \left(\frac{dy}{dp} \right) \frac{dp}{dx} \\ &= \frac{1}{h} \left[\frac{2}{2!} \Delta^2 y_0 + \frac{6p-6}{3!} \Delta^3 y_0 + \frac{12p^2-36p+22}{4!} \Delta^4 y_0 + \dots \right] \frac{1}{h}\end{aligned}$$

Putting $p = 0$, we obtain

$$\left(\frac{d^2y}{dx^2} \right)_{x_0} = \frac{1}{h^2} \left[\Delta^2 y_0 - \Delta^3 y_0 + \frac{11}{12} \Delta^4 y_0 - \frac{5}{6} \Delta^5 y_0 + \frac{137}{180} \Delta^6 y_0 + \dots \right] \quad \dots(3)$$

$$\text{Similarly } \left(\frac{d^3y}{dx^3} \right)_{x_0} = \frac{1}{h^3} \left[\Delta^3 y_0 - \frac{3}{2} \Delta^4 y_0 + \dots \right] \quad \dots(4)$$

Otherwise : We know that $1 + \Delta = E = e^{hD}$

$$\therefore hD = \log(1 + \Delta) = \Delta - \frac{1}{2} \Delta^2 + \frac{1}{3} \Delta^3 - \frac{1}{4} \Delta^4 + \dots$$

$$\text{or } D = \frac{1}{h} \left[\Delta - \frac{1}{2} \Delta^2 + \frac{1}{3} \Delta^3 - \frac{1}{4} \Delta^4 + \dots \right]$$

$$\text{and } D^2 = \frac{1}{h^2} \left[\Delta - \frac{1}{2} \Delta^2 + \frac{1}{3} \Delta^3 - \frac{1}{4} \Delta^4 + \dots \right]^2 = \frac{1}{h^2} \left[\Delta^2 - \Delta^3 + \frac{11}{12} \Delta^4 + \dots \right]$$

$$\text{and } D^3 = \frac{1}{h^3} \left[\Delta^3 - \frac{3}{2} \Delta^4 + \dots \right]$$

Now applying the above identities to y_0 , we get

$$Dy_0, \text{ i.e., } \left(\frac{dy}{dx} \right)_{x_0} = \frac{1}{h} \left[\Delta y_0 - \frac{1}{2} \Delta^2 y_0 + \frac{1}{3} \Delta^3 y_0 - \frac{1}{4} \Delta^4 y_0 + \frac{1}{5} \Delta^5 y_0 - \frac{1}{6} \Delta^6 y_0 + \dots \right]$$

$$\left(\frac{d^2y}{dx^2} \right)_{x_0} = \frac{1}{h^2} \left[\Delta^2 y_0 - \Delta^3 y_0 + \frac{11}{12} \Delta^4 y_0 - \frac{5}{6} \Delta^5 y_0 + \frac{137}{180} \Delta^6 y_0 - \dots \right]$$

$$\text{and } \left(\frac{d^3y}{dx^3} \right)_{x_0} = \frac{1}{h^3} \left[\Delta^3 y_0 - \frac{3}{2} \Delta^4 y_0 + \dots \right]$$

which are the same as (2), (3) and (4) respectively.

(2) Derivatives using backward difference formula. Newton's backward interpolation formula (p. 958) is

$$y = y_n + p \nabla y_n + \frac{p(p+1)}{2!} \nabla^2 y_n + \frac{p(p+1)(p+2)}{3!} \nabla^3 y_n + \dots$$

Differentiating both sides w.r.t. p , we get

$$\frac{dy}{dp} = \nabla y_n + \frac{2p+1}{2!} \nabla^2 y_n + \frac{3p^2+6p+2}{3!} \nabla^3 y_n + \dots$$

$$\text{Since } p = \frac{x-x_n}{h}, \text{ therefore } \frac{dp}{dx} = \frac{1}{h}.$$

$$\text{Now } \frac{dy}{dx} = \frac{dy}{dp} \cdot \frac{dp}{dx} = \frac{1}{h} \left[\nabla y_n \frac{2p+1}{2!} \nabla^2 y_n + \frac{3p^2+6p+2}{3!} \nabla^3 y_n + \dots \right] \quad \dots(5)$$

At $x = x_n$, $p = 0$. Hence putting $p = 0$, we get

$$\left(\frac{dy}{dx} \right)_{x_n} = \frac{1}{h} \left[\nabla y_n + \frac{1}{2} \nabla^2 y_n + \frac{1}{3} \nabla^3 y_n + \frac{1}{4} \nabla^4 y_n + \frac{1}{5} \nabla^5 y_n + \frac{1}{6} \nabla^6 y_n + \dots \right] \quad \dots(6)$$

Again differentiating (5) w.r.t. x , we have

$$\frac{d^2y}{dx^2} = \frac{d}{dp} \left(\frac{dy}{dx} \right) \frac{dp}{dx} = \frac{1}{h^2} \left[\nabla^2 y_n + \frac{6p+6}{3!} \nabla^3 y_n + \frac{6p^2+18p+11}{12} \nabla^4 y_n + \dots \right]$$

Putting $p = 0$, we obtain

$$\left(\frac{d^2y}{dx^2} \right)_{x_0} = \frac{1}{h^2} \left[\nabla^2 y_n + \nabla^3 y_n + \frac{11}{12} \nabla^4 y_n + \frac{5}{6} \nabla^5 y_n + \frac{137}{180} \nabla^6 y_n + \dots \right] \quad \dots(7)$$

Similarly, $\left(\frac{d^3y}{dx^3} \right)_{x_0} = \frac{1}{h^3} \left[\nabla^3 y_n + \frac{3}{2} \nabla^4 y_n + \dots \right] \quad \dots(8)$

Otherwise : We know that $1 - \nabla = E^{-1} = e^{-hD}$

$$\therefore -hD = \log(1 - \nabla) = - \left[\nabla + \frac{1}{2} \nabla^2 + \frac{1}{3} \nabla^3 + \frac{1}{4} \nabla^4 + \dots \right]$$

or

$$D = \frac{1}{h} \left[\nabla + \frac{1}{2} \nabla^2 + \frac{1}{3} \nabla^3 + \frac{1}{4} \nabla^4 + \dots \right]$$

$$\therefore D^2 = \frac{1}{h^2} \left[\nabla + \frac{1}{2} \nabla^2 + \frac{1}{3} \nabla^3 + \dots \right]^2 = \frac{1}{h^2} \left[\nabla^2 + \nabla^3 + \frac{11}{12} \nabla^4 + \dots \right]$$

Similarly, $D^3 = \frac{1}{h^3} \left[\nabla^3 + \frac{3}{2} \nabla^4 + \dots \right]$

Applying these identities to y_n , we get

$$Dy_n, \text{ i.e., } \left(\frac{dy}{dx} \right)_{x_0} = \frac{1}{h} \left[\nabla y_n + \frac{1}{2} \nabla^2 y_n + \frac{1}{3} \nabla^3 y_n + \frac{1}{4} \nabla^4 y_n + \frac{1}{5} \nabla^5 y_n + \frac{1}{6} \nabla^6 y_n + \dots \right]$$

$$\left(\frac{d^2y}{dx^2} \right)_{x_0} = \frac{1}{h^2} \left(\nabla^2 y_n + \nabla^3 y_n + \frac{11}{12} \nabla^4 y_n + \frac{5}{6} \nabla^5 y_n + \frac{137}{180} \nabla^6 y_n + \dots \right)$$

and

$$\left(\frac{d^3y}{dx^3} \right)_{x_0} = \frac{1}{h^3} \left[\nabla^3 y_n + \frac{3}{2} \nabla^4 y_n + \dots \right]$$

which are the same as (6), (7) and (8).

(3) Derivatives using central difference formulae. Stirling's formula (p. 964) is

$$y_p = y_0 + \frac{p}{1!} \left(\frac{\Delta y_0 + \Delta y_{-1}}{2} \right) + \frac{p^2}{2!} \Delta^2 y_{-1} + \frac{p(p^2 - 1^2)}{3!} \left(\frac{\Delta^3 y_{-1} + \Delta^3 y_{-2}}{2} \right) + \frac{p^2(p^2 - 1^2)}{4!} \Delta^4 y_{-2} + \dots$$

Differentiating both sides w.r.t. p , we get

$$\frac{dy}{dp} = \left(\frac{\Delta y_0 + \Delta y_{-1}}{2} \right) + \frac{2p}{2!} \Delta^2 y_{-1} + \frac{3p^2 - 1}{3!} \left(\frac{\Delta^3 y_{-1} + \Delta^3 y_{-2}}{2} \right) + \frac{4p^3 - 2p}{4!} \Delta^4 y_{-2} + \dots$$

$$\text{Since } p = \frac{x - x_0}{h}, \quad \therefore \frac{dp}{dx} = \frac{1}{h}.$$

$$\text{Now } \frac{dy}{dx} = \frac{dy}{dp} \cdot \frac{dp}{dx} = \frac{1}{h} \left[\left(\frac{\Delta y_0 + \Delta y_{-1}}{2} \right) + p \Delta^2 y_{-1} + \frac{3p^2 - 1}{6} \left(\frac{\Delta^3 y_{-1} + \Delta^3 y_{-2}}{2} \right) + \frac{2p^3 - p}{12} \Delta^4 y_{-2} + \dots \right]$$

At $x = x_0, p = 0$. Hence putting $p = 0$, we get

$$\left(\frac{dy}{dx} \right)_{x_0} = \frac{1}{h} \left[\frac{\Delta y_0 + \Delta y_{-1}}{2} - \frac{1}{6} \frac{\Delta^3 y_{-1} + \Delta^3 y_{-2}}{2} + \frac{1}{30} \frac{\Delta^5 y_{-2} + \Delta^5 y_{-3}}{2} + \dots \right] \quad \dots(9)$$

$$\text{Similarly } \left(\frac{d^2y}{dx^2} \right)_{x_0} = \frac{1}{h^2} \left[\Delta^2 y_{-1} - \frac{1}{12} \Delta^4 y_{-2} + \frac{1}{90} \Delta^6 y_{-3} - \dots \right] \quad \dots(10)$$

Obs. We can similarly use any other interpolation formula for computing the derivatives.

Example 30.1. Given that

$x:$	1.0	1.1	1.2	1.3	1.4	1.5	1.6
$y:$	7.989	8.403	8.781	9.129	9.451	9.750	10.031

find $\frac{dy}{dx}$ and $\frac{d^2y}{dx^2}$ at (a) $x = 1.1$
 (b) $x = 1.6$.

(V.T.V., 2006; Madras, 2003 S)

(Rohtak, 2006; J.N.T.U., 2004 S)

Solution. (a) The difference table is :

x	y	Δ	Δ^2	Δ^3	Δ^4	Δ^5	Δ^6
1.0	7.989	0.414					
1.1	8.403	0.378	-0.036	0.006			
1.2	8.781	0.348	-0.030	0.004	-0.002	0.001	
1.3	9.129	0.322	-0.026	0.003	-0.001	0.003	0.002
1.4	9.451	0.299	-0.023	0.005	0.002		
1.5	9.750		-0.018				
1.6	10.031	0.281					

We have

$$\left(\frac{dy}{dx}\right)_{x_0} = \frac{1}{h} \left[\Delta y_0 - \frac{1}{2} \Delta^2 y_0 + \frac{1}{3} \Delta^3 y_0 - \frac{1}{4} \Delta^4 y_0 + \frac{1}{5} \Delta^5 y_0 - \frac{1}{6} \Delta^6 y_0 + \dots \right] \quad \dots(i)$$

$$\text{and } \left(\frac{d^2y}{dx^2}\right)_{x_0} = \frac{1}{h^2} \left[\Delta^2 y_0 - \Delta^3 y_0 + \frac{11}{12} \Delta^4 y_0 - \frac{5}{6} \Delta^5 y_0 - \dots \right] \quad \dots(ii)$$

Here $h = 0.1$, $x_0 = 1.1$, $\Delta y_0 = 0.378$, $\Delta^2 y_0 = -0.03$ etc.

Substituting these values in (i) and (ii), we get

$$\left(\frac{dy}{dx}\right)_{1.1} = \frac{1}{0.1} \left[0.378 - \frac{1}{2} (-0.03) + \frac{1}{3} (0.004) - \frac{1}{4} (-0.001) + \frac{1}{5} (0.003) \right] = 3.952$$

$$\left(\frac{d^2y}{dx^2}\right)_{1.1} = \frac{1}{(0.1)^2} \left[-0.03 - (0.004) + \frac{11}{12} (-0.001) - \frac{5}{6} (0.003) \right] = -3.74$$

(b) We use the above difference table and the backward difference operator ∇ instead of Δ .

$$\left(\frac{dy}{dx}\right)_{x_0} = \frac{1}{h} \left[\nabla y_n + \frac{1}{2} \nabla^2 y_n + \frac{1}{3} \nabla^3 y_n + \frac{1}{4} \nabla^4 y_n + \frac{1}{5} \nabla^5 y_n + \frac{1}{6} \nabla^6 y_n + \dots \right] \quad \dots(i)$$

$$\text{and } \left(\frac{d^2y}{dx^2}\right)_{x_0} = \frac{1}{h^2} \left[\nabla^2 y_n + \nabla^3 y_n + \frac{11}{12} \nabla^4 y_n + \frac{5}{6} \nabla^5 y_n + \frac{137}{180} \nabla^6 y_n + \dots \right] \quad \dots(ii)$$

Here $h = 0.1$, $x_n = 1.6$, $\nabla y_n = 0.281$, $\nabla^2 y_n = -0.018$ etc.

Putting these values in (i) and (ii), we get

$$\left(\frac{dy}{dx}\right)_{1.6} = \frac{1}{0.1} \left[0.281 + \frac{1}{2} (-0.018) + \frac{1}{3} (0.005) + \frac{1}{4} (0.002) + \frac{1}{5} (0.003) + \frac{1}{6} (0.002) \right] = 2.75$$

$$\begin{aligned} \left(\frac{d^2y}{dx^2}\right)_{1.6} &= \frac{1}{(0.1)^2} \left[-0.018 + 0.005 + \frac{11}{12} (0.002) + \frac{5}{6} (0.003) + \frac{137}{180} (0.002) \right] \\ &= -0.715. \end{aligned}$$

Example 30.2. The following data gives the velocity of a particle for 20 seconds at an interval of 5 seconds. Find the initial acceleration using the entire data :

Time t (sec)	:	0	5	10	15	20
Velocity v (m/sec)	:	0	3	14	69	228

(Anna, 2004)

Solution. The difference table is :

t	v	Δv	$\Delta^2 v$	$\Delta^3 v$	$\Delta^4 v$
0	0		3		
5	3		11	8	
10	14		55	44	36
15	69		159	104	60
20	228				24

An initial acceleration (i.e. $\frac{dv}{dt}$) at $t = 0$ is required, we use Newton's forward formula :

$$\left(\frac{dv}{dt} \right)_{t=0} = \frac{1}{h} \left(\Delta v_0 - \frac{1}{2} \Delta^2 v_0 + \frac{1}{3} \Delta^3 v_0 - \frac{1}{4} \Delta^4 v_0 + \dots \right)$$

$$\therefore \left(\frac{dv}{dt} \right)_{t=0} = \frac{1}{5} \left[3 - \frac{1}{2}(8) + \frac{1}{3}(36) - \frac{1}{4}(24) \right] = \frac{1}{5} (3 - 4 + 12 - 6) = 1$$

Hence the initial acceleration is 1 m/sec^2 .

Example 30.3. A slider in a machine moves along a fixed straight rod. Its distance x cm. along the rod is given below for various values of the time t seconds. Find the velocity of the slider and its acceleration when $t = 0.3$ seconds.

$t =$	0	0.1	0.2	0.3	0.4	0.5	0.6	(V.T.U, 2009)
$x =$	30.13	31.62	32.87	33.64	33.95	33.81	33.24	

Solution. The difference table is :

t	x	Δ	Δ^2	Δ^3	Δ^4	Δ^5	Δ^6
0	30.13		1.49				
0.1	31.62		1.25	-0.24	-0.24		
0.2	32.87		0.77	-0.48	0.02	0.26	
0.3	33.64		0.31	-0.46	0.01	-0.01	-0.27
0.4	33.95		-0.14	-0.45	0.02	0.01	0.02
0.5	33.81		-0.57	-0.43			
0.6	33.24						

As the derivatives are required near the middle of the table, we use Stirling's formulae :

$$\left(\frac{dx}{dt} \right)_{t_0} = \frac{1}{h} \left(\frac{\Delta x_0 + \Delta x_{-1}}{2} \right) - \frac{1}{6} \left(\frac{\Delta^3 x_{-1} + \Delta^3 x_{-2}}{2} \right) + \frac{1}{30} \left(\frac{\Delta^5 x_{-2} + \Delta^5 x_{-3}}{2} \right) + \dots \quad \dots(i)$$

$$\left(\frac{d^2x}{dt^2} \right)_{t_0} = \frac{1}{h^2} \left[\Delta^2 x_{-1} - \frac{1}{12} \Delta^4 x_{-2} + \frac{1}{90} \Delta^6 x_{-3} \dots \right] \quad \dots(ii)$$

Here $h = 0.1$, $t_0 = 0.3$, $\Delta x_0 = 0.31$, $\Delta x_{-1} = 0.77$, $\Delta^2 x_{-1} = -0.46$ etc.

Putting these values in (i) and (ii), we get

$$\left(\frac{dx}{dt} \right)_{0.3} = \frac{1}{0.1} \left[\frac{0.31 + 0.77}{2} - \frac{1}{6} \left(\frac{0.01 + 0.02}{2} \right) + \frac{1}{30} \left(\frac{0.02 - 0.27}{2} \right) - \dots \right] = 5.33$$

$$\left(\frac{d^2x}{dt^2} \right)_{0.3} = \frac{1}{(0.1)^2} \left[-0.46 - \frac{1}{12} (-0.01) + \frac{1}{90} (0.29) - \dots \right] = -45.6$$

Hence the required velocity is 5.33 cm/sec and acceleration is -45.6 cm/sec².

Example 30A. Using Bessel's formula, find $f'(7.5)$ from the following table :

x :	7.47	7.48	7.49	7.50	7.51	7.52	7.53	
$f(x)$:	0.193	0.195	0.198	0.201	0.203	0.206	0.208	(J.N.T.U., 2006)

Solution. Taking $x_0 = 7.50$, $h = 0.1$, we have $p = \frac{x - x_0}{h} = \frac{x - 7.50}{0.01}$

The difference table is :

x	p	y_p	Δ	Δ^2	Δ^3	Δ^4	Δ^5	Δ^6
7.47	-3	0.193		0.002				
7.48	-2	0.195	0.003	0.001		-0.001		
7.49	-1	0.198	0.003	0.000	-0.001	0.000	0.003	
7.50	0	0.201	0.002	-0.001	0.002	0.003	-0.007	-0.01
7.51	1	0.203	0.003	0.001	-0.002	-0.004		
7.52	2	0.206	0.003	-0.001				
7.53	3	0.208	0.002					

Bessel's formula (p. 550) is

$$y_p = y_0 + p\Delta y_0 + \frac{p(p-1)}{2!} \cdot \frac{\Delta^2 y_{-1} + \Delta^2 y_0}{2} + \frac{\left(p - \frac{1}{2} \right) p(p-1)}{3!} \cdot \Delta^3 y_{-1} \\ + \frac{(p+1)p(p-1)(p-2)}{4!} \cdot \frac{\Delta^4 y_{-2} + \Delta^4 y_{-1}}{2} + \frac{\left(p - \frac{1}{2} \right) (p+1)p(p-1)(p-2)}{5!} \cdot \Delta^5 y_{-2} \\ + \frac{(p+2)p(p+1)p(p-1)(p-2)(p-3)}{6!} \cdot \frac{\Delta^6 y_{-3} + \Delta^6 y_{-2}}{2} + \dots \quad \dots(i)$$

Since $p = \frac{x - x_0}{h}$, $\therefore \frac{dp}{dx} = \frac{1}{h}$ and $\frac{dy}{dx} = \frac{dy}{dp} \cdot \frac{dp}{dx} = \frac{1}{h} \frac{dy}{dp}$

Differentiating (i) w.r.t. p and putting $p = 0$, we get

$$\left(\frac{dy}{dx} \right)_{7.5} = \frac{1}{h} \left(\frac{dy}{dp} \right)_{p=0} = \frac{1}{h} \left[\Delta y_0 - \frac{1}{h} (\Delta^2 y_{-1} + \Delta^2 y_0) + \frac{1}{12} \Delta^3 y_{-1} + \frac{1}{24} (\Delta^4 y_{-2} + \Delta^4 y_{-1}) \right. \\ \left. - \frac{1}{120} \Delta^5 y_{-2} - \frac{1}{240} (\Delta^6 y_{-3} + \Delta^6 y_{-2}) \right]$$

$$\begin{aligned} \left(\frac{dy}{dx}\right)_{7.5} &= \frac{1}{0.01} \left[0.002 - \frac{1}{4} (-0.001 + 0.001) + \frac{1}{12} (0.002)^1 \right. \\ &\quad \left. + \frac{1}{24} (-0.004 + 0.003) - \frac{1}{120} (-0.007) \frac{-1}{240} (0.010 + 0) \right] \\ &= 0.2 + 0 + 0.01666 - 0.00583 + 0.00416 = 0.223. \end{aligned}$$

Example 30.5. Find $f'(0)$ from the following data :

x :	3	5	11	27	34
$f(x)$:	-13	23	899	17315	35606

Solution. As the values of x are not equi-spaced, we shall use Newton's divided difference formula. The divided difference table is

x	$f(x)$	1st div. diff.	2nd div. diff.	3rd div. diff.	4th div. diff.
3	-13				
5	23	18			
11	899	146	16		0.998
27	17315	1025	39.96		1.003
34	35606	2613	69.04		0.0002

Fifth difference being zero, Newton's divided difference formula is

$$\begin{aligned} f(x) &= f(x_0) + (x - x_0) f(x_0 - x_1) + (x - x_0)(x - x_1) f(x_0, x_1, x_2) \\ &\quad + (x - x_0)(x - x_1)(x - x_2) f(x_0, x_1, x_2, x_3) + (x - x_0)(x - x_1) \\ &\quad \times (x - x_2)(x - x_3) f(x_0, x_1, x_2, x_3, x_4) \end{aligned}$$

Differentiating it w.r.t. x , we get

$$\begin{aligned} f'(x) &= f(x_0, x_1) + (2x - x_0 - x_1) f(x_0, x_1, x_2) \\ &\quad + [3x^2 - 2x(x_0 + x_1 + x_2) + (x_0 x_1 + x_1 x_2 + x_2 x_0)] \times f(x_0, x_1, x_2, x_3) \\ &\quad + [4x^3 - 3x^2(x_0 + x_1 + x_2 + x_3) + 2x(x_0 x_1 + x_1 x_2 + x_2 x_3 + x_3 x_0 + x_1 x_3 + x_0 x_2) \\ &\quad - x_0 x_1 x_2 + x_1 x_2 x_3 + x_2 x_3 x_0 + x_0 x_1 x_3] f(x_0, x_1, x_2, x_3, x_4) \end{aligned}$$

Putting $x_0 = 3, x_1 = 5, x_2 = 11, x_3 = 27$ and $x = 10$, we obtain

$$f'(x) = 18 + 12 \times 16 + 23 \times 0.998 - 426 \times 0.0002 = 232.869.$$

30.3 MAXIMA AND MINIMA OF A TABULATED FUNCTION

Newton's forward interpolation formula is

$$y = y_0 + p \frac{(p-1)}{2!} \Delta^2 y_0 + \frac{p(p-1)(p-2)}{3!} \Delta^3 y_0 + \dots$$

Differentiating it w.r.t. p , we get

$$\frac{dy}{dp} = \Delta y_0 + \frac{2p-1}{2} \Delta^2 y_0 + \frac{3p^2-6p+2}{6} \Delta^3 y_0 + \dots \quad \dots(1)$$

For maxima or minima, $dy/dp = 0$. Hence equating the right hand side of (1) to zero and retaining only upto third differences, we obtain

$$\Delta y_0 + \frac{2p-1}{2} \Delta^2 y_0 + \frac{3p^2-6p+2}{6} \Delta^3 y_0 = 0$$

$$\left(\frac{1}{2} \Delta^3 y_0 \right) p^2 + (\Delta^2 y_0 - \Delta^3 y_0) p + \left(\Delta y_0 - \frac{1}{2} \Delta^2 y_0 + \frac{1}{3} \Delta^3 y_0 \right) = 0$$

i.e.,

Substituting the values of Δy_0 , $\Delta^2 y_0$, $\Delta^3 y_0$ from the difference table, we solve this quadratic for p . Then the corresponding values of $x = x_0 + ph$ at which y is maximum or minimum.

Example 30.6. Find the maximum and minimum value of y from the following data :

$x :$	-2	-1	0	1	2	3	4
$y :$	2	-0.25	0	-0.25	2	15.75	56

(Anna, 2004)

Solution. The difference table is :

x	y	Δy	$\Delta^2 y$	$\Delta^3 y$	$\Delta^4 y$	$\Delta^5 y$
-2	2		-2.25			
-1	-0.25	0.25	2.5	-3		
0	0	-0.25	-0.5	3	6	0
1	-0.25	0.25	2.5	9	6	0
2	2	13.75	11.5	15		
3	15.75	40.25	26.5			
4	56					

Taking $x_0 = 0$, we have $y_0 = 0$, $\Delta y_0 = -0.25$, $\Delta^2 y_0 = 2.5$, $\Delta^3 y_0 = 9$, $\Delta^4 y_0 = 6$.

Newton's forward difference formula for the first derivative gives

$$\begin{aligned} \frac{dy}{dx} &= \frac{1}{h} \left[\Delta y_0 - \frac{2p-1}{2!} \Delta^2 y_0 + \frac{3p^2 - 6p + 2}{3!} \Delta^3 y_0 - \frac{4p^3 - 18p^2 + 22p - 6}{4!} \Delta^4 y_0 - \dots \right] \\ &= \frac{1}{1} \left[-0.25 + \frac{2x-1}{2} (2.5) + \frac{1}{6} (3x^2 - 6x + 2)(9) + \frac{1}{24} (4x^2 - 18x^2 + 22x - 6)(6) \right] \\ &= \frac{1}{1} [-0.25 + 2.5x - 1.25 + 4.5x^2 - 9x + 3 + x^3 - 4.5x^2 + 5.5x - 1.5] = x^3 - x \end{aligned}$$

For y to be maximum or minimum, $\frac{dy}{dx} = 0$ i.e., $x^3 - x = 0$

i.e.,

$$x = 0, 1, -1$$

Now $\frac{d^2y}{dx^2} = 3x^2 - 1 = -ve$ for $x = 0$
 $= +ve$ for $x = 1$
 $= +ve$ for $x = -1$

Since $y = y_0 + x\Delta y_0 + \frac{x(x-1)}{2!} \Delta^2 y_0 + \dots$, $y(0) = 0$

Thus y is maximum for $x = 0$, and maximum value = $y(0) = 0$.

Also y is minimum for $x = 1$ and minimum value = $y(1) = -0.25$.

PROBLEMS 30.1

1. Find $y'(0)$ and $y''(0)$ from the following table :

$x :$	0	1	2	3	4	5
$y :$	4	8	15	7	6	2

2. Find the first and second derivatives of $f(x)$ at $x = 1.5$ if

$x :$	1.5	2.0	2.5	3.0	3.5	4.0
$f(x) :$	3.375	7.000	13.625	24.000	38.875	59.000

(S.V.T.U., 2007)

3. Find the first and second derivatives of the function tabulated below, at the point $x = 1.1$:

$x :$	1.0	1.2	1.4	1.6	1.8	2.0
$y :$	0	0.128	0.544	1.296	2.432	4.000

(U.P.T.U., 2010; Bhopal, 2009)

4. Given the following table of values of x and y :

$x :$	1.00	1.05	1.10	1.15	1.20	1.25	1.30
$y :$	1.000	1.025	1.049	1.072	1.095	1.118	1.140

find $\frac{dy}{dx}$ and $\frac{d^2y}{dx^2}$ at (a) $x = 1.05$ (b) $x = 1.25$ (c) $x = 1.15$.

(V.T.U., 2008)

5. For the following values of x and y , find the first derivative at $x = 4$:

$x :$	1	2	4	8	10
$y :$	0	1	5	21	27

(J.N.T.U., 2009)

6. From the following table, find the values of dy/dx and d^2y/dx^2 at $x = 2.03$:

$x :$	1.96	1.98	2.00	2.02	2.04
$y :$	0.7825	0.7739	0.7651	0.7563	0.7473

(Anna, 2005)

7. Find the value of $\cos 1.74$ from the following table:

$x :$	1.7	1.74	1.78	1.82	1.86
$\sin x :$	0.9816	0.9857	0.9781	0.9691	0.9584

(J.N.T.U., 2009)

8. The distance covered by an athlete for the 50 metre is given in the following table:

<i>Time (sec)</i> :	0	1	2	3	4	5	6
<i>Distance (metre)</i> :	0	2.5	8.5	15.5	24.5	36.5	50

(U.P.T.U., 2009)

9. The following data gives corresponding values of pressure and specific volume of a superheated stream:

$v :$	2	4	6	8	10
$p :$	105	42.7	25.3	16.7	13

Find the rate of change of

- (i) pressure with respect to volume when $v = 2$,
(ii) volume with respect to pressure when $p = 105$.

10. The table below reveals the velocity v of a body during the specific time t , find its acceleration at $t = 1.1$?

$t :$	1.0	1.1	1.2	1.3	1.4
$v :$	43.1	47.7	52.1	56.4	60.8

(J.N.T.U., 2009)

11. The elevation above a datum line of 7 points of a road is given below:

$x :$	0	300	600	900	1200	1500	1800
$y :$	135	149	157	183	201	205	193

Find the gradient of the road at the middle point.

12. A rod is rotating in a plane. The following table gives the angle θ (radians) through which the rod has turned for various values of the time t second.

$t :$	0	0.2	0.4	0.6	0.8	1.0	1.2
$\theta :$	0	0.12	0.49	1.12	2.02	3.20	4.67

Calculate the angular velocity and the angular acceleration of the rod, when $t = 0.6$ second.

(V.T.U., 2004)

13. Find the value of $f'(x)$ at $x = 0.4$ from the following table using Bessel's formula

$x :$	0.01	0.02	0.03	0.04	0.05	0.06
$f(x) :$	0.1023	0.1047	0.1071	0.1096	0.1122	0.1148

14. If $y = f(x)$ and y_n denotes $f(x_0 + nh)$, prove that, if powers of h above h^6 be neglected,

$$\left(\frac{dy}{dx} \right)_{x_0} = \frac{3}{4h} \left[(y_1 - y_{-1}) - \frac{1}{5} (y_2 - y_{-2}) + \frac{1}{45} (y_3 - y_{-3}) \right]$$

(U.P.T.U., 2006)

[Hint: Differentiate Stirling's formula w.r.t. x , and put $x = 0$]

15. Find the value of $f''(8)$ from the table given below:

$x :$	6	7	9	12
$f(x) :$	1.556	1.690	1.908	2.158

(Anna, 2007)

16. Find the $f''(6)$ from the following data:

$x :$	0	2	3	4	7	8
$f(x) :$	4	26	58	112	466	922

(J.N.T.U., 2009; U.P.T.U., 2008)

17. Find the maximum and minimum values of y from the following table :

x :	0	1	2	3	4	5
$f(x)$:	0	0.25	0	2.25	16	56.25

18. Find the value of x for which $f(x)$ is minimum, using the table

x :	9	10	11	12	13	14
$f(x)$:	1330	1340	1320	1250	1120	930

Also find the maximum value of $f(x)$?

30.4 NUMERICAL INTEGRATION

The process of evaluating a definite integral from a set of tabulated values of the integrand $f(x)$ is called *numerical integration*. This process when applied to a function of a single variable, is known as *quadrature*.

The problem of numerical integration, like that of numerical differentiation, is solved by representing $f(x)$ by an interpolation formula and then integrating it between the given limits. In this way, we can derive quadrature formula for approximate integration of a function defined by a set of numerical values only.

30.5 NEWTON-COTES QUADRATURE FORMULA

$$\text{Let } I = \int_a^b f(x) dx$$

where $f(x)$ takes the values $y_0, y_1, y_2, \dots, y_n$ for $x = x_0, x_1, x_2, \dots, x_n$. (Fig. 30.1)

Let us divide the interval (a, b) into n sub-intervals of width h so that $x_0 = a, x_1 = x_0 + h, x_2 = x_0 + 2h, \dots, x_n = x_0 + nh = b$. Then

$$I = \int_{x_0}^{x_0 + nh} f(x) dx = h \int_0^n f(x_0 + rh) dr,$$

putting $x = x_0 + rh, dx = hdr$

$$\begin{aligned} &= h \int_0^n \left[y_0 + r \Delta y_0 + \frac{r(r-1)}{2!} \Delta^2 y_0 + \frac{r(r-1)(r-2)}{3!} \Delta^3 y_0 \right. \\ &\quad + \frac{r(r-1)(r-2)(r-3)}{4!} \Delta^4 y_0 + \frac{r(r-1)(r-2)(r-3)(r-4)}{5!} \Delta^5 y_0 \\ &\quad \left. + \frac{r(r-1)(r-2)(r-3)(r-4)(r-5)}{6!} \Delta^6 y_0 + \dots \right] dr \end{aligned}$$

[By Newton's forward interpolation formula]

Integrating term by term, we obtain

$$\begin{aligned} \int_{x_0}^{x_0 + nh} f(x) dx &= nh \left[y_0 + \frac{n}{2} \Delta y_0 + \frac{n(2n-3)}{12} \Delta^2 y_0 + \frac{n(n-2)^2}{24} \Delta^3 y_0 \right] \\ &\quad + \left(\frac{n^4}{5} - \frac{3n^3}{2} + \frac{11n^2}{3} - 3n \right) \frac{\Delta^4 y_0}{4!} + \left(\frac{n^5}{6} - 2n^4 + \frac{35n^3}{4} - \frac{50n^2}{3} + 12n \right) \frac{\Delta^5 y_0}{5!} \\ &\quad + \left(\frac{n^6}{7} - \frac{15n^5}{6} + 17n^4 - \frac{225n^3}{4} + \frac{274n^2}{3} - 60n \right) \frac{\Delta^6 y_0}{6!} + \dots \end{aligned} \quad \dots(A)$$

This is known as *Newton-Cotes quadrature formula*. From this general formula, we deduce the following important quadrature rules by taking $n = 1, 2, 3 \dots$

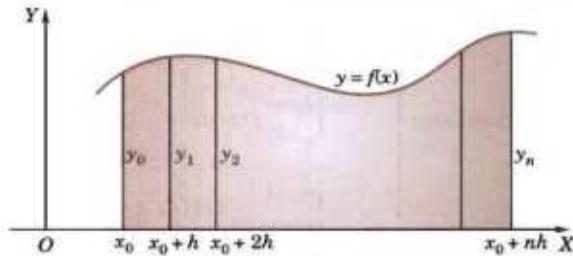

Fig. 30.1

30.6 TRAPEZOIDAL RULE

Putting $n = 1$ in (A) § 30.5 and taking the curve through (x_0, y_0) and (x_1, y_1) as a straight line i.e. a polynomial of first order so that differences of order higher than first become zero, we get

$$\int_{x_0}^{x_0 + h} f(x) dx = h \left(y_0 + \frac{1}{2} \Delta y_0 \right) = \frac{h}{2} (y_0 + y_1)$$

Similarly $\int_{x_0}^{x_0 + 2h} f(x) dx = h \left(y_1 + \frac{1}{2} \Delta y_1 \right) = \frac{h}{2} (y_1 + y_2)$

$$\int_{x_0 + (n-1)h}^{x_0 + nh} f(x) dx = \frac{h}{2} (y_{(n-1)} + y_n)$$

Adding these n integrals, we obtain

$$\int_{x_0}^{x_0 + nh} f(x) dx = \frac{h}{2} [(y_0 + y_n) + 2(y_1 + y_2 + \dots + y_{n-1})]$$

This is known as the **trapezium rule**.

Obs. The area of each strip (trapezium) is found separately. Then the area under the curve and the ordinates at x_0 and $x_0 + nh$ is approximately equal to the areas of the trapezia.

30.7 SIMPSON'S ONE-THIRD RULE

Putting $n = 2$ in (A) above and taking the curve through $(x_0, y_0), (x_1, y_1)$ and (x_2, y_2) as a parabola i.e., a polynomial of second order so that differences of order higher than second vanish, we get

$$\int_{x_0}^{x_0 + 2h} f(x) dx = 2h (y_0 + \Delta y_0 + \frac{1}{6} \Delta^2 y_0) \frac{h}{3} (y_0 + 4y_1 + y_2)$$

Similarly, $\int_{x_0 + 2h}^{x_0 + nh} f(x) dx = \frac{h}{3} (y_2 + 4y_3 + y_4)$ when

$$\int_{x_0 + (n-2)h}^{x_0 + nh} f(x) dx = \frac{h}{3} (y_{n-2} + 4y_{n-1} + y_n), n \text{ being even.}$$

Adding all these integrals, we have (when n is even)

$$\int_{x_0}^{x_0 + nh} f(x) dx = \frac{h}{3} [(y_0 + y_n) + 4(y_1 + y_3) + \dots + y_{n-1}] + 2(y_2 + y_4 + \dots + y_{n-2})$$

This is known as the **Simpson's one-third rule** or simply **Simpson's rule** and is most commonly used.

Obs. While applying Simpson's 1/3rd rule, the given interval must be divided into even number of equal subintervals, since we find the area of two strips at a time.

30.8 SIMPSON'S THREE-EIGHTH RULE

Putting $n = 3$ in (A) above and taking the curve through $(x_i, y_i); i = 0, 1, 2, 3$ as a polynomial of third order so that differences above the third order vanish, we get

$$\begin{aligned} \int_{x_0}^{x_0 + 3h} f(x) dx &= 3h \left(y_0 + \frac{3}{2} \Delta y_0 + \frac{3}{4} \Delta^2 y_0 + \frac{1}{8} \Delta^3 y_0 \right) \\ &= \frac{3h}{8} (y_0 + 3y_1 + 3y_2 + y_3) \end{aligned}$$

Similarly,

$$\int_{x_0 + 3h}^{x_0 + nh} f(x) dx = \frac{3h}{8} (y_3 + 3y_4 + 3y_5 + y_6) \text{ and so on.}$$

Adding all such expressions from x_0 to $x_0 + nh$, where n is a multiple of 3, we obtain

$$\int_{x_0}^{x_0 + nh} f(x) dx = \frac{3h}{8} [(y_0 + y_n) + 3(y_1 + y_2 + y_4 + y_5 + \dots + y_{n-1}) + 2(y_3 + y_6 + \dots + y_{n-3})]$$

which is known as **Simpson's three-eighth rule**.

Obs. While applying Simpson's 3/8th rule, the number of sub-intervals should be taken as multiple of 3.

30.9 BOOLE'S RULE

Putting $n = 4$ in (A) above and neglecting all differences above the fourth, we obtain

$$\begin{aligned}\int_{x_0}^{x_0 + 4h} f(x) dx &= 4h \left(y_0 + 2\Delta y_0 + \frac{5}{3} \Delta^2 y_0 + \frac{2}{3} \Delta^3 y_0 + \frac{7}{90} \Delta^4 y_0 \right) \\ &= \frac{2h}{45} (7y_0 + 32y_1 + 12y_2 + 32y_3 + 7y_4)\end{aligned}$$

Similarly

$$\int_{x_0 + 4h}^{x_0 + 8h} f(x) dx = \frac{2h}{45} (7y_4 + 32y_5 + 12y_6 + 32y_7 + 7y_8) \text{ and so on.}$$

Adding all these integrals from x_0 to $x_0 + nh$, where n is a multiple of 4, we get

$$\int_{x_0}^{x_0 + nh} f(x) dx = \frac{2h}{45} (7y_0 + 32y_1 + 12y_2 + 32y_3 + 14y_4 + 32y_5 + 12y_6 + 32y_7 + 14y_8 + \dots)$$

This is known as *Boole's rule*.

Obs. While applying *Boole's rule*, the number of sub-intervals should be taken as a multiple of 4.

30.10 WEDDLE'S RULE

Putting $n = 6$ in (A) above and neglecting all differences above the sixth, we obtain

$$\int_{x_0}^{x_0 + 6h} f(x) dx = \left(y_0 + 3\Delta y_0 + \frac{9}{2} \Delta^2 y_0 + 4\Delta^3 y_0 + \frac{123}{60} \Delta^4 y_0 + \frac{11}{20} \Delta^5 x_0 + \frac{1}{6} \cdot \frac{41}{140} \Delta^6 y_0 \right)$$

If we replace $\frac{41}{140} \Delta^6 y_0$ by $\frac{3}{10} \Delta^6 y_0$, the error made will be negligible.

$$\therefore \int_{x_0}^{x_0 + 6h} f(x) dx = \frac{3h}{10} (y_0 + 5y_1 + y_2 + 6y_3 + y_4 + 5y_5 + y_6)$$

Similarly

$$\int_{x_0 + 6h}^{x_0 + 12h} f(x) dx = \frac{3h}{10} (y_6 + 5y_7 + y_8 + 6y_9 + y_{10} + 5y_{11} + y_{12}) \text{ and so on.}$$

Adding all these integrals from x_0 to $x_0 + nh$, where n is a multiple of 6, we get

$$\int_{x_0}^{x_0 + nh} f(x) dx = \frac{3h}{10} (y_0 + 5y_1 + y_2 + 6y_3 + y_4 + 5y_5 + 2y_6 + 5y_7 + y_8 + \dots)$$

This is known as *Weddle's rule*.

Obs. While applying *Weddle's rule* the number of sub-intervals should be taken as a multiple of 6. *Weddle's rule* is generally more accurate than any of the others. Of the two Simpson rules, the 1/3 rule is better.

Example 30.7. Evaluate $\int_0^6 \frac{dx}{1+x^2}$ by using (i) Trapezoidal rule,

(ii) Simpson's 1/3 rule,

(Mumbai, 2005)

(iii) Simpson's 3/8 rule,

(J.N.T.U., 2008)

(iii) Weddle's rule and compare the results with its actual value.

(V.T.U., 2009)

Solution. Divide the interval (0, 6) into six parts each of width $h = 1$. The values of $f(x) = \frac{1}{1+x^2}$ are given below :

x	0	1	2	3	4	5	6
$f(x)$	1	0.5	0.2	0.1	0.05884	0.0385	0.027
$= y$	y_0	y_1	y_2	y_3	y_4	y_5	y_6

(i) By Trapezoidal rule,

$$\begin{aligned}\int_0^6 \frac{1}{1+x^2} dx &= \frac{h}{2} [(y_0 + y_6) + 2(y_1 + y_2 + y_3 + y_4 + y_5)] \\ &= \frac{1}{2} [(1 + 0.027) + 2(0.5 + 0.2 + 0.1 + 0.0588 + 0.0385)] = 1.4108.\end{aligned}$$

(ii) By Simpson's 1/3 rule,

$$\begin{aligned}\int_0^6 \frac{1}{1+x^2} dx &= \frac{h}{3} [(y_0 + y_6) + 4(y_1 + y_3 + y_5) + 2(y_2 + y_4)] \\ &= \frac{1}{3} [(1 + 0.027) + 4(0.5 + 0.1 + 0.0385) + 2(0.2 + 0.0588)] = 1.3662.\end{aligned}$$

(iii) By Simpson's 3/8 rule,

$$\begin{aligned}\int_0^6 \frac{1}{1+x^2} dx &= \frac{3h}{8} [(y_0 + y_6) + 3(y_1 + y_2 + y_4 + y_5) + 2y_3] \\ &= \frac{3}{8} [(1 + 0.027) + 3(0.5 + 0.2 + 0.0588 + 0.0385) + 2(0.1)] = 1.3571.\end{aligned}$$

(iv) By Weddle's rule,

$$\begin{aligned}\int_0^6 \frac{1}{1+x^2} dx &= \frac{3h}{10} [y_0 + 5y_1 + y_2 + 6y_3 + y_4 + 5y_5 + y_6] \\ &= 0.3[1 + 5(0.5) + 0.2 + 6(0.1) + 0.0588 + 5(0.0385) + 0.027] = 1.3735.\end{aligned}$$

Also, $\int_0^6 \frac{dx}{1+x^2} = \left| \tan^{-1} x \right|_0^6 = 1.4056$

Obs. This shows that the value of the integral found by Weddle's rule is the nearest to the actual value followed by its value given by Simpson's 1/3rd.

Example 30.8. Use the Trapezoidal rule to estimate the integral $\int_0^2 e^{x^2} dx$ taking 10 intervals.

(U.P.T.U., 2008)

Solution. Let $y = e^{x^2}$, $h = 0.2$ and $n = 10$.

The values of x and y are as follows :

$x:$	0	0.2	0.4	0.6	0.8	1.0	1.2	1.4	1.6	1.8	2.0
$y:$	1	1.0408	1.1735	1.4333	1.8964	2.1782	4.2206	7.0993	12.9358	25.5337	54.5981
	y_0	y_1	y_2	y_3	y_4	y_5	y_6	y_7	y_8	y_9	y_{10}

By Trapezoidal rule, we have

$$\begin{aligned}\int_0^2 e^{x^2} dx &= \frac{h}{2} [(y_0 + y_{10}) + 2(y_1 + y_2 + y_3 + y_4 + y_5 + y_6 + y_7 + y_8 + y_9)] \\ &= \frac{0.2}{2} [(1 + 54.5981) + 2(1.0408 + 1.1735 + 1.4333 + 1.8964 \\ &\quad + 2.178 + 4.2206 + 7.0993 + 12.9358 + 25.5337)]\end{aligned}$$

Hence $\int_0^2 e^{x^2} dx = 17.0621$.

Example 30.9. Use Simpson's 1/3rd rule to find $\int_0^{0.6} e^{-x^2} dx$ by taking seven ordinates.

(V.T.U., 2011; Bhopal, 2009)

Solution. Divide the interval $(0, 0.6)$ into six parts each of width $h = 0.1$. The values of $y = f(x) = e^{-x^2}$ are given below :

x	0	0.1	0.2	0.3	0.4	0.5	0.6
x^2	0	0.01	0.04	0.09	0.16	0.25	0.36
y	1	0.9900	0.9608	0.9139	0.8521	0.7788	0.6977
	y_0	y_1	y_2	y_3	y_4	y_5	y_6

By Simpson's 1/3rd rule, we have

$$\begin{aligned} \int_0^{0.6} e^{-x^2} dx &= \frac{h}{3} [(y_0 + y_6) + 4(y_1 + y_3 + y_5) + 2(y_2 + y_4)] \\ &= \frac{0.1}{3} [(1 + 0.6977) + 4(0.99 + 0.9139 + 0.7788) + 2(0.9608 + 0.8521)] \\ &= \frac{0.1}{3} [1.6977 + 10.7308 + 3.6258] = \frac{0.1}{3} (16.0543) = 0.5351. \end{aligned}$$

Example 30.10. Compute the value of $\int_{0.2}^{1.4} (\sin x - \log_e x + e^x) dx$ using Simpson's $\frac{3}{8}$ th rule.

(Mumbai, 2005)

Solution. Let $y = \sin x - \log_e x + e^x$ and $h = 0.2$, $n = 6$.

The values of y are as given below :

$x :$	0.2	0.4	0.6	0.8	1.0	1.2	1.4
$y :$	3.0295	2.7975	2.8976	3.1660	3.5597	4.0536	4.4042
	y_0	y_1	y_2	y_3	y_4	y_5	y_6

By Simpson's $\frac{3}{8}$ th rule, we have

$$\begin{aligned} \int_{0.2}^{1.4} y dx &= \frac{3h}{8} [(y_0 + y_6) + 2(y_3) + 3(y_1 + y_2 + y_4 + y_5)] \\ &= \frac{3}{8} (0.2) [7.7336 + 2(3.1660) + 3(13.3247)] = 4.053 \end{aligned}$$

Hence $\int_{0.2}^{1.4} (\sin x - \log_e x + e^x) dx = 4.053$.

Obs. Applications of Simpson's rule. If the various ordinates in §30.5 represent equispaced cross-sectional areas, then Simpson's rule gives the volume of the solid. As such, Simpson's rule is very useful to civil engineers for calculating the amount of earth that must be moved to fill a depression or make a dam. Similar if the ordinates denote velocities at equal intervals of time, the Simpson's rule gives the distance travelled. The following examples illustrate these applications.

Example 30.11. The velocity v (km/min) of a moped which starts from rest, is given at fixed intervals of time t (min) as follows :

$t :$	2	4	6	8	10	12	14	16	18	20
$v :$	10	18	25	29	32	20	11	5	2	0

Estimate approximately the distance covered in 20 minutes.

Solution. If s km be the distance covered in t (min), then $\frac{ds}{dt} = v$

$$\therefore s = \int_{t=0}^{20} v dt = \frac{h}{3} [X + 4.O + 2E], \text{ by Simpson's rule}$$

Hence $h = 2$, $v_0 = 0$, $v_1 = 10$, $v_2 = 18$, $v_3 = 25$ etc.

$$\therefore X = v_0 + v_{10} = 0 + 0 = 0$$

$$O = v_1 + v_3 + v_5 + v_7 + v_9 = 10 + 25 + 32 + 11 + 2 = 80$$

$$E = v_2 + v_4 + v_6 + v_8 = 18 + 29 + 20 + 5 = 72$$

Hence the required distance = $\left| s \right|_{t=0}^{20} = \frac{2}{3} (0 + 4 \times 80 + 2 \times 72)$
 $= 309.33 \text{ km.}$

Example 30.12. The velocity v of a particle at distance s from a point on its linear path is given by the following table :

$s \text{ (m)} :$	0	2.5	5.0	7.5	10.0	12.5	15.0	17.5	20.0
$v \text{ (m/sec)} :$	16	19	21	22	20	17	13	11	9

Estimate the time taken by the particle to traverse the distance of 20 metres, using Boole's rule.

(U.P.T.U. 2007)

Solution. If t sec be the time taken to traverse a distance s (m) then $\frac{ds}{dt} = v$

or $\frac{dt}{ds} = \frac{1}{v} = y \text{ (say)},$

$\therefore \text{ then } \left| t \right|_{s=0}^{s=20} = \int_0^{20} yds$

Here $h = 2.5 \text{ and } n = 8$

Also $y_0 = \frac{1}{16}, y_1 = \frac{1}{19}, y_2 = \frac{1}{4}, y_3 = \frac{1}{22}, y_4 = \frac{1}{20}, y_5 = \frac{1}{17}, y_6 = \frac{1}{13}, y_7 = \frac{1}{11}, y_8 = \frac{1}{9}$

\therefore by Boole's Rules, we have

$$\begin{aligned} \left| t \right|_{s=0}^{s=20} &= \int_0^{20} yds = \frac{2h}{45} [7y_0 + 32y_1 + 12y_2 + 32y_3 + 14y_4 + 32y_5 + 12y_6 + 32y_7 + 14y_8] \\ &= \frac{2(2.5)}{45} \left[7\left(\frac{1}{16}\right) + 32\left(\frac{1}{19}\right) + 12\left(\frac{1}{4}\right) + 32\left(\frac{1}{22}\right) + 14\left(\frac{1}{20}\right) + 32\left(\frac{1}{17}\right) \right. \\ &\quad \left. + 12\left(\frac{1}{13}\right) + 32\left(\frac{1}{11}\right) + 14\left(\frac{1}{9}\right) \right] \\ &= \frac{1}{9}(12.11776) = 1.35 \end{aligned}$$

Hence the required time = 1.35 sec.

Example 30.13. A solid of revolution is formed by rotating about the x -axis, the area between the x -axis and the lines $x = 0$ and $x = 1$ and a curve through the points with the following co-ordinates

$x :$	0.00	0.25	0.50	0.75	1.00
$y :$	1.0000	0.9896	0.9589	0.9089	0.8415

Estimate the volume of the solid formed using Simpson's rule.

(Raipur, 2007)

Solution. Here $h = 0.25, y_0 = 1, y_1 = 0.9896, y_2 = 0.9589$, etc.

\therefore Required volume of the solid generated

$$\begin{aligned} &= \int_0^1 \pi y^2 dx = \pi \cdot \frac{h}{3} [(y_0^2 + y_4^2) + 4(y_1^2 + y_3^2) + 2y_2^2] \\ &= 0.25 \cdot \frac{\pi}{3} [(1 + (0.8415)^2) + 4[(0.9896)^2 + (0.9089)^2] + 2(0.0589)^2] \\ &= \frac{0.25 \times 3.1416}{3} [1.7081 + 7.2216 + 1.839] = 0.2618 (10.7687) = 2.8192. \end{aligned}$$

PROBLEMS 30.2

1. Evaluate $\int_0^1 \frac{dx}{1+x}$ applying

- (i) Trapezoidal rule (J.N.T.U., 2009) (ii) Simpson's 1/3rd rule
 (iii) Simpson's 3/8th rule.

(Mumbai, 2004)

2. Evaluate $\int_0^1 \frac{dx}{1+x^2}$ using (i) Trapezoidal rule taking $h = 1/4$

- (ii) Simpson's 1/3rd rule taking $h = 1/4$.
 (iii) Simpson's 3/8th rule taking $h = 1/6$.
 (iv) Weddle's rule taking $h = 1/6$.

(J.N.T.U., 2008)

(U.P.T.U., 2010; V.T.U., 2007)

(Bhopal, 2009)

Hence compute an approximate value of π in each case.

3. Find an approximate value of $\log_e 5$ by calculating to 4 decimal places, by Simpson's 1/3 rule, $\int_0^5 \frac{dx}{4x+5}$, dividing the range into 10 equal parts. (Anna., 2005)

4. Evaluate $\int_0^6 x \sec x dx$ using eight intervals by Trapezoidal rule. (U.P.T.U., 2009)

5. Evaluate using Simpson's $\frac{1}{3}$ rd rule (i) $\int_0^6 \frac{e^x}{1+x} dx$ (U.P.T.U., 2006)

(ii) $\int_0^2 e^{-x^2} dx$ (Take $h = 0.25$). (J.N.T.U., 2007)

6. Evaluate using Simpson's 1/3rd rule $\int_0^1 \frac{dx}{x^3 + x + 1}$, choose step length 0.25. (U.P.T.U., 2009)

7. Evaluate using Simpson's 1/3rd rule, (i) $\int_0^{\pi} \sin x dx$ using 11 ordinates.
 (ii) $\int_0^{\pi/2} \sqrt{\cos \theta} d\theta$ taking 9 ordinates. (V.T.U., 2009)

8. Evaluate correct to 4 decimal places, by Simpson's $\frac{3}{8}$ th rule

(i) $\int_0^9 \frac{dx}{1+x^3}$ (U.P.T.U., M. Tech., 2010) (ii) $\int_0^{\pi/2} e^{\sin x} dx$ (U.P.T.U., 2007)

9. Given that

$x :$	4.0	4.2	4.4	4.6	4.8	5.0	5.2
$\log x :$	1.3863	1.4351	1.4816	1.5261	1.5686	1.6094	1.6487

evaluate $\int_4^{5.2} \log x e^{-x} dx$

- (a) Trapezoidal rule (b) Simpson's 1/3rd rule, (Kerala, 2003)
 (c) Simpson's 3/8th rule (d) Weddle's rule (V.T.U., 2008)

10. Use Romberg's method to compute $\int_0^{\pi/2} \sqrt{\sin x} dx$. (U.P.T.U., 2008)

11. The displacement s of a particle moving along a straight line is given by $s = f(t)$ as a function of time t :

t	5	6	7
$f(t)$	78	70	60

Using Simpson's rule estimate $\int_5^7 s dt$. (J.N.T.U., 2007)

12. A curve is defined by the following table:

$x :$	3.5	4
$y :$	2.6	1

Estimate the area bounded by the curve, the x -axis and the vertical lines $x = 3.5$ and $x = 4$. (Bhopal, 2007)

13. A river is 80 ft wide. The depth d in feet at a distance x ft. from one bank is given by the following table :

$x :$	0	10	20	30	40	50	60	70	80
$y :$	0	4	7	9	12	15	14	8	3

Find approximately the area of the cross-section.

(Rohtak, 2005)

14. A curve is drawn to pass through the points given by following table :

$x :$	1	1.5	2	2.5	3	3.5	4
$y :$	2	2.4	2.7	2.8	3	2.6	2.1

Using Weddle's rule, estimate the area bounded by the curve, the x -axis and the lines $x = 1$, $x = 4$. (V.T.U., 2011 S)

15. A body is in the form of a solid of revolution. The diameter D in cms of its sections at distances x cm. from the one end are given below. Estimate the volume of the solid.

$x :$	0	2.5	5.0	7.5	10.0	12.5	15.0
$D :$	5	5.5	6.0	6.75	6.25	5.5	4.0

16. The velocity v of a particle at distances s from a point on its path is given by the table :

s ft. :	0	10	20	30	40	50	60
v ft/sec. :	47	58	64	65	61	52	38

Estimate the time taken to travel 60 ft. by using Simpson's 1/3 rule.

(U.P.T.U., 2007)

Compare the result with Simpson's 3/8 rule.

(Madras, 2003)

17. The following table gives the velocity v of a particle at time t :

t (second) :	0	2	4	6	8	10	12
v (m/sec) :	4	6	16	34	60	94	136

Find the distance moved by the particle in 12 seconds and also the acceleration at $t = 2$ sec. (S.V.T.U., 2007)

18. A rocket is launched from the ground. Its acceleration is registered during the first 80 seconds and is given in the table below. Using Simpson's $\frac{1}{3}$ rd rule, find the velocity of the rocket at $t = 80$ seconds.

t sec. :	0	10	20	30	40	50	60	70	80
f (cm/sec 2) :	30	31.63	33.34	35.47	37.75	40.33	43.25	46.69	50.67

(Mumbai, 2004)

19. A reservoir discharging water through sluices at a depth h below the water surface has a surface area A for various values of h as given below :

h (ft.) :	10	11	12	13	14
A (sq.ft.) :	950	1070	1200	1350	1550

If t denotes time in minutes, the rate of fall of the surface is given by $dh/dt = -48\sqrt{h}/A$.

Estimate the time taken for the water level to fall from 14 to 10 ft. above the sluices.

30.12 OBJECTIVE TYPE OF QUESTIONS

PROBLEMS 30.3

Select the correct answer or fill up the blanks in the following questions :

- The value of $\int_0^1 \frac{dx}{1+x}$ by Simpson's rule is

(a) 0.96315	(b) 0.63915	(c) 0.69315	(d) 0.62...
-------------	-------------	-------------	-------------
- Using forward differences, the formula for $f'(a) = \dots$
- In application of Simpson's 1/3 rule, the interval h for closer approximation should be ...
- $f(x)$ is given by

$x :$	0	0.5	1
$f(x) :$	1	0.8	0.5,

then using Trapezoidal rule, the value of $\int_0^1 f(x) dx$ is ...

5. If x : 0 0.5 1 1.5 2
 $f(x)$: 0 0.25 1 2.25 4
then the value of $\int_0^2 f(x) dx$ by Simpson's 1/3rd rule is ...

6. Simpson's 3/8th rule states that ...

7. For the data :
 x : 3 6 9 12
 $y(t)$: -1 1 2 3,
the value of $\int_3^{12} y(t) dt$ when computed by Simpson's $\frac{1}{3}$ rd rule is ...
(a) 15 (b) 10 (c) 0 (d) 5.

8. While evaluating a definite integral by Trapezoidal rule, the accuracy can be increased by taking ...

9. The value of $\int_0^1 \frac{dx}{1+x^2}$ by Simpson's 1/3rd rule (taking $n = 1/4$) is ...

10. For the data:
 x : 2 4 6 8
 $f(x)$: 3 5 6 7,
 $\int_2^8 f(x) dx$ when found by the Trapezoidal rule is ...
(a) 18 (b) 25 (c) 16 (d) 32.

11. The expression for $\left(\frac{dy}{dx}\right)_{x=x_0}$ using backward differences is ...

12. The number of strips required in Weddle's rule is ...

13. The number of strips required in Simpson's 3/8th rule is a multiple of
(a) 1 (b) 2 (c) 3 (d) 6.

14. If $y_0 = 1, y_1 = \frac{16}{17}, y_2 = \frac{4}{5}, y_3 = \frac{15}{25}, y_4 = \frac{1}{2}$ and $h = \frac{1}{4}$, then using Trapezoidal rule, $\int_0^4 y dx = ...$

15. Using Simpson's $\frac{1}{3}$ rd rule, $\int_0^4 \frac{dx}{x} = ...$ (taking $n = 4$).

16. If $y_0 = 1, y_1 = 0.5, y_2 = 0.2, y_3 = 0.1, y_4 = 0.06, y_5 = 0.04$ and $y_6 = 0.03$, then $\int_0^4 y dx$ by Simpson's $\frac{3}{8}$ th rule is ...

17. If $f(0) = 1, f(1) = 2.7, f(2) = 7.4, f(3) = 20.1, f(4) = 54.6$ and $h = 1$, then $\int_0^4 f(x) dx$ by Simpson's $\frac{1}{3}$ rd rule = ...

18. Simpson's 1/3rd rule and direct integration give the same result if ...

19. To evaluate $\int_{x_0}^{x_n} y dx$ by Simpson's 1/3rd rule as well as Simpson's 3/8th rule, the number of intervals should be and respectively.

20. Whenever Trapezoidal rule is applicable, Simpson's 1/3rd rule can also be applied. (True or False)

Difference Equations

1. Introduction. 2. Definition. 3. Formation of difference equations. 4. Linear difference equations. 5. Rules for finding complementary function. 6. Rules for finding particular integral. 7. Simultaneous difference equations with constant coefficients. 8. Application to deflection of a loaded string. 9. Objective Type of Questions.

31.1 INTRODUCTION

Difference calculus also forms the basis of Difference equations. These equations arise in all situations in which sequential relation exists at various discrete values of the independent variable. The need to work with discrete functions arises because there are physical phenomena which are inherently of a discrete nature. In control engineering, it often happens that the input is in the form of discrete pulses of short duration. The radar tracking devices receive such discrete pulses from the target which is being tracked. As such differences equations arise in the study of electrical networks, in the theory of probability, in statistical problems and many other fields.

Just as the subject of Differential equations grew out Differential calculus to become one of the most powerful instruments in the hands of a practical mathematician when dealing with continuous processes in nature, so the subject of Difference equations is forcing its way to the fore for the treatment of discrete processes. Thus the difference equations may be thought of as the discrete counterparts of the differential equations.

31.2 DEFINITION

(1) A **difference equation** is a relation between the differences of an unknown function at one or more general values of the argument.

Thus

$$\Delta y_{(n+1)} + y_{(n)} = 2 \quad \dots(1) \quad \text{and} \quad \Delta y_{(n+1)} + \Delta^2 y_{(n-1)} = 1 \quad \dots(2)$$

are difference equations.

An alternative way of writing a difference equation is as under :

Since $\Delta y_{(n+1)} = y_{(n+2)} - y_{(n+1)}$, therefore (1) may be written as

$$y_{(n+2)} - y_{(n+1)} + y_{(n)} = 2 \quad \dots(3)$$

Also since, $\Delta^2 y_{(n-1)} = y_{(n+1)} - 2y_{(n)} + y_{(n-1)}$, therefore (2) takes the form :

$$y_{(n+2)} - 2y_{(n)} + y_{(n-1)} = 1 \quad \dots(4)$$

Quite often, difference equations are met under the name of *recurrence relations*.

(2) **Order of a difference equation** is the difference between the largest and the smallest arguments occurring in the difference equation divided by the unit of increment.

Thus (3) above is the second order, for

$$\frac{\text{largest argument} - \text{smallest argument}}{\text{unit of increment}} = \frac{(n+2) - n}{1} = 2,$$

and (4) is of the third order, for $\frac{(n+2) - (n-1)}{1} = 3$.

Obs. While finding the order of a difference equation, it must always be expressed in a form free of Δx , for the highest power of Δ does not give order of the difference equation.

(3) Solution of a difference equation is an expression for $y_{(n)}$ which satisfies the given difference equation.

The general solution of a difference equation is that in which the number of arbitrary constants is equal to the order of the difference equation.

A particular solution or particular integral is that solution which is obtained from the general solution by giving particular values to the constants.

31.3 FORMATION OF DIFFERENCE EQUATIONS

The following examples illustrate the way in which difference equations arise and are formed.

Example 31.1. Form the difference equation corresponding to the family of curves

$$y = ax + bx^2 \quad \dots(i)$$

Solution. We have $\Delta y = a\Delta(x) + b\Delta(x^2) = a(x+1-x) + b[(x+1)^2 - x^2]$
 $= a + b(2x+1)$ $\dots(ii)$

$$\text{and } \Delta^2 y = 2b[(x+1)-x] = 2b \quad \dots(iii)$$

To eliminate a and b , we have from (iii), $b = \frac{1}{2} \Delta^2 y$

$$\text{and from (ii), } a = \Delta y - b(2x+1) = \Delta y - \frac{1}{2} \Delta^2 y (2x+1)$$

Substituting these values of a and b in (i), we get

$$y = \left[\Delta y - \frac{1}{2} \Delta^2 y (2x+1) \right] x + \frac{1}{2} \Delta^2 y \cdot x^2$$

$$\text{or } (x^2 + x) \Delta^2 y - 2x \Delta y + 2y = 0$$

This is the desired difference equation which may equally well be written in terms of E as

$$(x^2 + x) y_{x+2} - (2x^2 + 4x) y_{x+1} + (x^2 + 3x + 2) y_x = 0.$$

Example 31.2. From $y_n = A2^n + B(-3)^n$, derive a difference equation by eliminating the constants.

Solution. We have $y_n = A2^n + B(-3)^n$, $y_{n+1} = 2A2^n - 3B(-3)^n$
 $\text{and } y_{n+2} = 4A2^n + 9B(-3)^n$.

Eliminating A and B , we get

$$\begin{vmatrix} y_n & 1 & 1 \\ y_{n+1} & 2 & -3 \\ y_{n+2} & 4 & 9 \end{vmatrix} = 0 \quad \text{or } y_{n+2} + y_{n+1} - 6y_n = 0$$

which is the desired difference equation.

PROBLEMS 31.1

- Write the difference equation $\Delta^3 y_x + \Delta^2 y_x + \Delta y_x + y_x = 0$ in the subscript notation.
- Assuming $\frac{\log(1-z)}{1+z} = y_0 + y_1 z + y_2 z^2 + \dots + y_n z^n, \dots$, find the difference equations satisfied by y_n .
- Form a difference equation by eliminating arbitrary constant from $u_n = a2^n + 1$. (Anna, 2008)
- Find the difference equation satisfied by
 $(i) y = a/x + b$ *(Tiruchirappalli, 2001)* $(ii) y = ax^2 - bx$.
- Derive the difference equations in each of the following cases:
 $(i) y_n = A3^n + B5^n$ $(ii) y_n = (A + Bx) 2^n$. (Madras, 2001)
- Form the difference equations generated by
 $(i) y_n = ax + b2^n$ $(ii) y_n = a2^n + b(-2)^n$ $(iii) y_n = a2^n + b3^n + c$.

31.4 LINEAR DIFFERENCE EQUATIONS

(1) **Def.** A linear difference equation is that in which y_{n+1} , y_{n+2} , etc. occur to the first degree only and are not multiplied together.

A linear difference equation with constant coefficient is of the form

$$y_{n+r} + a_1 y_{n+r-1} + a_2 y_{n+r-2} + \dots + a_r y_n = f(n) \quad \dots(1)$$

where a_1, a_2, \dots, a_r are constants.

Now we shall deal with linear difference equations with constant coefficients only. Their properties are analogous to those of linear differential equations with constant co-efficients.

(2) **Elementary properties.** If $u_1(n), u_2(n), \dots, u_r(n)$ be r independent solution of the equation

$$y_{n+r} + a_1 y_{n+r-1} + \dots + a_r y_n = 0 \quad \dots(2)$$

then its complete solution is $U_n = c_1 u_1(n) + \dots + c_r u_r(n)$

where c_1, c_2, \dots, c_r are arbitrary constants.

If V_n is a particular solution of (1), then the complete solution of (1) is $y_n = U_n + V_n$. The part U_n is called the complementary function (C.F.) and the part V_n is called the particular integral (P.I.) of (1).

Thus the complete solution (C.S.) of (1) is $y_n = C.F. + P.I.$

31.5 RULES FOR FINDING THE COMPLEMENTARY FUNCTION

(i.e., rules to solve a linear difference equation with constant coefficients having right hand side zero).

(1) To begin with, consider the first order linear equation $y_{n+1} - \lambda y_n = 0$, where λ is a constant.

Rewriting it as $\frac{y_{n+1}}{\lambda^{n+1}} - \frac{y_n}{\lambda^n} = 0$, we have $\Delta \left(\frac{y_n}{\lambda^n} \right) = 0$, which gives $y_n / \lambda^n = c$, a constant.

Thus the solution of $(E - \lambda) y_n = 0$ is $y_n = c \cdot \lambda^n$.

(2) Now consider the second order linear equation $y_{n+2} + a y_{n+1} + b y_n = 0$ which in symbolic form is

$$(E^2 + aE + b)y_n = 0 \quad \dots(1)$$

Its symbolic co-efficient equated to zero i.e., $E^2 + aE + b = 0$

is called the auxiliary equation. Let its roots be λ_1, λ_2 .

Case I. If these roots are real and distinct, then (1) is equivalent to

$$(E - \lambda_1)(E - \lambda_2)y_n = 0 \quad \dots(2)$$

$$(E - \lambda_2)(E - \lambda_1)y_n = 0 \quad \dots(3)$$

If y_n satisfies the subsidiary equation $(E - \lambda_1)y_n = 0$, then it will also satisfy (3).

Similarly, if y_n satisfies the subsidiary equation $(E - \lambda_2)y_n = 0$, then it will also satisfy (2).

∴ it follows that we can derive two independent solutions of (1), by solving the two subsidiary equations

$$(E - \lambda_1)y_n = 0 \quad \text{and} \quad (E - \lambda_2)y_n = 0$$

Their solutions are respectively, $y_n = c_1(\lambda_1)^n$ and $y_n = c_2(\lambda_2)^n$

where c_1 and c_2 are arbitrary constants.

Thus the general solution of (1) is $y_n = c_1(\lambda_1)^n + c_2(\lambda_2)^n$

Case II. If the roots are real and equal (i.e., $\lambda_1 = \lambda_2$), then (2) becomes

$$(E - \lambda_1)^2 y_n = 0 \quad \dots(4)$$

Let

$$y_n = (\lambda_1)^n z_n$$

where z_n is a new dependent variable. Then (4) takes the form

$$(\lambda_1)^{n+2} z_{n+2} - 2\lambda_1(\lambda_1)^{n+1} z_{n+1} + \lambda_1^2 \cdot (\lambda_1)^n z_n = 0$$

or $z_{n+2} - 2z_{n+1} + z_n = 0$ i.e., $\Delta^2 z_n = 0$

∴ $z_n = c_1 + c_2 n$, where c_1, c_2 are arbitrary constants.

Thus the solution of (1) becomes $y_n = (c_1 + c_2 n)(\lambda_1)^n$.

Case III. If the roots are imaginary, (i.e. $\lambda_1 = \alpha + i\beta$, $\lambda_2 = \alpha - i\beta$) then the solution of (1) is

$$\begin{aligned} y_n &= c_1(\alpha + i\beta)^n + c_2(\alpha - i\beta)^n && [\text{Put } \alpha = r \cos \theta \text{ and } \beta = r \sin \theta] \\ &= r^n [c_1(\cos n\theta + i \sin n\theta) + c_2(\cos n\theta - i \sin n\theta)] \end{aligned}$$

$$= r^n [A_1 \cos n\theta + A_2 \sin n\theta]$$

where A_1, A_2 are arbitrary constants are $r = \sqrt{(\alpha^2 + \beta^2)}$, $\theta = \tan^{-1}(\beta/\alpha)$.

(3) In general, to solve the equation $y_{n+r} + a_r y_{n+r-2} + \dots + a_1 y_n = 0$ where a_i 's are constants :

(i) Write the equation in the symbolic form $(E^r + a_1 E^{r-1} + \dots + a_r)y_n = 0$.

(ii) Write down the auxiliary equation i.e., $E^r + a_1 E^{r-1} + \dots + a_r = 0$ and solve it for E .

(iii) Write the solution as follows :

Roots of A.E.	Solution, i.e. C.F.
1. $\lambda_1, \lambda_2, \lambda_3, \dots$ (real and distinct roots)	$c_1(\lambda_1)^n + c_2(\lambda_2)^n + c_3(\lambda_3)^n + \dots$
2. $\lambda_1, \lambda_1, \lambda_3, \dots$ (2 real and equal roots)	$(c_1 + c_2 n)(\lambda_1)^n + c_3(\lambda_3)^n + \dots$
3. $\lambda_1, \lambda_1, \lambda_1, \dots$ (3 real and equal roots)	$(c_1 + c_2 n + c_3 n^2)(\lambda_1)^n + \dots$
4. $\alpha + i\beta, \alpha - i\beta, \dots$ (a pair of imaginary roots)	$r^n (c_1 \cos \theta + c_2 \sin n\theta)$ where $r = \sqrt{(\alpha^2 + \beta^2)}$ and $\theta = \tan^{-1}(\beta/\alpha)$

Example 31.3. Solve the difference equation $u_{n+3} - 2u_{n+2} - 5u_{n+1} + 6u_n = 0$.

Solution. Given equation in symbolic form is $(E^3 - 2E^2 - 5E + 6)u_n = 0$

∴ its auxiliary equation is $E^3 - 2E^2 - 5E + 6 = 0$

$$\text{or } (E - 1)(E + 2)(E - 3) = 0.$$

$$\therefore E = 1, -2, 3$$

Thus the complete solution is $u_n = c_1(1)^n + c_2(-2)^n + c_3(3)^n$.

Example 31.4. Solve $u_{n+2} - 2u_{n+1} + u_n = 0$.

Solution. Given difference equation in symbolic form is $(E^2 - 2E + 1)u_n = 0$.

∴ its auxiliary equation is $E^2 - 2E + 1 = 0$

$$\text{or } (E - 1)^2 = 0.$$

$$\therefore E = 1, 1$$

Thus the required solution is $u_n = (c_1 + c_2 n)(1)^n$, i.e., $u_n = c_1 + c_2 n$.

Example 31.5. Solve $y_{n+1} - 2y_n \cos \alpha + y_{n-1} = 0$.

Solution. This is a second order difference equation in y_{n-1} ; which in symbolic form is

$$(E^2 - 2E \cos \alpha + 1)y_n = 0$$

The auxiliary equation is $E^2 - 2E \cos \alpha + 1 = 0$

$$E = \frac{2 \cos \alpha \pm \sqrt{(4 \cos^2 \alpha - 4)}}{4} = \cos \alpha \pm i \sin \alpha$$

Thus the solution is $y_{n-1} = (1)^{n-1} [c_1 \cos(n-1)\alpha + c_2 \sin(n-1)\alpha]$

$$\text{or } y_n = c_1 \cos n\alpha + c_2 \sin n\alpha.$$

Example 31.6. The integers 0, 1, 1, 2, 3, 5, 8, 13, 21, ... are said to form a Fibonacci sequence. Form the Fibonacci difference equation and solve it.

Solution. In this sequence, each number beyond the second, is the sum of its two previous numbers. If y_n be the n th number then $y_n = y_{n-1} + y_{n-2}$ for $n > 2$.

$$\text{or } y_{n+2} - y_{n+1} - y_n = 0 \text{ (for } n > 0\text{)}$$

$$\text{or } (E^2 - E - 1)y_n = 0 \text{ is the difference equation.}$$

Its A.E. is $E^2 - E - 1 = 0$ which gives $E = \frac{1}{2}(1 \pm \sqrt{5})$.

Thus the solution is $y_n = c_1 \left(\frac{1 + \sqrt{5}}{2} \right)^n + c_2 \left(\frac{1 - \sqrt{5}}{2} \right)^n$, for $n > 0$

When $n = 1, y = 0$

$$\therefore c_1 \left(\frac{1+\sqrt{5}}{2} \right) + c_2 \left(\frac{1-\sqrt{5}}{2} \right) = 0 \quad \dots(i)$$

When $n = 2, y_2 = 0$

$$\therefore c_1 \left(\frac{1+\sqrt{5}}{2} \right)^2 + c_2 \left(\frac{1-\sqrt{5}}{2} \right)^2 = 0 \quad \dots(ii)$$

Solving (i) and (ii), we get

$$c_1 = \frac{5-\sqrt{5}}{10} \text{ and } c_2 = \frac{5+\sqrt{5}}{10}$$

Hence the complete solution is

$$y_n = \frac{5-\sqrt{5}}{10} \left(\frac{1+\sqrt{5}}{2} \right)^n + \frac{5+\sqrt{5}}{2} \left(\frac{1-\sqrt{5}}{2} \right)^n.$$

PROBLEMS 31.2

Solve the following difference equations :

1. $u_{n+2} - 6u_{n+1} + 9u_n = 0$.
2. $y_{n+2} + y_{n+1} + 2y_n = 0$.
3. $\Delta^2 u_n + 2\Delta u_n + u_n = 0$.
4. $(\Delta^2 - 3\Delta + 2)y_n = 0$.
5. $4y_n - y_{n+2} = 0$ given that $y_0 = 0, y_1 = 2$.
6. $u_{k+3} - 3u_{k+2} + 4u_k = 0$.
7. $f(x+3) - 3f(x+1) - 2f(x) = 0$.
8. $u_{n+3} - 3u_{n+1} + 2u_n = 0$, given $u_1 = 0, u_2 = 8$ and $u_3 = -2$.
9. $(E^3 - 5E^2 + 8E - 4)y_n = 0$, given that $y_0 = 3, y_1 = 2, y_2 = 22$.
10. $u_{n+1} - 2u_n + 2u_{n-1} = 0$.
11. $y_{m+2} + 16y_{m-1} = 0$.

[Hint. $E^4 = -16 = 16 [\cos(2n+1)\pi + i \sin(2n+1)\pi]$; use De Moivre's theorem.]

12. Show that the difference equation $I_{m+1} - (2 + r_0/r)I_m + I_{m-1} = 0$ has the solution

$$I_m = I_0 \sinh(n-m)\alpha / \sinh(n-1)\alpha, \text{ if } I = I_0 \text{ and } I_n = 0, \alpha \text{ being } = 2 \sinh^{-1} \frac{1}{2} (r_0/r)^{1/2}.$$

13. A series of values of y_n satisfy the relation, $y_{n+2} + ay_{n+1} + by_n = 0$.

Given that $y_0 = 0, y_1 = 1, y_2 = y_3 = 2$. Show that $y_n = 2^{n/2} \sin n\pi/4$.

14. A plant is such that each of its seeds when one year old produces 8-fold and produces 18-fold when two years old or more. A seed is planted and as soon as a new seed is produced it is planted. Taking y_n to be the number of seeds produced at the end of the n th year, show that $y_{n+1} = 8y_n + 18(y_1 + y_2 + \dots + y_{n-1})$.

Hence show that $y_{n+2} - 9y_{n+1} - 10y_n = 0$ and find y_n .

31.6 RULES FOR FINDING THE PARTICULAR INTEGRAL

Consider the equation $y_{n+r} + a_1 y_{n+r-1} + \dots + a_r y_n = f(n)$

which in symbolic form is $\phi(E)y_n = f(n)$

where

$$\phi(E) = E^r + a_1 E^{r-1} + \dots + a_r$$

...(1)

Then the particular integral is given by P.I. = $\frac{1}{\phi(E)} f(n)$.

Case I. When $f(n) = a^n$

$$\begin{aligned} \text{P.I.} &= \frac{1}{\phi(E)} a^n, \text{ put } E = a \\ &= \frac{1}{\phi(a)} a^n, \text{ provided } \phi(a) \neq 0 \end{aligned}$$

If $\phi(a) = 0$, then for the equation

$$(i) (E - a)y_n = a^n, \quad \text{P.I.} = \frac{1}{E - a} a^n = n a^{n-1}$$

$$(ii) (E - a)^2 y_n = a^n, \quad P.I. = \frac{1}{(E - a)^2} a^n = \frac{n(n-1)}{2!} a^{n-2}$$

$$(iii) (E - a)^3 y_n = a^n, \quad P.I. = \frac{1}{(E - a)^3} a^n = \frac{n(n-1)(n-2)}{3!} a^{n-3}$$

and so on.

Example 31.7. Solve $y_{n+2} - 4y_{n+1} + 3y_n = 5^n$.

Solution. Given equation in symbolic form is $(E^2 - 4E + 3)y_n = 5^n$

∴ The auxiliary equation is $E^2 - 4E + 3 = 0$

$$\text{or } (E - 1)(E - 3) = 0. \quad \therefore E = 1, 3$$

$$\text{C.F.} = c_1(1)^n + c_2(3)^n = c_1 + c_2 \cdot 3^n$$

and

$$\begin{aligned} \text{P.I.} &= \frac{1}{E^2 - 4E + 3} 5^n && [\text{Put } E = 5] \\ &= \frac{1}{25 - 4 \cdot 5 + 3} 5^n = \frac{1}{8} \cdot 5^n \end{aligned}$$

Thus the complete solution is $y_n = c_1 + c_2 \cdot 3^n + 5^n/8$.

Example 31.8. Solve $u_{n+2} - 4u_{n+1} + 4u_n = 2^n$.

Solution. Given equation in symbolic form is $(E^2 - 4E + 4)u_n = 2^n$.

The auxiliary equation is $E^2 - 4E + 4 = 0. \quad \therefore E = 2, 2$.

$$\text{C.F.} = (c_1 + c_2 n) 2^n$$

$$\text{P.I.} = \frac{1}{(E - 2)^2} \cdot 2^n = \frac{n(n-1)}{2!} \cdot 2^{n-2} = n(n-1) 2^{n-3}$$

Hence the complete solution is $u_n = (c_1 + c_2 n) 2^n + n(n-1) 2^{n-3}$.

Case II. When $f(n) = \sin kn$.

$$\text{P.I.} = \frac{1}{\phi(E)} \sin kn = \frac{1}{\phi(E)} \left(\frac{e^{ikn} - e^{-ikn}}{2i} \right) = \frac{1}{2i} \left[\frac{1}{\phi(E)} a^n - \frac{1}{\phi(E)} b^n \right]$$

where $a = e^{ik}$ and $b = e^{-ik}$.

Now proceed as in case I.

$$\begin{aligned} (2) \text{ When } f(n) = \cos kn &\quad \text{P.I.} = \frac{1}{\phi(E)} \cos kn = \frac{1}{\phi(E)} \left(\frac{e^{ikn} + e^{-ikn}}{2} \right) \\ &= \frac{1}{2} \left[\frac{1}{\phi(E)} a^n + \frac{1}{\phi(E)} b^n \right] \text{ as before} \end{aligned}$$

Now proceed as in case I.

Example 31.9. Solve $y_{n+2} - 2 \cos \alpha \cdot y_{n+1} + y_n = \cos \alpha n$.

(Nagpur, 2008)

Solution. Given equation in symbolic form is $(E^2 - 2 \cos \alpha \cdot E + 1)y_n = \cos \alpha n$.

The auxiliary equation is $E^2 - 2 \cos \alpha \cdot E + 1 = 0$.

$$\therefore E = \frac{2 \cos \alpha \pm \sqrt{(4 \cos^2 \alpha - 4)}}{2} = \cos \alpha \pm i \sin \alpha$$

∴ C.F. = $(1)^n [c_1 \cos \alpha n + c_2 \sin \alpha n]$ i.e., $c_1 \cos \alpha n + c_2 \sin \alpha n$

$$\begin{aligned} \text{P.I.} &= \frac{1}{E^2 - 2E \cos \alpha + 1} \cos \alpha n \\ &= \frac{1}{E^2 - E(e^{i\alpha} + e^{-i\alpha}) + 1} \left(\frac{e^{ian} + e^{-ian}}{2} \right) \end{aligned}$$

$$\begin{aligned}
 &= \frac{1}{2} \left[\frac{1}{(E - e^{i\alpha})(E - e^{-i\alpha})} e^{i\alpha n} + \frac{1}{(E - e^{i\alpha})(E - e^{-i\alpha})} e^{-i\alpha n} \right] \\
 &\quad [\text{Put } E = e^{i\alpha}] \qquad \qquad \qquad [\text{Put } E = e^{-i\alpha}] \\
 &= \frac{1}{2} \left[\frac{1}{(E - e^{i\alpha})} \cdot \frac{1}{e^{i\alpha} - e^{-i\alpha}} e^{i\alpha n} + \frac{1}{E - e^{-i\alpha}} \cdot \frac{1}{e^{-i\alpha} - e^{i\alpha}} e^{-i\alpha n} \right] \\
 &= \frac{1}{4i \sin \alpha} \left[\frac{1}{E - e^{i\alpha}} e^{i\alpha n} - \frac{1}{E - e^{-i\alpha}} e^{-i\alpha n} \right] = \frac{1}{4i \sin \alpha} [n \cdot e^{i\alpha(n-1)} - n \cdot e^{-i\alpha(n-1)}] \\
 &= \frac{n}{2 \sin \alpha} \left[\frac{e^{i\alpha(n-1)} - e^{-i\alpha(n-1)}}{2i} \right] = \frac{n \sin(n-1)\alpha}{2 \sin \alpha}
 \end{aligned}$$

Hence the complete solution is

$$y_n = c_1 \cos \alpha n + c_2 \sin \alpha n + \frac{n \sin(n-1)\alpha}{2 \sin \alpha}.$$

Case III. When $f(n) = n^p$. P.I. = $\frac{1}{\phi(E)} n^p = \frac{1}{\phi(1+\Delta)} n^p$

(1) Expand $[\phi(1+\Delta)]^{-1}$ in ascending powers of Δ by the Binomial theorem as far as the term in Δ^p .

(2) Expand n^p in the factorial form (p. 950) and operate on it with each term of the expansion.

Example 31.10. Solve $y_{n+2} - 4y_n = n^2 + n - 1$.

(Madras, 1999)

Solution. Given equation is $(E^2 - 4)y_n = n^2 + n - 1$.

The auxiliary equation is $E^2 - 4 = 0$, $\therefore E = \pm 2$.

\therefore C.F. = $c_1 (2)^n + c_2 (-2)^n$.

$$\begin{aligned}
 \therefore \text{P.I.} &= \frac{1}{E^2 - 4} (n^2 + n - 1) = \frac{1}{(1 + \Delta)^2 - 4} [n(n-1) + 2n - 1] \\
 &= \frac{1}{\Delta^2 + 2\Delta - 3} ([n]^2 + 2[n] - 1) = -\frac{1}{3} \left[1 - \left(\frac{2}{3}\Delta + \frac{\Delta^2}{3} \right) \right]^{-1} ([n]^2 + 2[n] - 1) \\
 &= -\frac{1}{3} \left[1 + \left(\frac{2}{3}\Delta + \frac{\Delta^2}{3} \right) + \left(\frac{2}{3}\Delta + \frac{\Delta^2}{3} \right) + \dots \right] ([n]^2 + 2[n] - 1) \\
 &= -\frac{1}{3} \left[1 + \frac{2}{3}\Delta + \frac{7}{9}\Delta^2 + \dots \right] ([n]^2 + 2[n] - 1) = -\frac{1}{3} \left[[n]^2 + 2[n] - 1 + \frac{2}{3}(2[n] + 2) + \frac{7}{9} \times 2 \right] \\
 &= -\frac{1}{3} \left[[n]^2 + \frac{10}{3}[n] + \frac{17}{9} \right] = -\frac{n^2}{3} - \frac{7}{9}n - \frac{17}{27}.
 \end{aligned}$$

Hence the complete solution is $y_n = c_1 2^n + c_2 (-2)^n - \frac{n^2}{3} - \frac{7}{9}n - \frac{17}{27}$.

Case IV. When $f(n) = a^n F(n)$, $F(n)$, being a polynomial of finite degree in n .

$$\text{P.I.} = \frac{1}{\phi(E)} a^n F(n) = a^n \frac{1}{\phi(aE)} F(a)$$

Now $F(n)$ being a polynomial in n , proceed as in case III.

Example 31.11. Solve $y_{n+2} - 2y_{n+1} + y_n = n^2 \cdot 2^n$.

(Nagpur, 2008)

Solution. Given equation is $(E^2 - 2E + 1)y_n = n^2 \cdot 2^n$.

Its C.F. = $c_1 + c_2 n$

and P.I. = $\frac{1}{(E-1)^2} 2^n \cdot n^2 = 2^n \frac{1}{(2E-1)^2} n^2 = 2^n \frac{1}{(1+2\Delta)^2} n^2$

$$\begin{aligned} &= 2^n (1 + 2\Delta)^{-2} n(n-1) + n = 2^n (1 - 4\Delta + 12\Delta^2 - \dots) ([n]^2 + [n]) \\ &= 2^n ([n]^2 + [n] - 4(2[n] + 1) + 12 \times 2) \\ &= 2^n ([n]^2 - 7[n] + 20) = 2^n (n^2 - 8n + 20) \end{aligned}$$

Hence the complete solution is $y_n = c_1 + c_2 n + 2^n (n^2 - 8n + 20)$.

PROBLEMS 31.3

Solve the following difference equations:

1. $y_{n+2} - 5y_{n+1} - 6y_n = 4^n, y_0 = 0, y_1 = 1.$

(Madras, 2003)

2. $y_{n+2} + 6y_{n+1} + 9y_n = 2^n, y_0 = y_1 = 0.$

(V.T.U., 2009)

3. $y_{p+2} - 3y_{p+1} - 3y_p = 1.$

(Kottayam, 2005)

4. $y_{p+2} - 2y_{p+1} + 4y_p = 6,$ given that $y_0 = 0$ and $y_1 = 2.$

6. $y_{z+2} - 4y_{z+1} + 4y_z = 3.2^z + 5.4^z.$

5. $(E^2 - 4E + 3)y = 3^x.$

8. $y_{p+2} - \left(2 \cos \frac{1}{2}\right) y_{p+1} + y_p = \sin p/2.$

7. $u_{n+2} - u_n = \cos n/2.$ (Madras, 2001 S)

10. $y_{n+3} + y_n = n^2 + 1, y_0 = y_1 = y_2 = 0.$

(Tiruchirappalli, 2001)

9. $(E^2 - 4)y = x^2 - 1.$

11. $y_{n+3} - 5y_{n+2} + 3y_{n+1} + 9y_n = 2^n + 3n.$

(Nagpur, 2009)

12. $(4E^2 - 4E + 1)y = 2^x + 2^{x-1}.$ (Madras, 2001)

13. $y_{n+2} + 5y_{n+1} + 6y_n = n + 2^n.$

(Nagpur, 2006)

14. $u_{z+2} + 6u_{z+1} + 9u_z = x^{2z} + 3^z + 7.$

15. $y_{n+3} + 8y_n = (2n + 3) 2^n.$

(Nagpur, 2005)

16. $u_{n+2} - 4u_{n+1} + 4u_n = n^2 2^n.$

17. $(E^2 - 5E + 6)y = 4^k (k^2 - k + 5).$

18. $(E^2 - 2E + 4)y_n = -2^x \left\{ 6 \cos \frac{n\pi}{3} + 2\sqrt{3} \sin \frac{n\pi}{3} \right\}.$

19. A beam of length $l,$ supported at n points carries a uniform load w per unit length. The bending moments M_1, M_2, \dots, M_n at the supports satisfy the Clapeyron's equation :

$$M_{z+2} + 4M_{z+1} + M_z = -\frac{1}{2} wl^2$$

If a beam weighing 30 kg is supported at its ends and at two other supports dividing the beam into three equal parts of 1 metre length, show that the bending moment at each of the two middle supports is $1 \text{ kg metre}.$

31.7 SIMULTANEOUS DIFFERENCE EQUATIONS WITH CONSTANT COEFFICIENTS

The method used for solving simultaneous differential equations with constant coefficients also applies to simultaneous difference equations with constants coefficients. The following example illustrates the technique.

Example 31.12. Solve the simultaneous difference equations

$$u_{z+1} + v_z - 3u_z = x, \quad 3u_z + v_{z+1} - 5v_z = 4^x$$

subject to the conditions $u_1 = 2, v_1 = 0.$

Solution. Given equation in symbolic form, are

$$(E - 3)u_z + v_z = x \quad \dots(i)$$

$$3u_z + (E - 5)v_z = 4^x \quad \dots(ii)$$

Operating the first equation with $E - 5$ and subtracting the second from it, we get

$$(E - 5)(E - 3) - 3|u_z = (E - 5)x - 4^x$$

or

$$(E^2 - 8E + 12)u_z = 1 - 4x - 4^x$$

Its solution is $u_z = c_1 2^z + c_2 6^z - \frac{4}{5}x - \frac{19}{25} + \frac{4^z}{4} \quad \dots(iii)$

Substituting the value of u_z from (iii) in (i), we get

$$v_z = c_1 2^z - 3c_2 6^z - \frac{3x}{5} - \frac{34}{25} - \frac{4^z}{4} \quad \dots(iv)$$

Taking $u_1 = 2, v_1 = 0,$ in (iii) and (iv), we obtain

$$2c_1 + 6c_2 = \frac{64}{25}, \quad 2c_1 - 18c_2 = \frac{74}{25}$$

when

$$c_1 = 1.33, \quad c_2 = -0.0167$$

Hence

$$u_x = 1.33.2^x - 0.0167.6^x - 0.8x - 0.76 + 4^{x-1}$$

$$u_x = 1.33.2^x - 0.05.6^x - 0.6x - 1.36 - 4^{x-1}.$$

PROBLEMS 31.4

Solve the following simultaneous difference equations :

1. $y_{x+1} - z_x = 2(x+1)$, $z_{x+1} - y_x = -2(x+1)$.
2. $y_{n+1} - y_n + 2z_{n+1} = 0$, $z_{n+1} - z_n - 2y_n = 2^n$.
3. $u_{n+1} + n = 3u_n + 2v_n$, $v_{n+1} - n = u_n + 2v_n$, given $u_0 = 0$, $v_0 = 3$.
4. $u_{x+1} + v_x + w_x = 1$, $u_x + v_{x+1} + w_x = x$, $u_x + v_x + w_{x+1} = 2x$.

31.8 APPLICATION TO DEFLECTION OF A LOADED STRING

Consider a light string of length l stretched tightly between A and B . Let the forces P_i be acting at its equispaced points x_i ($i = 1, 2, \dots, n-1$) and perpendicular to AB resulting in small transverse displacements y_i at these points (Fig. 31.1). Assuming the angle θ_i made by the portion between x_i and x_{i+1} with the horizontal, to be small, we have

$$\sin \theta_i = \tan \theta_i = \theta_i \text{ and } \cos \theta_i = 1$$

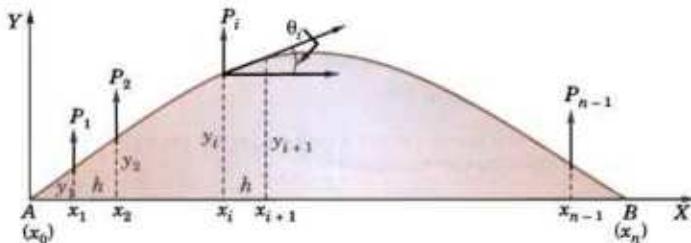

Fig. 31.1

If T be the tension of the string at x_i , then $T \cos \theta_i = T$
i.e., the tension may be taken as uniform.

Taking $x_{i+1} - x_i = h$, we have

$$y_{i+1} - y_i = h \tan \theta_i = h \theta_i \quad \dots(1)$$

$$y_i - y_{i-1} = h \tan \theta_{i-1} = h \theta_{i-1} \quad \dots(2)$$

Also resolving the forces in equilibrium at (x_i, y_i) \perp to AB , we get

$$T \sin \theta_i - T \sin \theta_{i-1} + P_i = 0 \text{ i.e. } T(\theta_i - \theta_{i-1}) + P_i = 0 \quad \dots(3)$$

Eliminating θ_i and θ_{i-1} from (1), (2) and (3), we obtain

$$y_{i+1} - 2y_i + y_{i-1} = -\frac{hP_i}{T} \quad \dots(4)$$

which is a difference equation and its solution gives the displacements y_i . To obtain the arbitrary constants in the solution, we take $y_0 = y_n = 0$ as the boundary conditions, since the ends A and B of the string are fixed.

Example 31.13. A light string stretched between two fixed nails 120 cm apart, carries 11 loads of weight 5 gm each at equal intervals and the resulting tension is 500 gm wt. Show that the sag at the mid-point is 1.8 cm.

Solution. Taking $h = 10$ cm, $P_i = 5$ gm and $T = 500$ gm wt., the above equation (4) becomes $y_{i+1} - 2y_i + y_{i-1} = -\frac{1}{10}$

i.e.,

$$y_{i+2} - 2y_{i+1} + y_i = -\frac{1}{10}$$

Its A.E. is $(E-1)^2 = 0$ i.e. $E = 1, 1$. \therefore C.F. = $c_1 + c_2 i$

and

$$\text{P.I.} = \frac{1}{(E-1)^2} \left(-\frac{1}{10} \right) = -\frac{1}{10} \frac{1}{(E-1)^2} (1)^i = -\frac{1}{10} \frac{i(i-1)}{2} = \frac{1}{20} (i-i^2)$$

Thus the C.S. is $y_i = c_1 + c_2 i + \frac{1}{20} (i - i^2)$

Since $y_0 = 0$, $\therefore c_1 = 0$

and $y_{12} = 0$, $\therefore c_2 = \frac{11}{20}$.

Hence $y_i = \frac{11}{20} i + \frac{1}{20} (i - i^2)$

At the mid-point $i = 6$, we get $y_6 = 1.8$ cm.

PROBLEMS 31.5

1. A light string of length $(n+1)\ell$ is stretched between two fixed points with a force P . It is loaded with n equal masses m at distance ℓ . If the system starts rotating with angular velocity ω , find the displacement y_i of the i th mass.

31.9 OBJECTIVE TYPE OF QUESTIONS

PROBLEMS 31.6

Select the correct answer or fill up the blanks in the following questions:

1. $y_n = A 2^n + B 3^n$ is the solution of the difference equation
2. The solution of $(E-1)^2 u_n = 0$ is
3. The solution of the difference equation $u_{n+3} - 2u_{n+2} - 5u_{n+1} + 6u_n = 0$ is
4. The solution of $y_{n+1} - y_n = 2^n$ is
5. The difference equation $y_{n+1} - 2y_n = n$ has $y_n = \dots$ as its solution.
6. The difference equation corresponding to the family of curves $y = ax^2 + bx$ is
7. The particular integral of the equation $(E-2)y_n = 1$.
8. The solution of $4y_n = y_{n+2}$ such that $y_0 = 0, y_1 = 2$, is
9. The equation $\Delta^2 u_{n+1} + \frac{1}{2} \Delta^2 u_n = 0$ is of order
10. The difference equation satisfied by $y = a + b/x$ is
11. The order of the difference equation $y_{n+2} - 2y_{n+1} + y_n = 0$ is
12. The solution of $y_{n+2} - 4y_{n+1} + 4y_n = 0$ is
13. The particular integral of $u_{n+2} - 6u_{n+1} + 9u_n = 3$ is
14. The difference equation generated by $u_n = (a + bn) 3^n$ is
15. Solution of $6y_{n+2} + 5y_{n+1} - 6y_n = 2^n$ is $y_n = A(2/3)^n + B(-3/2)^n + 2^n/28$.

32.1 INTRODUCTION

The methods of solution so far presented are applicable to a limited class of differential equations. Frequently differential equations appearing in physical problems do not belong to any of these familiar types and one is obliged to resort to numerical methods. These methods are of even greater importance when we realise that computing machines are now available which reduce numerical work considerably.

A number of numerical methods are available for the solution of first order differential equations of the form :

$$\frac{dy}{dx} = f(x, y), \text{ given } y(x_0) = y_0 \quad \dots(1)$$

These methods yield solutions either as a power series in x from which the values of y can be found by direct substitution, or as a set of values of x and y . The methods of Picard and Taylor series belong to the former class of solutions whereas those of Euler, Runge-Kutta, Milne, Adams-Bashforth etc. belong to the latter class. In these later methods, the values of y are calculated in short steps for equal intervals of x and are therefore, termed as *step-by-step methods*.

Euler and Runge-Kutta methods are used for computing y over a limited range of x -values whereas Milne and Adams-Bashforth methods may be applied for finding y over a wider range of x -values. These later methods require starting values which are found by Picard's or Taylor series or Runge-Kutta methods.

The initial condition in (1) is specified at the point x_0 . Such problems in which all the initial conditions are given at the initial point only are called **initial value problems**. But there are problems involving second and higher order differential equations in which the conditions may be given at two or more points. These are known as **boundary value problems**. In this chapter, we shall first explain methods for solving initial value problems and then give a method of solving boundary value problems.

32.2 PICARD'S METHOD*

Consider the first order equation $dy/dx = f(x, y)$

...(1)

* Called after the French mathematician Emile Picard (1856–1941) who was professor in Paris since 1881 and is famous for his researches in the theory of functions.

It is required to find that particular solution of (1) which assumes the value y_0 when $x = x_0$. Integrating (1) between limits, we get

$$\int_{y_0}^y dy = \int_{x_0}^x f(x, y) dx \quad \text{or} \quad y = y_0 + \int_{x_0}^x f(x, y) dx \quad \dots(2)$$

This is an integral equation equivalent to (1), for it contains the unknown y under the integral sign.

As a first approximation y_1 to the solution, we put $y = y_0$ in $f(x, y)$ and integrate (2), giving

$$y_1 = y_0 + \int_{x_0}^x f(x, y_0) dx$$

For a second approximation y_2 , we put $y = y_1$ in $f(x, y)$ and integrate (2), giving

$$y_2 = y_0 + \int_{x_0}^x f(x, y_1) dx.$$

Similarly, a third approximation is $y_3 = y_0 + \int_{x_0}^x f(x, y_2) dx$.

Continuing this process, a sequence of functions of x , i.e., $y_1, y_2, y_3 \dots$ is obtained each giving a better approximation of the desired solution than the preceding one.

Obs. Picard's method is of considerable theoretical value, but can be applied only to a limited class of equations in which the successive integrations can be performed easily. The method can be extended to simultaneous equations and equations of higher order (See § 32.11 and 32.12).

Example 32.1. Using Picard's process of successive approximation, obtain a solution upto the fifth approximation of the equation $dy/dx = y + x$, such that $y = 1$ when $x = 0$. Check your answer by finding the exact particular solution.

Solution. (a) We have $y = 1 + \int_0^x (y + x) dx$.

First approximation. Put $y = 1$, in $y + x$, giving

$$y_1 = 1 + \int_0^x (1+x) dx = 1 + x + x^2/2.$$

Second approximation. Put $y = 1 + x + x^2/2$ in $y + x$, giving

$$y_2 = 1 + \int_0^x (1+2x+x^2/2) dx = 1 + x + x^2 + x^3/6.$$

Third approximation. Put $y = 1 + x + x^2 + x^3/6$ in $y + x$, giving

$$y_3 = 1 + \int_0^x (1+2x+x^2+x^3/6) dx = 1 + x + x^2 + \frac{x^3}{3} + \frac{x^4}{24}.$$

Fourth approximation. Put $y = y_3$ in $y + x$, giving

$$y_4 = 1 + \int_0^x \left(1+2x+x^2+\frac{x^3}{3}+\frac{x^4}{24}\right) dx = 1 + x + x^2 + \frac{x^3}{3} + \frac{x^4}{12} + \frac{x^5}{120}.$$

Fifth approximation. Put $y = y_4$ in $y + x$, giving

$$y_5 = 1 + \int_0^x \left(1+2x+x^2+\frac{x^3}{3}+\frac{x^4}{12}+\frac{x^5}{120}\right) dx = 1 + x + x^2 + \frac{x^3}{3} + \frac{x^4}{12} + \frac{x^5}{60} + \frac{x^6}{720} \quad \dots(i)$$

(b) Given equation :

$$\frac{dy}{dx} - y = x \text{ is a Leibnitz's linear in } x.$$

Its I.F. being e^{-x} , the solution is

$$ye^{-x} = \int xe^{-x} dx + c = -xe^{-x} - \int (-e^{-x}) dx + c = -xe^{-x} - e^{-x} + c \quad [\text{Integrate by parts}]$$

$$\therefore y = ce^x - x - 1.$$

Since $y = 1$, when $x = 0$, $\therefore c = 2$.

Thus the desired particular solution is $y = 2e^x - x - 1$

... (ii)

Or using the series : $e^x = 1 + x + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \dots \infty$,

we get $y = 1 + x + x^2 + \frac{x^3}{3} + \frac{x^4}{12} + \frac{x^5}{60} + \frac{x^6}{360} + \dots \infty$... (iii)

Comparing (i) and (iii), it is clear that (i) approximates to the exact particular solution (ii) upto the term in x^5 .

Obs. At $x = 1$, the fourth approximation $y_4 = 3.433$ and the fifth approximation $y_5 = 3.434$ whereas exact value is 3.44.

Example 32.2. Find the value of y for $x = 0.1$ by Picard's method, given that

$$\frac{dy}{dx} = \frac{y-x}{y+x}, \quad y(0) = 1. \quad (\text{P.T.U., 2002})$$

Solution. We have $y = 1 + \int_0^x \frac{y-x}{y+x} dx$

First approximation. Put $y = 1$ in the integrand, giving

$$\begin{aligned} y_1 &= 1 + \int_0^x \frac{1-x}{1+x} dx = 1 + \int_0^x \left(-1 + \frac{2}{1+x} \right) dx \\ &= 1 + [-x + 2 \log(1+x)]_0^x = 1 - x + 2 \log(1+x) \end{aligned} \quad \dots(i)$$

Second approximation. Put $y = 1 - x + 2 \log(1+x)$ in the integrand, giving

$$y_2 = 1 + \int_0^x \frac{1-x+2 \log(1+x)-x}{1-x+2 \log(1+x)+x} dx = 1 + \int_0^x \left[1 - \frac{2x}{1+2 \log(1+x)} \right] dx$$

which is very difficult to integrate.

Hence we use the first approximation and taking $x = 0.1$ in (i) we obtain

$$y(0.1) = 1 - (.1) + 2 \log 1.1 = 0.9828.$$

32.3 | TAYLOR'S SERIES METHOD*

Consider the first order equation $dy/dx = f(x, y)$... (1)

Differentiating (1), we have

$$\frac{d^2y}{dx^2} = \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} \frac{dy}{dx} \quad \text{i.e.,} \quad y'' = f_x + f_y f' \quad \dots(2)$$

Differentiating this successively, we can get $y''', y^{(iv)}$ etc. Putting $x = x_0$ and $y = 0$, the values of $(y')_0, (y'')_0, (y''')_0$ can be obtained. Hence the Taylor's series

$$y(x) = y_0 + (x - x_0)(y')_0 + \frac{(x - x_0)^2}{2!}(y'')_0 + \frac{(x - x_0)^3}{3!}(y''')_0 + \dots \quad \dots(3)$$

gives the values of y for every value of x for which (3) converges.

On finding the value y_1 for $x = x_1$ from (3), y', y'' can be evaluated at $x = x_1$ by means of (1), (2) etc. Then y can be expanded about $x = x_1$. In this way, the solution can be extended beyond the range of convergence of series (3).

Example 32.3. Find by Taylor's series method the value of y at $x = 0.1$ and $x = \dots$ to five places of decimals from $dy/dx = x^2y - 1, y(0) = 1$. (V.T.U., 2002; M.T.U., 2003)

Solution. Here $(y)_0 = 1, y' = x^2y - 1, (y')_0 = -1$

\therefore Differentiating successively and substituting, we get

$$\begin{aligned} y'' &= 2xy + x^2y', & (y'')_0 &= 0 \\ y''' &= 2y + 4xy' + x^2y'', & (y''')_0 &= 2 \\ y^{(iv)} &= 6y' + 6xy'' + x^2y''', & (y^{(iv)})_0 &= -6 \text{ etc.} \end{aligned}$$

*See footnote p. 145.

Putting these values in the Taylor's series,

$$y(x) = y_0 + xy'(0) + \frac{x^2}{2!} y''(0) + \frac{x^3}{3!} y'''(0) + \frac{x^4}{4!} y^{(iv)}(0) + \dots$$

we have $y(x) = 1 + x(-1) + \frac{x^2}{2!}(0) + \frac{x^3}{3!}(2) + \frac{x^4}{4!}(-6) + \dots = 1 - x + \frac{x^3}{3} - \frac{x^4}{4} + \dots$

Hence $y(0.1) = 0.90033$ and $y(0.2) = 0.80227$.

Example 32.4. Employ Taylor's method to obtain approximate value of y at $x = 0.2$ for the differential equation $dy/dx = 2y + 3e^x$, $y(0) = 0$. Compare the numerical solution obtained with the exact solution.

(V.T.U., 2009 ; P.T.U., 2003)

Solution. (a) We have $y' = 2y + 3e^x$ $y'(0) = 2y(0) + 3e^0 = 3$.

Differentiating successively and substituting $x = 0$, $y = 0$, we get

$$y'' = 2y' + 3e^x, \quad y''(0) = 2y'(0) + 3 = 9$$

$$y''' = 2y'' + 3e^x, \quad y'''(0) = 2y''(0) + 3 = 21$$

$$y^{(iv)} = 2y''' + 3e^x, \quad y^{(iv)}(0) = 2y'''(0) + 3 = 45 \text{ etc.}$$

Putting these values in the Taylor's series, we have

$$\begin{aligned} y(x) &= y(0) + xy'(0) + \frac{x^2}{2!} y''(0) + \frac{x^3}{3!} y'''(0) + \frac{x^4}{4!} y^{(iv)}(0) + \dots \\ &= 0 + 3x + \frac{9}{2} x^2 + \frac{21}{6} x^3 + \frac{45}{24} x^4 + \dots = 3x + \frac{9}{2} x^2 + \frac{7}{2} x^3 + \frac{15}{8} x^4 + \dots \end{aligned}$$

Hence $y(0.2) = 3(0.2) + 4.5(0.2)^2 + 3.5(0.2)^3 + 1.875(0.4)^4 + \dots = 0.8116$... (i)

(b) Now $\frac{dy}{dx} - 2y = 3e^x$ is a Leibnitz's linear in x .

Its I.F. being e^{-2x} , the solution is

$$ye^{-2x} = \int 3e^x \cdot e^{-2x} dx + c = -3e^{-x} + c \quad \text{or} \quad y = -3e^x + ce^{2x}$$

Since $y = 0$ when $x = 0$, $\therefore c = 3$.

Thus the exact solution is $y = 3(e^{2x} - e^x)$

When $x = 0.2$, $y = 3(e^{0.4} - e^{0.2}) = 0.8112$... (ii)

Comparing (i) and (ii), it is clear that (i) approximates to the exact value upto 3 decimal places.

Example 32.5. Solve by Taylor's series method the equation $\frac{dy}{dx} = \log(xy)$ for $y(1.1)$ and $y(1.2)$, given $y(1) = 2$

(Hazaribagh, 2009)

Solution. We have $y' = \log x + \log y$; $y'(1) = \log 2$

Differentiating w.r.t. x and substituting $x = 1$, $y = 2$, we get

$$y'' = \frac{1}{x} + \frac{1}{y} y'; \quad y''(1) = 1 + \frac{1}{2} \log 2$$

$$y''' = -\frac{1}{x^2} + \frac{1}{y} + y'' + y' \left(-\frac{1}{y^2} \right) y'; \quad y'''(1) = -1 + \frac{1}{2} \left(1 + \frac{1}{2} \log 2 \right) - \frac{1}{4} (\log 2)^2$$

Substituting these values in the Taylor's series about $x = 1$, we have

$$y(x) = y(1) + (x-1)y'(1) + \frac{(x-1)^2}{2!} y''(1) + \frac{(x-1)^3}{3!} y'''(1) + \dots$$

$$= 2 + (x-1) \log 2 + \frac{1}{2} (x-1)^2 \left(1 + \frac{1}{2} \log 2 \right) + \frac{1}{6} (x-1)^3 \left[-\frac{1}{2} + \frac{1}{4} \log 2 - \frac{1}{4} (\log 2)^2 \right]$$

$$\therefore y(1.1) = 2 + (0.1) \log 2 + \frac{(0.1)^2}{2} \left(1 + \frac{1}{2} \log 2 \right) + \frac{(0.1)^3}{6} \left[-\frac{1}{2} + \frac{1}{4} \log 2 - \frac{1}{4} (\log 2)^2 \right] = 2.036$$

$$y(1.2) = 2 + (0.2) \log 2 + \frac{(0.2)^2}{2} \left(1 + \frac{1}{2} \log 2 \right) + \frac{(0.2)^3}{6} \left[-\frac{1}{2} + \frac{1}{4} \log 2 - \frac{1}{4} (\log 2)^2 \right] = 2.081.$$

PROBLEMS 32.1

- Using Picard's method, solve $dy/dx = -xy$ with $x_0 = 0, y_0 = 1$ upto third approximation. (Mumbai, 2005)
- Employ Picard's method to obtain, correct to four places of decimal, solution of the differential equation $dy/dx = x^2 + y^2$ for $x = 0.4$, given that $y = 0$ when $x = 0$. (J.N.T.U., 2009)
- Obtain Picard's second approximate solution of the initial value problem : $y' = x^2/(y^2 + 1), y(0) = 0$. (Marathwada, 2008)
- Find an approximate value of y when $x = 0.1$, if $dy/dx = x - y^2$ and $y = 1$ at $x = 0$, using
 - Picard's method
 - Taylor's series.
(V.T.U., 2010 ; Madras, 2006)
- Solve $y' = x + y$ given $y(1) = 0$. Find $y(1.1)$ and $y(1.2)$ by Taylor's method. Compare the result with its exact value. (J.N.T.U., 2008 ; Anna, 2005)
- Evaluate $y(0.1)$ correct to six places of decimals by Taylor's series method if $y(x)$ satisfies $y' = xy + 1, y(0) = 1$.
- Solve $y' = 3x + y^2, y(0) = 1$ using Taylor's series method and computer $y(0.1)$. (Mumbai, 2007)
- Using Taylor series method, find $y(0.1)$ correct to 3-decimal places given that $dy/dx = e^x - y^2, y(0) = 1$.

32.4 EULER'S METHOD*

Consider the equation $\frac{dy}{dx} = f(x, y) \quad \dots(1)$

given that $y(x_0) = y_0$. Its curve of solution through $P(x_0, y_0)$ is shown dotted in Fig. 32.1. Now we have to find the ordinate of any other point Q on this curve.

Let us divide LM into n sub-intervals each of width h at L_1, L_2, \dots so that h is quite small. In the interval LL_1 , we approximate the curve by the tangent at P . If the ordinate through L_1 meets this tangent in $P_1(x_0 + h, y_1)$, then

$$\begin{aligned} y_1 &= L_1 P_1 = LP + R_1 P_1 \\ &= y_0 + PR_1 \tan \theta = y_0 + h \left(\frac{dy}{dx} \right)_P \\ &= y_0 + h f(x_0, y_0) \end{aligned}$$

Let $P_1 Q_1$ be the curve of solution of (1) through P_1 and let its tangent at P_1 meet the ordinate through L_2 in $P_2(x_0 + 2h, y_2)$. Then

$$y_2 = y_1 + h f(x_0 + h, y_1) \quad \dots(2)$$

Repeating this process n times, we finally reach an approximation MP_n of MQ given by

$$y_n = y_{n-1} + h f(x_0 + (n-1)h, y_{n-1})$$

This is Euler's method of finding an approximate solution of (1).

Obs. In Euler's method, we approximate the curve of solution by the tangent in each interval, i.e. by a sequence of short lines. Unless h is small, the error is bound to be quite significant. This sequence of lines may also deviate considerably from the curve of solution. Hence there is a modification of this method which is given in the next section.

Example 32.6. Using Euler's method, find an approximate value of y corresponding to $x = 1$, given that $dy/dx = x + y$ and $y = 1$ when $x = 0$. (Mumbai, 2005 ; Rohtak, 2003)

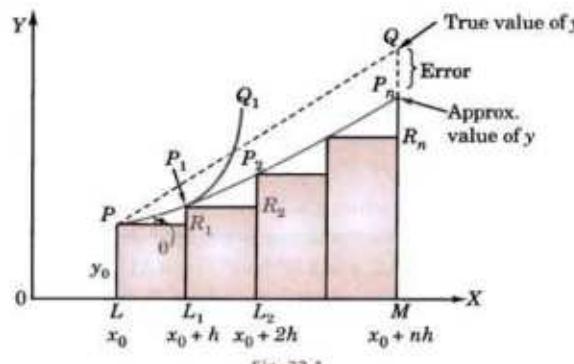

Fig. 32.1

Solution. We take $n = 10$ and $h = 0.1$ which is sufficiently small. The various calculations are arranged as follows :

x	y	$x + y = dy/dx$	$Old\ y + 0.1(dy/dx) = new\ y$
0.0	1.00	1.00	$1.00 + 0.1(1.00) = 1.10$
0.1	1.10	1.20	$1.10 + 0.1(1.20) = 1.22$
0.2	1.22	1.42	$1.22 + 0.1(1.42) = 1.36$
0.3	1.36	1.66	$1.36 + 0.1(1.66) = 1.53$
0.4	1.53	1.93	$1.53 + 0.1(1.93) = 1.72$
0.5	1.72	2.22	$1.72 + 0.1(2.22) = 1.94$
0.6	1.94	2.54	$1.94 + 0.1(2.54) = 2.19$
0.7	2.19	2.89	$2.19 + 0.1(2.89) = 2.48$
0.8	2.48	3.89	$2.48 + 0.1(3.89) = 2.81$
0.9	2.81	3.71	$2.81 + 0.1(3.71) = 3.18$
1.0	3.18		

Thus the required approximate value of $y = 3.18$.

Obs. In example 32.1, the true value of y from its exact solution at $x = 1$ is 3.44 whereas by Euler's method $y = 3.18$ and by Picard's method $y = 3.434$. In the above solution, had we chosen $n = 20$, the accuracy would have been considerably increased but at the expense of double the labour of computation. Euler's method is no doubt very simple but cannot be considered as one of the best.

Example 32.7. Given $\frac{dy}{dx} = \frac{y - x}{y + x}$ with initial condition $y = 1$ at $x = 0$; find y for $x = 0.1$ by Euler's method.

(P.T.U., 2001)

Solution. We divide the interval $(0, 0.1)$ into five steps i.e. we take $n = 5$ and $h = 0.02$. The various calculations are arranged as follows :

x	y	$(y - x)/(y + x) = dy/dx$	$Old\ y + 0.02(dy/dx) = new\ y$
0.00	1.0000	1.0000	$1.0000 + 0.02(1.0000) = 1.0200$
0.02	1.0200	0.9615	$1.0200 + 0.02(0.9615) = 1.0392$
0.04	1.0392	0.926	$1.0392 + 0.02(0.926) = 1.0577$
0.06	1.0577	0.893	$1.0577 + 0.02(0.893) = 1.0756$
0.08	1.0756	0.862	$1.0756 + 0.02(0.862) = 1.0928$
0.10	1.0928		

Hence the required approximate value of $y = 1.0928$.

32.5 MODIFIED EULER'S METHOD

In the Euler's method, the curve of solution in the interval LL_1 is approximated by the tangent at P (Fig. 32.1) such that at P_1 , we have

$$y_1 = y_0 + h f(x_0, y_0) \quad \dots(1)$$

Then the slope of the curve of solution through P_1 [i.e. $(dy/dx)_{P_1} = f(x_0 + h, y_1)$] is computed and the tangent at P_1 to P_1Q_1 is drawn meeting the ordinate through L_2 in $P_2(x_0 + 2h, y_2)$.

Now we find a better approximation $y_1^{(1)}$ of $y(x_0 + h)$ by taking the slope of the curve as the mean of the slopes of the tangents at P and P_1 , i.e.

$$y_1^{(1)} = y_0 + \frac{h}{2} [f(x_0, y_0) + f(x_0 + h, y_1)] \quad \dots(2)$$

As the slope of the tangent at P_1 is not known, we take y_1 as found in (1) by Euler's method and insert it on R.H.S. of (2) to obtain the first modified value $y_1^{(1)}$. The equation (1) is therefore, called the *predictor* while (2) serves as the *corrector of y_1* .

Again the corrector is applied and we find a still better value $y_1^{(2)}$ corresponding to L_1 as

$$y_1^{(2)} = y_0 + \frac{h}{2} [f(x_0, y_0) + f(x_0 + h, y_1^{(1)})]$$

We repeat this step, till two consecutive values of y agree. This is then taken as the starting point for the next interval $L_1 L_2$.

Once y_1 is obtained to desired degree of accuracy, y corresponding to L_2 is found from the predictor

$$y_2 = y_1 + hf(x_0 + h, y_1)$$

and a better approximation $y_2^{(1)}$ is obtained from the corrector

$$y_2^{(1)} = y_1 + \frac{h}{2} [f(x_0 + h, y_1) + f(x_0 + 2h, y_2)].$$

We repeat this step until y_2 becomes stationary. Then we proceed to calculate y_3 as above and so on. This is the modified Euler's method which is a predictor-corrector method.

Example 32.8. Using modified Euler's method, find an approximate value of y when $x = 0.3$, given that $dy/dx = x + y$ and $y = 1$ when $x = 0$.
(Rohtak, 2005; Bhopal, 2002 S; Delhi, 2002)

Solution. Taking $h = 0.1$, the various calculations are arranged as follows :

x	$x + y = y'$	Mean slope	$Old\ y + 0.1\ (mean\ slope) = new\ y$
0.0	0 + 1	—	1.00 + 0.1 (1.00) = 1.10
0.1	.1 + 1.1	$\frac{1}{2}(1 + 1.2)$	1.10 + 0.1 (1.1) = 1.11
0.1	.1 + 1.11	$\frac{1}{2}(1 + 1.21)$	1.10 + 0.1 (1.105) = 1.1105
0.1	.1 + 1.1105	$\frac{1}{2}(1 + 1.2105)$	1.10 + 0.1 (1.1052) = 1.1105
0.1	1.2105	—	1.1105 + 0.1 (1.2105) = 1.2316
0.2	.2 + 1.2316	$\frac{1}{2}(1.2105 + 1.4316)$	1.2316 + 0.1 (1.3211) = 1.2426
0.2	.2 + 1.2426	$\frac{1}{2}(1.2105 + 1.4426)$	1.2316 + 0.1 (1.3266) = 1.2432
0.2	.2 + 1.2432	$\frac{1}{2}(1.2105 + 1.4432)$	1.2316 + 0.1 (1.3268) = 1.2432
0.2	1.4432	—	1.2432 + 0.1 (1.4432) = 1.3875
0.3	.3 + 1.3875	$\frac{1}{2}(1.4432 + 1.6875)$	1.3875 + 0.1 (1.5654) = 1.3997
0.3	.3 + 1.3997	$\frac{1}{2}(1.4432 + 1.6997)$	1.3997 + 0.1 (1.5715) = 1.4003
0.3	.3 + 1.4003	$\frac{1}{2}(1.4432 + 1.7003)$	1.4003 + 0.1 (1.5718) = 1.4004
0.3	.3 + 1.4004	$\frac{1}{2}(1.4432 + 1.7004)$	1.4004 + 0.1 (1.5718) = 1.4004

Hence $y(0.3) = 1.4004$ approximately.

Obs. In example 32.6, the approximate value of y for $x = 0.3$ would be 1.53 whereas by modified Euler's method the corresponding value is 1.4004 which is nearer its true value 1.3997, obtained from its exact solution $y = 2e^x - x - 1$ by putting $x = 0.3$.

Example 32.9. Using modified Euler's method, find $y(0.2)$ and $y(0.4)$ given

$$y' = y + e^x, y(0) = 0.$$

(J.N.T.U., 2009)

Solution. We have $y' = y + e^x = f(x, y)$; $x = 0, y = 0$ and $h = 0.2$

The various calculations are arranged as under :

To calculate $y(0.2)$:

x	$y + e^x = y'$	Mean slope	$Old\ y + h \text{ (mean slope)} = new\ y$
0.0	1	—	$0 + 0.2(1) = 0.2$
0.2	$0.2 + e^{0.2} = 1.4214$	$\frac{1}{2}(1 + 1.4214) = 1.2107$	$0 + 0.2(1.2107) = 0.2421$
0.2	$0.2421 + e^{0.2} = 1.4635$	$\frac{1}{2}(1 + 1.4635) = 1.2317$	$0 + 0.2(1.2317) = 0.2463$
0.2	$0.2463 + e^{0.2} = 1.4677$	$\frac{1}{2}(1 + 1.4677) = 1.2338$	$0 + 0.2(1.2338) = 0.2468$
0.2	$0.2468 + e^{0.2} = 1.4682$	$\frac{1}{2}(1 + 1.4682) = 1.2341$	$0 + 0.2(1.2341) = 0.2468$

Since the last two values of y are equal, we take $y(0.2) = 0.2468$.

To calculate $y(0.4)$.

x	$y + e^x = y'$	Mean slope	$Old\ y + h \text{ (Mean slope)} = new\ y$
0.2	$0.2468 + e^{0.2} = 1.4682$	—	$0.2468 + 0.2(1.4682) = 0.5404$
0.4	$0.5404 + e^{0.4} = 2.0322$	$\frac{1}{2}(1.4682 + 2.0322) = 1.7502$	$0.2468 + 0.2(1.7502) = 0.5968$
0.4	$0.5968 + e^{0.4} = 2.0887$	$\frac{1}{2}(1.4682 + 2.0887) = 1.7784$	$0.2468 + 0.2(1.7784) = 0.6025$
0.4	$0.6025 + e^{0.4} = 2.0943$	$\frac{1}{2}(1.4682 + 2.0943) = 1.78125$	$0.2468 + 0.2(1.78125) = 0.6030$
0.4	$0.6030 + e^{0.4} = 2.0949$	$\frac{1}{2}(1.4682 + 2.0949) = 1.7815$	$0.2468 + 0.2(1.7815) = 0.6031$
0.4	$0.6031 + e^{0.4} = 2.0949$	$\frac{1}{2}(1.4682 + 2.0949) = 1.7816$	$0.2468 + 0.2(1.7816) = 0.6031$

Since the last two value of y are equal, we take $y(0.4) = 0.6031$.

Hence $y(0.2) = 0.2468$ and $y(0.4) = 0.6031$ approximately.

Example 32.10. Solve the following by Euler's modified method :

$$\frac{dy}{dx} = \log(x+y), y(0) = 2.$$

at $x = 1.2$ and 1.4 with $h = 0.2$.

(Bhopal, 2009 ; U.P.T.U., 2007)

Solution. The various calculations are arranged as follows :

x	$\log(x+y) = y'$	Mean slope	$Old\ y + 0.2 \text{ (mean slope)} = new\ y$
0.0	$\log(0+2)$	—	$2 + 0.2(0.301) = 2.0602$
0.2	$\log(0.2 + 2.0602)$	$\frac{1}{2}(0.301 + 0.3541)$	$2 + 0.2(0.3276) = 2.0655$
0.2	$\log(0.2 + 2.0655)$	$\frac{1}{2}(0.301 + 0.3552)$	$2 + 0.2(0.3281) = 2.0656$
0.2	0.3552	—	$2.0656 + 0.2(0.3552) = 2.1366$
0.4	$\log(0.4 + 2.1366)$	$\frac{1}{2}(0.3552 + 0.4042)$	$2.0656 + 0.2(0.3797) = 2.1415$
0.4	$\log(0.4 + 2.1415)$	$\frac{1}{2}(0.3552 + 0.4051)$	$2.0656 + 0.2(0.3801) = 2.1416$

x	$\log(x+y) = y'$	Mean slope	$Old\ y + 0.2\ (mean\ slope) = new\ y$
0.4	0.4051	—	$2.1416 + 0.2(0.4051) = 2.2226$
0.6	$\log(0.6 + 2.2226)$	$\frac{1}{2}(0.4051 + 0.4506)$	$2.1416 + 0.2(0.4279) = 2.2272$
0.6	$\log(0.6 + 2.2272)$	$\frac{1}{2}(0.4051 + 0.4514)$	$2.1416 + 0.2(0.4282) = 2.2272$
0.6	0.4514	—	$2.2272 + 0.2(0.4514) = 2.3175$
0.8	$\log(0.8 + 2.3175)$	$\frac{1}{2}(0.4514 + 0.4938)$	$2.2272 + 0.2(0.4726) = 2.3217$
0.8	$\log(0.8 + 2.3217)$	$\frac{1}{2}(0.4514 + 0.4943)$	$2.2272 + 0.2(0.4727) = 2.3217$
0.8	0.4943	—	$2.3217 + 0.2(0.4943) = 2.4206$
1.0	$\log(1 + 2.4206)$	$\frac{1}{2}(0.4943 + 0.5341)$	$2.3217 + 0.2(0.5142) = 2.4245$
1.0	$\log(1 + 2.4245)$	$\frac{1}{2}(0.4943 + 0.5346)$	$2.3217 + 0.2(0.5144) = 2.4245$
1.0	0.5346	—	$2.4245 + 0.2(0.5346) = 2.5314$
1.2	$\log(1.2 + 2.5314)$	$\frac{1}{2}(0.5346 + 0.5719)$	$2.4245 + 0.2(0.5532) = 2.5351$
1.2	$\log(1.2 + 2.5351)$	$\frac{1}{2}(0.5346 + 0.5723)$	$2.4245 + 0.2(0.5534) = 2.5351$
1.2	0.5723	—	$2.5351 + 0.2(0.5723) = 2.6496$
1.4	$\log(1.4 + 2.6496)$	$\frac{1}{2}(0.5723 + 0.6074)$	$2.5351 + 0.2(0.5898) = 2.6531$
1.4	$\log(1.4 + 2.6531)$	$\frac{1}{2}(0.5723 + 0.6078)$	$2.5351 + 0.2(0.5900) = 2.6531$

Hence $y(1.2) = 2.5351$ and $y(1.4) = 2.6531$ approximately.

Example 32.11. Using Euler's modified method, obtain a solution of the equation $dy/dx = x + |\sqrt{y}|$, with initial conditions $y = 1$ at $x = 0$, for the range $0 \leq x \leq 0.6$ in steps of 0.2. (V.T.U., 2007)

Solution. The various calculations are arranged as follows :

x	$x + \sqrt{y} = y'$	Mean slope	$Old\ y + 0.2\ (mean\ slope) = new\ y$
0.0	$0 + 1 = 1$	—	$1 + 0.2(1) = 1.2$
0.2	$0.2 + \sqrt{1.2} = 1.2954$	$\frac{1}{2}(1 + 1.2954) = 1.1477$	$1 + 0.2(1.1477) = 1.2295$
0.2	$0.2 + \sqrt{1.2295} = 1.3088$	$\frac{1}{2}(1 + 1.3088) = 1.1544$	$1 + 0.2(1.1544) = 1.2309$
0.2	$0.2 + \sqrt{1.2309} = 1.3094$	$\frac{1}{2}(1 + 1.3094) = 1.1547$	$1 + 0.2(1.1547) = 1.2309$
0.2	1.3094	—	$1.2309 + 0.2(1.3094) = 1.4927$
0.4	$0.4 + \sqrt{1.4927} = 1.6218$	$\frac{1}{2}(1.3094 + 1.6218) = 1.4654$	$1.2309 + 0.2(1.4654) = 1.5240$
0.4	$0.4 + \sqrt{1.524} = 1.6345$	$\frac{1}{2}(1.3094 + 1.6345) = 1.4718$	$1.2309 + 0.2(1.4718) = 1.5253$
0.4	$0.4 + \sqrt{1.5253} = 1.6350$	$\frac{1}{2}(1.3094 + 1.6350) = 1.4721$	$1.2309 + 0.2(1.4721) = 1.5253$

x	$x + \sqrt{y'} = y'$	Mean slope	$Old\ y + .2\ (mean\ slope) = new\ y$
0.4	1.6350	—	$1.5253 + 0.2(1.635) = 1.8523$
0.6	$0.6 + \sqrt{1.8523} = 1.9610$	$\frac{1}{2}(1.635 + 1.961) = 1.798$	$1.5253 + 0.2(1.798) = 1.8849$
0.6	$0.6 + \sqrt{1.8849} = 1.9729$	$\frac{1}{2}(1.635 + 1.9729) = 1.8040$	$1.5253 + 0.2(1.804) = 1.8861$
0.6	$0.6 + \sqrt{1.8861} = 1.9734$	$\frac{1}{2}(1.635 + 1.9734) = 1.8042$	$1.5253 + 0.2(1.8042) = 1.8861$

Hence $y(0.6) = 1.8861$ approximately.

PROBLEMS 32.2

- Apply Euler's method to solve $y' = x + y$, $y(0) = 0$, choosing the step length = 0.2. (Carry out 6 steps). *(Kottayam, 2005)*
- Using simple Euler's method solve for y at $x = 0.1$ from $dy/dx = x + y + xy$, $y(0) = 1$, taking step size $h = 0.025$.
- Using Euler's method, find the approximate value of y when $dy/dx = x^2 + y^2$ and $y(0) = 1$ in five steps (i.e. $h = 0.2$). *(Mumbai, 2006)*
- Solve $y' = 1 - y$, $y(0) = 0$ by modified Euler's method and obtain y at $x = 0.1, 0.2, 0.3$. *(Anna, 2005)*
- Given $y' = x + \sin y$, $y(0) = 1$. Compute $y(0.2)$ and $y(0.4)$ with $h = 0.2$ using Euler's modified method. *(J.N.T.U., 2007)*
- Given that $dy/dx = x^2 + y$ and $y(0) = 1$. Find an approximate value of $y(0.1)$ taking $h = 0.05$ by modified Euler's method. *(V.T.U., 2010)*
- Given $\frac{dy}{dx} = \frac{y-x}{y+x}$ with boundary conditions $y = 1$ when $x = 0$, find approximately y for $x = 0.1$, by Euler's modified method (5 steps). *(V.T.U., 2007)*
- Given that $dy/dx = 2 + \sqrt{xy}$ and $y = 1$ when $x = 1$. Find approximate value of y at $x = 2$ in steps of 0.2, using Euler's modified method. *(Anna, 2004)*

32.6 RUNGE'S METHOD*

Consider the differential equation,

$$\frac{dy}{dx} = f(x, y), y(x_0) = y_0 \quad \dots(1)$$

Clearly the slope of the curve through $P(x_0, y_0)$ is $f(x_0, y_0)$ (Fig. 32.2).

Integrate both sides of (1) from (x_0, y_0) to $(x_0 + h, y_0 + k)$, we have

$$\int_{y_0}^{y_0+k} dy = \int_{x_0}^{x_0+h} f(x, y) dx \quad \dots(2)$$

To evaluate the integral on the right, we take N as the mid-point of LM and find the values of $f(x, y)$ (i.e. dy/dx) at the points $x_0, x_0 + h/2, x_0 + h$. For this purpose, we first determine the values of y at these points.

Let the ordinate through N cut the curve PQ in S and the tangent PT in S_1 . The value of y_s is given by the point S_1 .

$$\therefore y_s = NS = LP + HS_1 = y_0 + PH \tan \theta$$

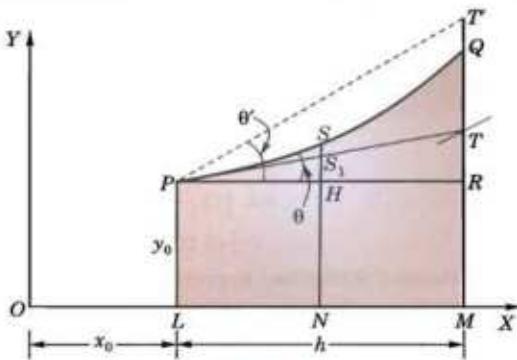

Fig. 32.2

* Called after the German mathematician Carl Runge (1856–1927) who was professor at Gottingen.

$$= y_0 + \frac{h}{2} (dy/dx)_P = y_0 + \frac{h}{2} f(x_0, y_0) \quad \dots(3)$$

Also $y_T = MT = LP + RT = y_0 + PR \tan \theta = y_0 + hf(x_0, y_0)$.

Now the value of y_Q at $x_0 + h$ is given by the point T' where the line through P drawn with slope at $T(x_0 + h, y_T)$ meets MQ .

\therefore Slope at $T = \tan \theta' = f(x_0 + h, y_T) = f[x_0 + h, y_0 + hf(x_0, y_0)]$

$$\therefore y_Q = MR + RT' = y_0 + PT \tan \theta' = y_0 + hf[x_0 + h, y_0 + hf(x_0, y_0)] \quad \dots(4)$$

Thus the value of $f(x, y)$ at $P = f(x_0, y_0)$,

the value of $f(x, y)$ at $S = f(x_0 + h/2, y_s)$

and the value of $f(x, y)$ at $Q = f(x_0 + h, y_Q)$

where y_S and y_Q are given by (3) and (4).

Hence from (2), we obtain

$$\begin{aligned} k &= \int_{x_0}^{x_0+h} f(x, y) dx = \frac{h}{6} [f_P + 4f_S + f_Q] && [\text{By Simpson's rule (p. 1106)}] \\ &= \frac{h}{6} [f(x_0, y_0) + 4f(x_0 + h/2, y_S) + f(x_0 + h, y_Q)] \end{aligned} \quad \dots(5)$$

which gives a sufficiently accurate value of k and also of $y = y_0 + k$.

The repeated application of (5) gives the values of y for equispaced points.

Working rule to solve (1) by Runge's method :

Calculate successively

$$k_1 = hf(x_0, y_0)$$

$$k_2 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1\right)$$

$$k' = hf(x_0 + h, y_0 + k_1)$$

$$k_3 = hf(x_0 + h, y_0 + k')$$

and

$$\text{Finally compute, } k = \frac{1}{6}(k_1 + 4k_2 + k_3).$$

(Note that k is the weighted mean of k_1 , k_2 and k_3)

Example 32.12. Apply Runge's method to find an approximate value of y when $x = 0.2$, given that $dy/dx = x + y$ and $y = 1$ when $x = 0$.

Solution. Here we have $x_0 = 0$, $y_0 = 1$, $h = 0.2$, $f(x_0, y_0) = 1$

$$\therefore k_1 = hf(x_0, y_0) = 0.2(1) = 0.200$$

$$k_2 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1\right) = 0.2f(0.1, 1.1) = 0.240$$

$$k' = hf(x_0 + h, y_0 + k_1) = 0.2f(0.2, 1.2) = 0.280$$

$$\text{and } k_3 = hf(x_0 + h, y_0 + k') = 0.2f(0.1, 1.28) = 0.296$$

$$\begin{aligned} \therefore k &= \frac{1}{6}(k_1 + 4k_2 + k_3) \\ &= \frac{1}{6}(0.200 + 0.960 + 0.296) = 0.2426 \end{aligned}$$

Hence the required approximate value of y is 1.2426.

32.7 RUNGE-KUTTA METHOD*

The Taylor's series method of solving differential equations numerically is restricted by the labour involved in finding the higher order derivatives. However there is a class of methods known as Runge-Kutta methods which do not require the calculations of higher order derivatives. These methods agree with Taylor's series solution upto the terms in h^r , where r differs from method to method and is called the *order of that method*. Euler's method, Modified Euler's method and Runge's method are the Runge-Kutta methods of the first, second and third order respectively.

* See footnote p. 1017. Named after Wilhelm Kutta (1867—1944).

The fourth-order Runge-Kutta method is most commonly used and is often referred to as 'Runge-Kutta method' only.

Working rule for finding the increment k of y corresponding to an increment h of x by Runge-Kutta method from

$$\frac{dy}{dx} = f(x, y), y(x_0) = y_0 \text{ is as follows :}$$

Calculate successively

$$k_1 = hf(x_0, y_0)$$

$$k_2 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1\right)$$

$$k_3 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2\right)$$

$$k_4 = hf(x_0 + h, y_0 + k_3)$$

and

$$k = \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4)$$

Finally compute

which gives the required approximate value $y_1 = y_0 + k$.

(Note that k is the weighted mean of k_1, k_2, k_3 and k_4)

Obs. One of the advantages of these methods is that the operation is identical whether the differential equation is linear or non-linear.

Example 32.13. Apply Runge-Kutta fourth order method, to find an approximate value of y when $x = 0.2$, given that $dy/dx = x + y$ and $y = 1$ when $x = 0$. (V.T.U., 2009 ; P.T.U., 2007 ; S.V.T.U., 2007)

Solution. Here

$$x_0 = 0, y_0 = 1, h = 0.2, f(x_0, y_0) = 1$$

$$\therefore k_1 = hf(x_0, y_0) = 0.2 \times 1 = 0.2000$$

$$k_2 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1\right) = 0.2 \times f(0.1, 1.1) = 0.2400$$

$$k_3 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2\right) = 0.2 \times f(0.1, 1.12) = 0.2440$$

$$k_4 = hf(x_0 + h, y_0 + k_3) = 0.2 \times f(0.2, 1.244) = 0.2888$$

and

$$\begin{aligned} \therefore k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \\ &= \frac{1}{6}(0.2000 + 0.4800 + 0.4880 + 0.2888) = \frac{1}{6} \times (1.4568) = 0.2468. \end{aligned}$$

Hence the required approximate value of y is 1.2428.

Example 32.14. Using Runge-Kutta method of fourth order, solve $\frac{dy}{dx} = \frac{y^2 - x^2}{y^2 + x^2}$ with $y(0) = 1$ at $x = 0.2$, 0.4. (U.P.T.U., 2010 ; J.N.T.U., 2009 ; V.T.U., 2008)

Solution. We have $f(x, y) = \frac{y^2 - x^2}{y^2 + x^2}$

To find $y(0.2)$:

Here $x_0 = 0, y_0 = 1, h = 0.2$

$$k_1 = h f(x_0, y_0) = 0.2 f(0, 1) = 0.2000$$

$$k_2 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1\right) = 0.2 f(0.1, 1.1) = 0.19672$$

$$k_3 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2\right) = 0.2 f(0.1, 1.09836) = 0.1967$$

$$k_4 = hf(x_0 + h, y_0 + k_3) = 0.2 f(0.2, 1.1967) = 0.1891$$

$$\begin{aligned} k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) = \frac{1}{6}[0.2 + 2(0.19672) + 2(0.1967) + 0.1891] \\ &= 0.19599 \end{aligned}$$

Hence

$$y(0.2) = y_0 + k = 1.196.$$

To find $y(0.4)$:

Here

$$\begin{aligned}x_1 &= 0.2, y_1 = 1.196, h = 0.2 \\k_1 &= h f(x_1, y_1) && = 0.1891 \\k_2 &= h f\left(x_1 + \frac{1}{2}h, y_1 + \frac{1}{2}k_1\right) = 0.2 f(0.3, 1.2906) && = 0.1795 \\k_3 &= h f\left(x_1 + \frac{1}{2}h, y_1 + \frac{1}{2}k_2\right) = 0.2 f(0.3, 1.2858) && = 0.1793 \\k_4 &= h f(x_1 + h, y_1 + k_3) = 0.2 f(0.4, 1.3753) && = 0.1688 \\k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \\&= \frac{1}{6}[0.1891 + 2(0.1795) + 2(0.1793) + 0.1688] && = 0.1792\end{aligned}$$

Hence

$$y(0.4) = y_1 + k = 1.196 + 0.1792 = 1.3752.$$

Example 32.15. Apply Runge-Kutta method to find an approximate value of y for $x = 0.2$ in steps of 0.1, if $dy/dx = x + y^2$, given that $y = 1$, where $x = 0$. (V.T.U., 2009; Osmania, 2007; Madras, 2000)

Solution. Here we take $h = 0.1$ and carry out the calculations in two steps.

Step I. $x_0 = 0, y_0 = 1, h = 0.1$

$$\begin{aligned}\therefore k_1 &= h f(x_0, y_0) = 0.1 f(0, 1) && = 0.1000 \\k_2 &= h f\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1\right) = 0.1 f(0.05, 1.1) && = 0.1152 \\k_3 &= h f\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2\right) = 0.1 f(0.05, 1.1152) && = 0.1168 \\k_4 &= h f(x_0 + h, y_0 + k_3) = 0.1 f(0.1, 1.1168) && = 0.1347 \\k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \\&= \frac{1}{6}(0.1000 + 0.2304 + 0.2336 + 0.1347) && = 0.1165\end{aligned}$$

giving

$$y(0.1) = y_0 + k = 1.1165.$$

Step II. $x_1 = x_0 + h = 0.1, y_1 = 1.1165, h = 0.1$

$$\begin{aligned}\therefore k_1 &= h f(x_1, y_1) = 0.1 f(0.1, 1.1165) && = 0.1347 \\k_2 &= h f\left(x_1 + \frac{1}{2}h, y_1 + \frac{1}{2}k_1\right) = 0.1 f(0.15, 1.1838) && = 0.1551 \\k_3 &= h f\left(x_1 + \frac{1}{2}h, y_1 + \frac{1}{2}k_2\right) = 0.1 f(0.15, 1.194) && = 0.1576 \\k_4 &= h f(x_1 + h, y_1 + k_3) = 0.1 f(0.2, 1.1576) && = 0.1823 \\k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) && = 0.1571\end{aligned}$$

Hence

$$y(0.2) = y_1 + k = 1.2736.$$

Example 32.16. Using Runge-Kutta method of fourth order, solve for y at $x = 1.2, 1.4$ from $\frac{dy}{dx} = \frac{2xy + e^x}{x^2 + xe^x}$ given $x_0 = 1, y_0 = 0$. (Mumbai, 2008)

Solution. We have $f(x, y) = \frac{2xy + e^x}{x^2 + xe^x}$

To find $y(1.2)$:

Here

$$x_0 = 1, y_0 = 0, h = 0.2$$

$$\therefore k_1 = h f(x_0, y_0) = 0.2 \frac{0+e}{1+e} = 0.1462$$

$$k_2 = h f\left(x_0 + \frac{h}{2}, y_0 + \frac{k_1}{2}\right) = 0.2 \left\{ \frac{2(1+0.1)(0+0.073)+e^{1+0.1}}{(1+0.1)^2+(1+0.1)e^{1+0.1}} \right\} = 0.1402$$

$$k_3 = hf\left(x_0 + \frac{h}{2}, y_0 + \frac{k_2}{2}\right) = 0.2 \left\{ \frac{2(1+0.1)(0+0.07) + e^{1.1}}{(1+0.1)^2 + (1+0.1)e^{1.1}} \right\} = 0.1399$$

$$k_4 = hf(x_0 + h, y_0 + k_3) = 0.2 \left\{ \frac{2(1.2)(0.1399) + e^{1.2}}{(1.2)^2 + (1.2)e^{1.2}} \right\} = 0.1348$$

and $k = \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) = \frac{1}{6}[0.1462 + 0.2804 + 0.2798 + 0.1348]$
 $= 0.1402.$

Hence $y(1.2) = y_0 + k = 0 + 0.1402 = 0.1402.$

To find $y(1.4) :$

Here $x_1 = 1.2, y_1 = 0.1402, h = 0.2$

$$k_1 = hf(x_1, y_1) = 0.2 f(1.2, 0) = 0.1348$$

$$k_2 = hf(x_1 + h/2, y_1 + k_1/2) = 0.2 f(1.3, 0.2076) = 0.1303$$

$$k_3 = hf(x_1 + h/2, y_1 + k_1/2) = 0.2 f(1.3, 0.2053) = 0.1301$$

$$k_4 = hf(x_1 + h, y_1 + k_3) = 0.2 f(1.3, 0.2703) = 0.1260$$

$$\therefore k = \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) = \frac{1}{6}[0.1348 + 0.2606 + 0.2602 + 0.1260] = 0.1303$$

Hence $y(1.4) = y_1 + k = 0.1402 + 0.1303 = 0.2705.$

PROBLEMS 32.3

1. Use Runge's method to approximate y when $x = 1.1$, given that $y = 1.2$ when $x = 1$ and $dy/dx = 3x + y^2$.
2. Using Runge-Kutta method of order 4, find $y(0.2)$ given that $dy/dx = 3x + \frac{1}{2}y, y(0) = 1$, taking $h = 0.1$.
(V.T.U., 2004)
3. Using Runge-Kutta method of order 4, compute $y(.2)$ and $(.4)$ from $10 \frac{dy}{dx} = x^2 + y^2, y(0) = 1$, taking $h = 0.1$.
(Rohtak, 2003 ; Bhopal, 2002)
4. Use Runge-Kutta method to find y when $x = 1.2$ in steps of 0.1, given that:
 $dy/dx = x^2 + y^2$ and $y(1) = 1.5$.
(Mumbai, 2007)
5. Find $y(0.1)$ and $y(0.2)$ using Runge-Kutta 4th order formula, given that $y' = x^2 - y$ and $y(0) = 1$.
(J.N.T.U., 2006)
6. Using 4th order Runge-Kutta method, solve the following equation, taking each step of $h = 0.1$, given $y(0) = 3, dy/dx = (4x/y - xy)$. Calculate y for $x = 0.1$ and 0.2 .
(Anna, 2007)
7. Use fourth order Runge-Kutta method to find y at $x = 0.1$, given that $\frac{dy}{dx} = 3e^x + 2y, y(0) = 0$ and $h = 0.1$.
(V.T.U., 2006)
8. Find by Runge-Kutta method an approximate value of y for $x = 0.8$, given that $y = 0.41$ when $x = 0.4$ and $dy/dx = \sqrt{x+y}$.
(S.V.T.U., 2007 S)
9. Using Runge-Kutta method of order 4, find $y(0.2)$ for the equation $\frac{dy}{dx} = \frac{y-x}{y+x}, y(0) = 1$. Take $h = 0.2$.
(V.T.U., 2011 S)
10. Given that $dy/dx = (y^2 - 2x)/(y^2 + x)$ and $y = 1$ at $x = 0$; find y for $x = 0.1, 0.2, 0.3, 0.4$ and 0.5 .
(Delhi, 2002)

32.8 PREDICTOR-CORRECTOR METHODS

If x_{i-1} and x_i be two consecutive mesh points, we have $x_i = x_{i-1} + h$. In the Euler's method (§ 32.4), we have

$$y_i = y_{i-1} + hf(x_0 + i-1 h, y_{i-1}) ; i = 1, 2, 3, \dots \quad \dots(1)$$

The modified Euler's method (§ 32.5), gives

$$y_i = y_{i-1} + \frac{h}{2} [f(x_{i-1}, y_{i-1}) + f(x_i, y_i)] \quad \dots(2)$$

The value of y_i is first estimated by using (1), then this value is inserted on the right side of (2), giving a better approximation of y_i . This value of y_i is again substituted in (2) to find a still better approximation of y_i . This step is repeated till two consecutive values of y_i agree. *This technique of refining an initially crude estimate of y_i by means of a more accurate formula is known as predictor-corrector method.* The equation (1) is therefore called the *predictor* while (2) serves as a *corrector* of y_i .

In the methods so far explained, to solve a differential equation over an interval (x_i, x_{i+1}) only the value of y at the beginning of the interval was required. In the *predictor-corrector* methods, four prior values are required for finding the value of y at x_{i+1} . A predictor formula is used to predict the value of y at x_{i+1} and then a corrector formula is applied to improve this value.

We now describe two such methods, namely : Milne's method and Adams-Bashforth method.

32.9 | MILNE'S METHOD

Given $dy/dx = f(x, y)$ and $y = y_0, x = x_0$; to find an approximate value of y for $x = x_0 + nh$ by Milne's method, we proceed as follows :

The value $y_0 = y(x_0)$ being given, we compute

$$y_1 = y(x_0 + h), y_2 = y(x_0 + 2h), y_3 = y(x_0 + 3h),$$

by Picard's or Taylor's series method.

Next we calculate,

$$f_0 = f(x_0, y_0), f_1 = f(x_0 + h, y_1), f_2 = f(x_0 + 2h, y_2), f_3 = f(x_0 + 3h, y_3)$$

Then to find $y_4 = y(x_0 + 4h)$, we substitute Newton's forward interpolation formula

$$f(x, y) = f_0 + n\Delta f_0 + \frac{n(n-1)}{2} \Delta^2 f_0 + \frac{n(n-1)(n-2)}{6} \Delta^3 f_0 + \dots$$

in the relation $y_4 = y_0 + \int_{x_0}^{x_0 + 4h} f(x, y) dx$

$$\begin{aligned} y_4 &= y_0 + \int_{x_0}^{x_0 + 4h} \left(f_0 + n\Delta f_0 + \frac{n(n-1)}{2} \Delta^2 f_0 + \dots \right) dx && [\text{Put } x = x_0 + nh, dx = hn] \\ &= y_0 + h \int_0^4 \left(f_0 + n\Delta f_0 + \frac{n(n-1)}{2} \Delta^2 f_0 + \dots \right) dn \\ &= y_0 + h \left(4f_0 + 8\Delta f_0 + \frac{20}{3} \Delta^2 f_0 + \frac{8}{3} \Delta^3 f_0 + \dots \right) \end{aligned}$$

Neglecting fourth and higher order differences and expressing Δf_0 , $\Delta^2 f_0$ and $\Delta^3 f_0$ in terms of the function values, we get

$$y_4^{(p)} = y_0 + \frac{4h}{3} (2f_1 - f_2 + 2f_3) \text{ which is called a } \textit{predictor}.$$

Having found y_4 , we obtain a first approximation to $f_4 = f(x_0 + 4h, y_4)$.

Then a better value of y_4 is found by Simpson's rule (p. 1106) as

$$y_4^{(r)} = y_2 + \frac{h}{3} (f_2 + 4f_3 + f_4) \text{ which is called a } \textit{corrector}.$$

Then an improved value of f_4 is computed and again the corrector is applied to find a still better value of y_4 . We repeat this step until y_4 remains unchanged.

Once y_4 and f_4 are obtained to desired degree of accuracy, $y_5 = y(x_0 + 5h)$ is found from the predictor as

$$y_5^{(p)} = y_1 + \frac{4h}{3} (2f_2 - f_3 + 2f_4)$$

and $f_5 = f(x_0 + 5h, y_5)$ is calculated. Then a better approximation to the value of y_5 is obtained from the corrector as

$$y_5^{(c)} = y_3 + \frac{h}{3} (f_3 + 4f_4 + f_5).$$

We repeat this step till y_5 becomes stationary and we, then proceed to calculate y_6 as before.

This is Milne's predictor-corrector method. To ensure greater accuracy, we must first improve the accuracy of the starting values and then sub-divide the intervals.

Example 32.17. Apply Milne's method, to find a solution of the differential equation $y' = x - y^2$ in the range $0 \leq x \leq 1$ for the boundary conditions $y = 0$ at $x = 0$. (V.T.U., 2009, Anna, 2005, Rohtak, 2005)

Solution. Using Picard's method, we have

$$y = y(0) + \int_0^x f(x, y) dx, \text{ where } f(x, y) = x - y^2.$$

To get the first approximation, we put $y = 0$ in $f(x, y)$,

giving $y_1 = 0 + \int_0^x x dx = \frac{x^2}{2}$

To find the second approximation, we put $y = x^2/2$ in $f(x, y)$,

giving $y_2 = \int_0^x \left(x - \frac{x^4}{4} \right) dx = \frac{x^2}{2} - \frac{x^5}{20}$

Similarly, the third approximation is

$$y_3 = \int_0^x \left[x - \left(\frac{x^2}{2} - \frac{x^5}{20} \right)^2 \right] dx = \frac{x^2}{2} - \frac{x^5}{20} + \frac{x^8}{160} - \frac{x^{11}}{4400} \quad \dots(i)$$

Now let us determine the starting values of the Milne's method from (i), by choosing $h = 0.2$.

$$\begin{array}{lll} \therefore x_0 = 0.0, & y_0 = 0.0000, & f_0 = 0.0000 \\ x_1 = 0.2, & y_1 = 0.020, & f_1 = 0.1996 \\ x_2 = 0.4, & y_2 = 0.0795, & f_2 = 0.3937 \\ x_3 = 0.6, & y_3 = 0.1762, & f_3 = 0.5689 \end{array}$$

Using the predictor, $y_4^{(p)} = y_0 + \frac{4h}{3} (2f_1 - f_2 + 2f_3)$

$$x = 0.8, \quad y_4^{(p)} = 0.3049, \quad f_4 = 0.7070$$

and the corrector, $y_4^{(c)} = y_2 + \frac{h}{3} (f_2 + 4f_3 + f_4)$, yields

$$y_4^{(c)} = 0.3046, \quad f_4 = 0.7072 \quad \dots(ii)$$

Again using the corrector, $y_4^{(c)} = 0.3046$, which is same as in (ii)

Now using the predictor, $y_5^{(p)} = y_1 + \frac{4h}{3} (2f_2 - f_3 + 2f_4)$,

$$x = 1.0, \quad y_5^{(p)} = 0.4554, \quad f_5 = 0.7926$$

and the corrector, $y_5^{(c)} = y_3 + \frac{h}{3} (f_3 + 4f_4 + f_5)$, gives

$$y_5^{(c)} = 0.4555, \quad f_5 = 0.7925$$

Again using the corrector,

$$y_5^{(c)} = 0.4555, \text{ a value which is the same as before.}$$

Hence, $y(1) = 0.4555$.

Example 32.18. Given $y' = x(x^2 + y^2) e^{-x}$, $y(0) = 1$, find y at $x = 0.1, 0.2$ and 0.3 by Taylor's series method and compute $y(0.4)$ by Milne's method. (Anna, 2007)

Solution. Given

We have

$$y(0) = 1 \quad \text{and} \quad h = 0.1$$

$$y'(x) = x(x^2 + y^2) e^{-x};$$

$$\begin{aligned} y''(x) &= [(x^3 + xy^2)(-e^{-x}) + 3x^2 + y^2 + x(2y)y']e^{-x} \\ &= e^{-x}[-x^3 - xy^2 + 3x^2 + y^2 + 2xyy']; \end{aligned}$$

$$y'(0) = 0$$

$$y''(0) = 1$$

$$y'''(0) = -2$$

Substitute these values in the Taylor's series,

$$y(x) = y(0) + \frac{x}{1!}y'(0) + \frac{x^2}{2!}y''(0) + \frac{x^3}{3!}y'''(0) + \dots$$

$$\begin{aligned} y(0.1) &= 1 + (0.1)(0) + \frac{1}{2}(0.1)^2(1) + \frac{1}{6}(0.1)^3(-2) + \dots \\ &= 1 + 0.005 - 0.0003 = 1.0047 \quad i.e., \quad 1.005 \end{aligned}$$

Now taking

$$x = 0.1, y(0.1) = 1.005, h = 0.1$$

$$y'(0.1) = 0.092, y''(0.1) = 0.849, y'''(0.1) = -1.247$$

Substituting these values in the Taylor's series about $x = 0.1$,

$$\begin{aligned} y(0.2) &= y(0.1) + \frac{0.1}{1!}y'(0.1) + \frac{(0.1)^2}{2!}y''(0.1) + \frac{(0.1)^3}{3!}y'''(0.1) + \dots \\ &= 1.005 + (0.1)(0.092) + \frac{(0.1)^2}{2}(0.849) + \frac{(0.1)^3}{3}(-1.247) + \dots \\ &= 1.018 \end{aligned}$$

Now taking

$$x = 0.2, y(0.2) = 1.018, h = 0.1$$

$$y'(0.2) = 0.176, y''(0.2) = 0.77, y'''(0.2) = 0.819$$

Substituting these values in the Taylor's series

$$\begin{aligned} y(0.3) &= y(0.2) + \frac{0.1}{1!}y''(0.2) + \frac{(0.1)^2}{2!}y''(0.2) + \frac{(0.1)^3}{3!}y'''(0.2) + \dots \\ &= 1.018 + 0.0176 + 0.0039 + 0.0001 = 1.04 \end{aligned}$$

Thus the starting values of the Milne's method with $h = 0.1$ are

$$x_0 = 0.0$$

$$y_0 = 1$$

$$f_0 = y'_0 = 0$$

$$x_1 = 0.1$$

$$y_1 = 1.005$$

$$f_1 = 0.092$$

$$x_2 = 0.2$$

$$y_2 = 1.018$$

$$f_2 = 0.176$$

$$x_3 = 0.3$$

$$y_3 = 1.04$$

$$f_3 = 0.26$$

$$\text{Using the predictor, } y_4^{(p)} = y_0 + \frac{4h}{3}(2f_1 - f_2 + 2f_3)$$

$$= 1 + \frac{4(0.1)}{3}[2(0.092) - (0.176) + 2(0.26)] = 1.09$$

$$\therefore x = 0.4 \quad y_4^{(p)} = 1.09 \quad f_4 = y'(0.4) = 0.362$$

$$\text{Using the corrector, } y_4^{(r)} = y_2 + \frac{h}{3}(f_2 + 4f_3 + f_4)$$

$$\therefore y_4^{(r)} = 0.018 + \frac{0.1}{3}(0.176 + 4(0.26) + 0.362) = 1.071$$

$$\text{Hence } y(0.4) = 1.071.$$

Example 32.19. Using Runge-Kutta method of order 4, find y for $x = 0.1, 0.2, 0.3$ given that $dy/dx = xy + y^2$, $y(0) = 1$. Continue the solution at $x = 0.4$ using Milne's method.

(V.T.U., 2008; S.V.T.U., 2007; Madras, 2006)

Solution. We have $f(x, y) = xy + y^2$.

To find $y(0.1)$:

Here $x_0 = 0, y_0 = 1, h = 0.1$.

$$\begin{aligned}
 \therefore k_1 &= h f(x_0, y_0) = (0.1) f(0.1) &= 0.1000 \\
 k_2 &= h f\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1\right) = (0.1) f(0.05, 1.05) &= 0.1155 \\
 k_3 &= h f\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2\right) = (0.1) f(0.05, 1.0577) &= 0.1172 \\
 k_4 &= h f(x_0 + h, y_0 + k_3) = (0.1) f(0.1, 1.1172) &= 0.13598 \\
 k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \\
 &= \frac{1}{6}(0.1 + 0.231 + 0.2348 + 0.13598) &= 0.11687
 \end{aligned}$$

Thus $y(0.1) = y_1 = y_0 + k = 1.1169$.

To find $y(0.2)$:

Here $x_1 = 0.1$, $y_1 = 1.1169$, $h = 0.1$.

$$\begin{aligned}
 k_1 &= h f(x_1, y_1) = (0.1) f(0.1, 1.1169) &= 0.1359 \\
 k_2 &= h f\left(x_1 + \frac{1}{2}h, y_1 + \frac{1}{2}k_1\right) = (0.1) f(0.15, 1.1848) &= 0.1581 \\
 k_3 &= h f\left(x_1 + \frac{1}{2}h, y_1 + \frac{1}{2}k_2\right) = (0.1) f(0.15, 1.1959) &= 0.1609 \\
 k_4 &= h f(x_1 + h, y_1 + k_3) = (0.1) f(0.2, 1.2778) &= 0.1888 \\
 k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) &= 0.1605
 \end{aligned}$$

Thus $y(0.2) = y_2 = y_1 + k = 1.2773$.

To find $y(0.3)$:

Here $x_2 = 0.2$, $y_2 = 1.2773$, $h = 0.1$.

$$\begin{aligned}
 k_1 &= h f(x_2, y_2) = (0.1) f(0.2, 1.2773) &= 0.1887 \\
 k_2 &= h f\left(x_2 + \frac{1}{2}h, y_2 + \frac{1}{2}k_1\right) = (0.1) f(0.25, 1.3716) &= 0.2224 \\
 k_3 &= h f\left(x_2 + \frac{1}{2}h, y_2 + \frac{1}{2}k_2\right) = (0.1) f(0.25, 1.3885) &= 0.2275 \\
 k_4 &= h f(x_2 + h, y_2 + k_3) = (0.1) f(0.3, 1.5048) &= 0.2716 \\
 k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) &= 0.2267
 \end{aligned}$$

Thus $y(0.3) = y_3 = y_2 + k = 1.504$.

Now the starting values of the Milne's method are :

$$\begin{array}{lll}
 x_0 = 0.0 & y_0 = 1.0000 & f_0 = 1.0000 \\
 x_1 = 0.1 & y_1 = 1.1169 & f_1 = 1.3591 \\
 x_2 = 0.2 & y_2 = 1.2773 & f_2 = 1.8869 \\
 x_3 = 0.3 & y_3 = 1.5049 & f_3 = 2.7132
 \end{array}$$

Using the predictor,

$$\begin{aligned}
 y_4^{(p)} &= y_0 + \frac{4h}{3}(2f_1 - f_2 + 2f_3) \\
 x_4 &= 0.4 & y_4^{(p)} &= 1.8344 & f_4 &= 4.0988
 \end{aligned}$$

and the corrector,

$$\begin{aligned}
 y_4^{(c)} &= y_2 + \frac{h}{3}(f_2 + 4f_3 + f_4) \text{ yields} \\
 y_4^{(c)} &= 1.2773 + \frac{0.1}{3}[1.8869 + 4(2.7132) + 4.0988] \\
 &= 1.8386 & f_4 &= 4.1159
 \end{aligned}$$

Again using the corrector,

$$\begin{aligned} y_4^{(c)} &= 1.2773 + \frac{0.1}{3} [1.8869 + 4(2.7132) + 4.1159] \\ &= 1.8391 \quad f_4 = 4.1182 \end{aligned} \quad \dots(i)$$

Again using the corrector

$$\begin{aligned} y_4^{(c)} &= 1.2773 + \frac{0.1}{3} [1.8869 + 4(2.7132) + 4.1182] \\ &= 1.8392 \text{ which is same as (i).} \end{aligned}$$

Hence $y(0.4) = 1.8392$.

PROBLEMS 32.4

- Given $\frac{dy}{dx} = x^2 + y$, $y(0) = 2$. The value of $y(0.2) = 2.073$, $y(0.4) = 2.452$, and $y(0.6) = 3.023$ are got by R.K. Method of 4th order. Find $y(0.8)$ by Milne's predictor-corrector method taking $h = 0.2$. (Anna, 2004)
- Given $2\frac{dy}{dx} = (1+x^2)y^2$ and $y(0) = 1$, $y(0.1) = 1.06$, $y(0.2) = 1.12$, $y(0.3) = 1.21$, evaluate $y(0.4)$ by Milne's predictor-corrector method. (V.T.U., 2011 S ; Madras, 2003)
- From the data given below, find y at $x = 1.4$, using Milne's predictor-corrector formula :

$$\frac{dy}{dx} = x^2 + \frac{y}{2}$$

$x :$	1	1.1	1.2	1.3
$y :$	2	2.2156	2.4549	2.7514

(V.T.U., 2007)

- Using Milne's method, find $y(4.5)$ given $5xy' + y^2 - 2 = 0$ given $y(4) = 1$, $y(4.1) = 1.0049$, $y(4.2) = 1.0097$, $y(4.3) = 1.0143$, $y(4.4) = 1.0187$. (Anna, 2007)
- If $\frac{dy}{dx} = 2e^x - y$, $y(0) = 2$, $y(0.1) = 2.010$, $y(0.2) = 2.04$ and $y(0.3) = 2.09$; find $y(0.4)$ using Milne's predictor-corrector method. (V.T.U., 2010)
- Using Runge-Kutta method, calculate $y(0.1)$, $y(0.2)$, and $y(0.3)$ given that $\frac{dy}{dx} - \frac{2xy}{1+x^2} = 1$, $y(0) = 0$. Taking these values as starting values, find $y(0.4)$ by Milne's method.

32.10 ADAMS-BASHFORTH METHOD

Given $\frac{dy}{dx} = f(x, y)$ and $y_0 = y(x_0)$, we compute

$$y_{-1} = y(x_0 - h), y_{-2} = y(x_0 - 2h), y_{-3} = y(x_0 - 3h)$$

by Taylor's series of Euler's method or Runge-Kutta method.

Next we calculate $f_{-1} = f(x_0 - h, y_{-1})$, $f_{-2} = f(x_0 - 2h, y_{-2})$, $f_{-3} = f(x_0 - 3h, y_{-3})$.

Then to find y_1 , we substitute Newton's backward interpolation formula

$$f(x, y) = f_0 + n \nabla f_0 + \frac{n(n+1)}{2} \nabla^2 f_0 + \frac{n(n+1)(n+2)}{6} \nabla^3 f_0 + \dots$$

in $y_1 = y_0 + \int_{x_0}^{x_0+h} f(x, y) dx$... (1)

$$\begin{aligned} \therefore y_1 &= y_0 + \int_{x_0}^{x_1} \left(f_0 + n \nabla f_0 + \frac{n(n+1)}{2} \nabla^2 f_0 + \dots \right) dx \quad [\text{Put } x = x_0 + nh, dx = hdn] \\ &= y_0 + h \int_0^1 \left(f_0 + n \nabla f_0 + \frac{n(n+1)}{2} \nabla^2 f_0 + \dots \right) dn \\ &= y_0 + h \left(f_0 + \frac{1}{2} \nabla f_0 + \frac{5}{12} \nabla^2 f_0 + \frac{3}{8} \nabla^3 f_0 + \dots \right) \end{aligned}$$

Neglecting fourth and higher order differences and expressing ∇f_0 , $\nabla^2 f_0$ and $\nabla^3 f_0$ in terms of function values, we get

$$y_1^{(p)} = y_0 + \frac{h}{24} (55f_0 - 59f_{-1} + 37f_{-2} - 9f_{-3}) \quad \dots(2)$$

This is called *Adams-Basforth predictor formula*.

Having found y_1 , we find $f_1 = f(x_0 + h, y_1)$.

Then to find a better value of y_1 , we derive a *corrector formula* by substituting Newton's backward formula at f_1 i.e.,

$$f(x, y) = f_1 + n\nabla f_1 + \frac{n(n+1)}{2} \nabla^2 f_1 + \frac{n(n+1)(n+2)}{6} \nabla^3 f_1 + \dots \text{ in (1).}$$

$$\begin{aligned} \therefore y_1 &= y_0 + \int_{x_0}^{x_1} \left(f_1 + n\nabla f_1 + \frac{n(n+1)}{2} \nabla^2 f_1 + \dots \right) dx \quad [\text{Put } x = x_1 + nh, dx = hdn] \\ &= y_0 + \int_{-1}^0 \left(f_1 + n\nabla f_1 + \frac{n(n+1)}{2} \nabla^2 f_1 + \dots \right) dn \\ &= y_0 + h \left(f_1 - \frac{1}{2} \nabla f_1 - \frac{1}{12} \nabla^2 f_1 - \frac{1}{24} \nabla^3 f_1 - \dots \right) \end{aligned}$$

Neglecting fourth and higher order differences and expressing ∇f_1 , $\nabla^2 f_1$ and $\nabla^3 f_1$ in terms of function values, we obtain

$$y_1^{(c)} = y_0 + \frac{h}{24} (9f_1 + 19f_0 - 5f_{-1} + f_{-2}) \quad \dots(3)$$

which is called a *Adams-Moulton corrector formula*.

Then an improved value of f_1 is calculated and again the corrector (3) is applied to find a still better value of y_1 . This step is repeated till y_1 remains unchanged and then proceed to calculate y_2 as above.

Obs. To apply both Milne and Adams-Basforth methods, we require four starting values of y which are calculated by means of Picard's method or Taylor's series method or Euler's method or Runge-Kutta method. In practice, the Adams formulae (2) and (3) above together with fourth order Runge-Kutta formulae have been found to be most useful.

Example 32.20. Given $\frac{dy}{dx} = x^2(1+y)$ and $y(1) = 1$, $y(1.1) = 1.233$, $y(1.2) = 1.548$, $y(1.3) = 1.979$, evaluate $y(1.4)$ by Adams-Basforth method. (V.T.U., 2010 ; J.N.T.U., 2009 ; Anna, 2004)

Solution. Here $f(x, y) = x^2(1+y)$.

Starting values of the Adams-Basforth method with $h = 0.1$, are

$$\begin{aligned} x &= 1.0, y_{-3} = 1.000, f_{-3} = (1.0)^2(1+1.000) = 2.000 \\ &= 1.1, y_{-2} = 1.233, f_{-2} = 2.702 \\ &= 1.2, y_{-1} = 1.548, f_{-1} = 3.669 \\ &= 1.3, y_0 = 1.979, f_0 = 5.035 \end{aligned}$$

Using th

$$\frac{h}{24} (55f_0 - 59f_{-1} + 37f_{-2} - 9f_{-3})$$

$$73, f_1 = 7.004$$

U:

$$-5f_{-1} + f_{-2})$$

$$19 \times 5.035 - 5 \times 3.669 + 2.702 = 2.575$$

Hence,

5.

Example 32.21. If $\frac{dy}{dx} = 2e^x y$, $y(0) = 0$, find $y(4)$ using Adams predictor-corrector formula by calculating $y(1)$, $y(2)$ and $y(3)$ using Euler's modified formula. (J.N.T.U., 2006)

Solution. We have $f(x, y) = 2e^x y$.

To find 0.1 :

x	$2e^x y = y'$	Mean slope	$Old\ y + h\ (Mean\ slope) = new\ y$
0.0	4	—	$2 + 0.1(4) = 2.4$
0.1	$2e^{0.1}(2.4) = 5.305$	$\frac{1}{2}(4 + 5.305) = 4.6524$	$2 + 0.1(4.6524) = 2.465$
0.1	$2e^{0.1}(2.465) = 5.449$	$\frac{1}{2}(4 + 5.449) = 4.7244$	$2 + 0.1(4.7244) = 2.472$
0.1	$2e^{0.1}(2.472) = 5.465$	$\frac{1}{2}(4 + 5.465) = 4.7324$	$2 + 0.1(4.7324) = 2.473$
0.1	$2e^{0.1}(2.473) = 5.467$	$\frac{1}{2}(4 + 5.467) = 4.7333$	$2 + 0.1(4.7333) = 2.473$
0.1	5.467	—	$2 + 0.1(5.467) = 3.0199$
0.2	$2e^{0.2}(3.0199) = 7.377$	$\frac{1}{2}(5.467 + 7.377) = 6.422$	$2.473 + 0.1(6.422) = 3.1155$
0.2	7.611	$\frac{1}{2}(5.467 + 7.611) = 6.539$	$2.473 + 0.1(6.539) = 3.127$
0.2	7.639	$\frac{1}{2}(5.467 + 7.639) = 6.553$	$2.473 + 0.1(6.553) = 3.129$
0.2	7.643	$\frac{1}{2}(5.467 + 7.643) = 6.555$	$2.473 + 0.1(6.455) = 3.129$
0.2	7.643	—	$3.129 + 0.1(7.643) = 3.893$
0.3	$2e^{0.3}(3.893) = 10.51$	$\frac{1}{2}(7.643 + 10.51) = 9.076$	$3.129 + 0.1(9.076) = 4.036$
0.3	10.897	$\frac{1}{2}(7.643 + 10.897) = 9.266$	$3.129 + 0.1(9.266) = 4.056$
0.3	10.949	$\frac{1}{2}(7.643 + 10.949) = 9.296$	$3.129 + 0.1(9.296) = 4.058$
0.3	10.956	$\frac{1}{2}(7.643 + 10.956) = 9.299$	$3.129 + 0.1(9.299) = 4.0586$

To find $y(0.4)$ by Adam's method, the starting values with $h = 0.1$ are

$$\begin{array}{lll} x = 0.0 & y_{-3} = 2.4 & f_{-3} = 4 \\ x = 0.1 & y_{-2} = 2.473 & f_{-2} = 5.467 \\ x = 0.2 & y_{-1} = 3.129 & f_{-1} = 7.643 \\ x = 0.3 & y_0 = 4.059 & f_0 = 10.956 \end{array}$$

Using the predictor formula

$$\begin{aligned} y_1^{(p)} &= y_0 + \frac{h}{24} (55f_0 - 59f_{-1} + 37f_{-2} - 9f_{-3}) \\ &= 4.059 + \frac{0.1}{24} (55 \times 10.957 - 59 \times 7.643 + 37 \times 5.467 - 9 \times 4) \\ &= 5.383 \end{aligned}$$

Now $x = 0.4$ $y_1 = 5.383$ $f_1 = 2e^{0.4}(5.383) = 16.061$

Using the corrector formula,

$$\begin{aligned} y_1^{(c)} &= y_0 + \frac{h}{24} (9f_1 + 19f_0 - 5f_{-1} + f_{-2}) \\ &= 4.0586 + \frac{0.1}{24} (9 \times 6.061 + 19 \times 10.956 - 5 \times 7.643 + 5.467) = 5.392 \end{aligned}$$

Hence $y(0.4) = 5.392$.

Example 32.22. Solve the initial value problem $dy/dx = x - y^2$, $y(0) = 1$ to find $y(0.4)$ by Adam's method. Starting solutions required are to be obtained using Runge-Kutta method of order 4 using step value $h = 0.1$. (P.T.U., 2003)

Solution. We have $f(x, y) = x - y^2$.

To find $y(0.1)$:

Here $x_0 = 0$, $y_0 = 1$, $h = 0.1$

$$\begin{aligned} k_1 &= hf(x_0, y_0) = (0.1)f(0, 1) &= -0.1000 \\ k_2 &= hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1\right) = (0.1)f(0.05, 0.95) &= -0.08525 \\ k_3 &= hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2\right) = (0.1)f(0.05, 0.9574) &= -0.0867 \\ k_4 &= hf(x_0 + h, y_0 + k_3) = (0.1)f(0.1, 0.9137) &= -0.07341 \\ k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) &= -0.0883 \end{aligned}$$

$$\text{Thus } y(0.1) = y_1 = y_0 + k = 1 - 0.0883 = 0.9117$$

To find $y(0.2)$:

Here $x_1 = 0.1$, $y_1 = 0.9117$, $h = 0.1$.

$$\begin{aligned} k_1 &= hf(x_1, y_1) = (0.1)f(0.1, 0.9117) &= -0.0731 \\ k_2 &= hf\left(x_1 + \frac{1}{2}h, y_1 + \frac{1}{2}k_1\right) = (0.1)f(0.15, 0.8751) &= -0.0616 \\ k_3 &= hf\left(x_1 + \frac{1}{2}h, y_1 + \frac{1}{2}k_2\right) = (0.1)f(0.15, 0.8809) &= -0.0626 \\ k_4 &= hf(x_1 + h, y_1 + k_3) = (0.1)f(0.2, 0.8491) &= -0.0521 \\ k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) &= -0.0623 \end{aligned}$$

$$\text{Thus } y(0.2) = y_2 = y_1 + k = 0.8494.$$

To find $y(0.3)$:

Here $x_2 = 0.2$, $y_2 = 0.8494$, $y = 0.1$

$$\begin{aligned} k_1 &= hf(x_2, y_2) = (0.1)f(0.2, 0.8494) &= -0.0521 \\ k_2 &= hf\left(x_2 + \frac{1}{2}h, y_2 + \frac{1}{2}k_1\right) = (0.1)f(0.25, 0.8233) &= -0.0428 \\ k_3 &= hf\left(x_2 + \frac{1}{2}h, y_2 + \frac{1}{2}k_2\right) = (0.1)f(0.25, 0.828) &= -0.0436 \\ k_4 &= hf(x_2 + h, y_2 + k_3) = (0.1)f(0.3, 0.8058) &= -0.0349 \\ k &= \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) &= -0.0438 \end{aligned}$$

$$\text{Thus } y(0.3) = y_3 = y_2 + k = 0.8061$$

Now the starting values of Adam's method with $h = 0.1$ are :

$x = 0.0$	$y_{-3} = 1.0000$	$f_{-3} = 0.0 - (1.0)^2$	$= -1.0000$
$x = 0.1$	$y_{-2} = 0.9117$	$f_{-2} = 0.1 - (0.9117)^2$	$= -1.7312$
$x = 0.2$	$y_{-1} = 0.8494$	$f_{-1} = 0.2 - (0.8494)^2$	$= -0.5215$
$x = 0.3$	$y_0 = 0.8061$	$f_0 = 0.3 - (0.8061)^2$	$= -0.3498$

Using the predictor,

$$\begin{aligned}y_1^{(p)} &= y_0 + \frac{h}{24} (55f_0 - 59f_{-1} + 37f_{-2} - 9f_{-3}) \\x = 0.4 &\quad y_1^{(p)} = 0.8061 + \frac{0.1}{24} [55(-0.3498) - 59(-0.5215) + 37(-0.7312) - 9(-1)] \\&= 0.7789 \quad f_1 = -0.2067\end{aligned}$$

Using the corrector,

$$\begin{aligned}y_1^{(c)} &= y_0 + \frac{h}{24} (9f_1 + 19f_0 - 5f_{-1} + f_{-2}) \\y_1^{(c)} &= 0.8061 + \frac{0.1}{24} [9(-0.2067) + 19(-0.3498) - 5(-0.5215) - 0.7312] = 0.7785 \\ \text{Hence } y(0.4) &= 0.7785.\end{aligned}$$

PROBLEMS 32.5

1. Using Adams-Basforth method, obtain the solution of $dy/dx = x - y^2$ at $x = 0.8$, given the values

$x :$	0	0.2	0.4	0.6
$y :$	0	0.0200	0.0795	0.1762

(Bhopal, 2002)

2. Using Adams-Basforth formulae, determine $y(0.4)$ given the differential equation $dy/dx = \frac{1}{2}xy$ and the data

$x :$	0	0.1	0.2	0.3
$y :$	1	1.0025	1.0101	1.0228

3. Given $y' = x^2 - y$, $y(0) = 1$ and the starting values $y(0.1) = 0.90516$, $y(0.2) = 0.82127$, $y(0.3) = 0.74918$, evaluate $y(0.4)$ using Adams-Basforth method. (S.V.T.U., 2007)

4. Using Adams-Basforth method, find $y(4.4)$ given $5xy' + y^2 = 2$, $y(4) = 1$, $y(4, 1) = 1.0049$, $y(4, 2) = 1.0097$ and $y(4, 3) = 1.0143$.

5. Given the differential equation $dy/dx = x^2y + x^2$ and the data :

$x :$	1	1.1	1.2	1.3
$y :$	1	1.233	1.548488	1.978921

(Indore, 2003 S)

6. Using Adams-Basforth method, evaluate $y(1.4)$, if y satisfies $dy/dx + y/x = 1/x^2$ and $y(1) = 1$, $y(1.1) = 0.996$, $y(1.2) = 0.986$, $y(1.3) = 0.972$. (Madras, 2003)

32.11 SIMULTANEOUS FIRST ORDER DIFFERENTIAL EQUATIONS

The simultaneous differential equations of the type

$$\frac{dy}{dx} = f(x, y, z) \quad \dots(1)$$

$$\text{and} \quad \frac{dz}{dx} = \phi(x, y, z) \quad \dots(2)$$

with initial conditions $y(x_0) = y_0$ and $z(x_0) = z_0$ can be solved by the methods discussed in the preceding sections, especially by Picard's or Runge-Kutta methods.

(i) *Picard's method* gives

$$y_1 = y_0 + \int f(x, y_0, z_0) dx, z_1 = z_0 + \int \phi(x, y_0, z_0) dx$$

$$y_2 = y_0 + \int f(x, y_1, z_1) dx, z_2 = z_0 + \int \phi(x, y_1, z_1) dx$$

$$y_3 = y_0 + \int f(x, y_2, z_2) dx, z_3 = z_0 + \int \phi(x, y_2, z_2) dx$$

and so on.

(ii) *Taylor's series* method is used as follows :

If h be the step-size, $y_1 = y(x_0 + h)$ and $z_1 = z(x_0 + h)$. Then Taylor's algorithm for (1) and (2) gives

$$y_1 = y_0 + hy_0' + \frac{h^2}{2!} y_0'' + \frac{h^3}{3!} y_0''' + \dots \quad \dots(3)$$

$$z_1 = z_0 + hz_0' + \frac{h^2}{2!} z_0'' + \frac{h^3}{3!} z_0''' + \dots \quad \dots(4)$$

Differentiating (1) and (2) successively, we get y'', z'' , etc. So the values $y_0', y_0'', y_0''' \dots$ and $z_0', z_0'', z_0''' \dots$ are known. Substituting these in (3) and (4), we obtain y_1, z_1 for the next step.

Similarly, we have the algorithms

$$y_2 = y_1 + hy_1' + \frac{h^2}{2!} y_1'' + \frac{h^3}{3!} y_1''' + \dots \quad \dots(5)$$

$$z_2 = z_1 + hz_1' + \frac{h^2}{2!} z_1'' + \frac{h^3}{3!} z_1''' + \dots \quad \dots(6)$$

Since y_1 and z_1 are known, we can calculate y_1', y_1'', \dots and z_1', z_1'', \dots . Substituting these in (5) and (6), we get y_2 and z_2 .

Proceeding further, we can calculate the other values of y and z step by step.

(iii) *Runge-Kutta method* is applied as follows :

Starting at (x_0, y_0, z_0) and taking the step-sizes for x, y, z to be h, k, l respectively, the Runge-Kutta method gives,

$$k_1 = hf(x_0, y_0, z_0)$$

$$l_1 = h\phi(x_0, y_0, z_0)$$

$$k_2 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1, z_0 + \frac{1}{2}l_1\right)$$

$$l_2 = h\phi\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1, z_0 + \frac{1}{2}l_1\right)$$

$$k_3 = hf\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2, z_0 + \frac{1}{2}l_2\right)$$

$$l_3 = h\phi\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2, z_0 + \frac{1}{2}l_2\right)$$

$$k_4 = hf(x_0 + h, y_0 + k_3, z_0 + l_3)$$

$$l_4 = h\phi(x_0 + h, y_0 + k_3, z_0 + l_3)$$

$$\text{Hence } y_1 = y_0 + \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \quad \text{and} \quad z_1 = z_0 + \frac{1}{6}(l_1 + 2l_2 + 2l_3 + l_4)$$

To compute y_2 and z_2 , we simply replace x_0, y_0, z_0 by x_1, y_1, z_1 in the above formulae.

Example 32.23. Using Picard's method find approximate values of y and z corresponding to $x = 0.1$, given that $y(0) = 2, z(0) = 1$ and $dy/dx = x + z, dz/dx = x - y^2$.

Solution. Here $x_0 = 0, y_0 = 2, z_0 = 1$,

$$\frac{dy}{dx} = f(x, y, z) = x + z; \quad \text{and} \quad \frac{dz}{dx} = \phi(x, y, z) = x - y^2$$

$$\therefore y = y_0 + \int_{x_0}^x f(x, y, z) dx \quad \text{and} \quad z = z_0 + \int_{x_0}^x \phi(x, y, z) dx.$$

$$\text{First approximations} \quad y_1 = y_0 + \int_{x_0}^x \phi(x, y_0, z_0) dx = 2 + \int_0^x (x+1) dx = 2 + x + \frac{1}{2}x^2$$

$$z_1 = z_0 + \int_{x_0}^x \phi(x, y_0, z_0) dx = 1 + \int_0^x (x-4) dx = 1 - 4x + \frac{1}{2}x^2$$

$$\text{Second approximations} \quad y_2 = y_0 + \int_{x_0}^x f(x, y_1, z_1) dx = 2 + \int_0^x \left(x+1 - 4x + \frac{1}{2}x^2\right) dx$$

$$= 2 + x - \frac{3}{2}x^2 + \frac{x^3}{6}$$

$$z_2 = z_0 + \int_{x_0}^x \phi(x, y_1, z_1) dx$$

$$= 1 + \int_{x_0}^x \left[x - \left(2 + x - \frac{1}{2}x^2\right)^2\right] dx = 1 - 4x + \frac{3}{2}x^2 - x^3 - \frac{x^4}{4} - \frac{x^5}{20}.$$

$$\begin{aligned} \text{Third approximations } y_3 &= y_0 + \int_{x_0}^x f(x, y_2, z_2) dx \\ &= 2 + x - \frac{3}{2} x^2 - \frac{1}{2} x^3 - \frac{1}{4} x^4 - \frac{1}{20} x^5 - \frac{1}{120} x^6 \\ z_3 &= z_0 + \int_{x_0}^x \phi(x, y_2, z_2) dx \\ &= 1 - 4x - \frac{3}{2} x^2 + \frac{5}{3} x^3 + \frac{7}{12} x^4 - \frac{31}{60} x^5 + \frac{1}{12} x^6 - \frac{1}{252} x^7 \end{aligned}$$

and so on.

When

$$x = 0.1,$$

$$y_1 = 2.105, y_2 = 2.08517, y_3 = 2.08447$$

$$z_1 = 0.605, z_2 = 0.58397, z_3 = 0.58672.$$

Hence

$$y(0.1) = 2.0845, z(0.1) = 0.5867$$

correct to four decimal places.

Example 32.24. Solve the differential equations

$$\frac{dy}{dx} = 1 + xz, \quad \frac{dz}{dx} = -xy \text{ for } x = 0.3,$$

using fourth order Runge-Kutta method. Initial values are $x = 0, y = 0, z = 1$.

Solution. Here $f(x, y, z) = 1 + xz, \phi(x, y, z) = -xy$

$$x_0 = 0, y_0 = 0, z_0 = 1. \text{ Let us take } h = 0.3.$$

$$k_1 = h f(x_0, y_0, z_0) = 0.3 f(0, 0, 1) = 0.3 (1 + 0) = 0.3$$

$$l_1 = h \phi(x_0, y_0, z_0) = 0.3 (-0 \times 0) = 0$$

$$\begin{aligned} k_2 &= h f\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1, z_0 + \frac{1}{2}l_1\right) \\ &= (0.3) f(0.15, 0.15, 1) = 0.3 (1 + 0.15) = 0.345 \end{aligned}$$

$$\begin{aligned} l_2 &= h \phi\left(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1, z_0 + \frac{1}{2}l_1\right) \\ &= 0.3 [- (0.15) (0.15)] = -0.00675. \end{aligned}$$

$$\begin{aligned} k_3 &= h f\left(x_0 + \frac{h}{2}, y_0 + \frac{k_2}{2}, z_0 + \frac{l_2}{2}\right) \\ &= (0.3) f(0.15, 0.1725, 0.996625) \\ &= 0.3 [1 + 0.996625 \times 0.15] = 0.34485 \end{aligned}$$

$$\begin{aligned} l_3 &= h \phi\left(x_0 + \frac{h}{2}, y_0 + \frac{k_2}{2}, z_0 + \frac{l_2}{2}\right) \\ &= 0.3 [- (0.15) (0.1725)] = -0.007762 \end{aligned}$$

$$\begin{aligned} k_4 &= h f(x_0 + h, y_0 + k_3, z_0 + l_3) \\ &= (0.3) f(0.3, 0.34485, 0.99224) = 0.3893 \end{aligned}$$

$$\begin{aligned} l_4 &= h \phi(x_0 + h, y_0 + k_3, z_0 + l_3) \\ &= 0.3 [- (0.3) (0.34485)] = -0.03104 \end{aligned}$$

$$\text{Hence } y(x_0 + h) = y_0 + \frac{1}{6} (k_1 + 2k_2 + 2k_3 + k_4)$$

$$\text{i.e., } y(0.3) = 0 + \frac{1}{6} [0.3 + 2(0.345) + 2(0.34485) + 0.3893] = 0.34483$$

$$\text{and } z(x_0 + h) = z_0 + \frac{1}{6} (l_1 + 2l_2 + 2l_3 + l_4)$$

$$\text{i.e., } z(0.3) = 1 + \frac{1}{6} [0 + 2 + (-0.00675) + 2(-0.0077625) + (-0.03104)] = 0.98999$$

32.12 SECOND ORDER DIFFERENTIAL EQUATIONS

Consider the second order differential equation $\frac{d^2y}{dx^2} = f(x, y, \frac{dy}{dx})$

By writing $dy/dx = z$, it can be reduced to two first order simultaneous differential equations

$$\frac{dy}{dx} = z, \quad \frac{dz}{dx} = f(x, y, z)$$

These equations can be solved as explained above.

Example 32.25. Using Runge-Kutta method, solve $y'' = xy^2 - y^2$ for $x = 0.2$ correct to 4 decimal places. Initial conditions are $x = 0, y = 1, y' = 0$. (Delhi, 2002)

Solution. Let $dy/dx = z = f(x, y, z)$. Then $dz/dx = xz^2 - y^2 = \phi(x, y, z)$

We have $x_0 = 0, y_0 = 1, z_0 = 0, h = 0.2$.

Using k_1, k_2, \dots for $f(x, y, z)$ and I_1, I_2, \dots for $\phi(x, y, z)$, Runge-Kutta formulae become

$$\begin{aligned} k_1 &= h f(x_0, y_0, z_0) \\ &= 0.2(0) = 0 \end{aligned}$$

$$\begin{aligned} k_2 &= h f(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1, z_0 + \frac{1}{2}I_1) \\ &= 0.2(-0.1) = -0.02 \end{aligned}$$

$$\begin{aligned} k_3 &= h f(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2, z_0 + \frac{1}{2}I_2) \\ &= 0.2(-0.0999) = -0.02 \end{aligned}$$

$$\begin{aligned} k_4 &= h f(x_0 + h, y_0 + k_3, z_0 + I_3) \\ &= 0.2(-0.1958) = -0.0392 \end{aligned}$$

$$\therefore k = \frac{1}{6}(k_1 + 2k_2 + 2k_3 + k_4) \\ = -0.0199$$

$$\begin{aligned} I_1 &= h \phi(x_0, y_0, z_0) \\ &= 0.2(-1) = -0.2 \end{aligned}$$

$$\begin{aligned} I_2 &= h \phi(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_1, z_0 + \frac{1}{2}I_1) \\ &= 0.2(-0.999) = -0.1998 \end{aligned}$$

$$\begin{aligned} I_3 &= h \phi(x_0 + \frac{1}{2}h, y_0 + \frac{1}{2}k_2, z_0 + \frac{1}{2}I_2) \\ &= 0.2(-0.9791) = -0.1958 \end{aligned}$$

$$\begin{aligned} I_4 &= h \phi(x_0 + h, y_0 + k_3, z_0 + I_3) \\ &= 0.2(0.9527) = -0.1905 \end{aligned}$$

$$\begin{aligned} l &= \frac{1}{6}(I_1 + 2I_2 + 2I_3 + I_4) \\ &= -0.1970 \end{aligned}$$

Hence at $x = 0.2$,

$$y = y_0 + k = 1 - 0.0199 = 0.9801$$

and

$$y' = z = z_0 + l = 0 - 0.1970 = -0.1970.$$

Example 32.26. Given $y'' + xy' + y = 0, y(0) = 1, y'(0) = 0$, obtain y for $x = 0(0.1)0.3$ by any method. Further, continue the solution by Milne's method to calculate $y(0.4)$. (Anna, 2004; Madras, 2003 S)

Solution. Putting $y' = z$, the given equation reduces to the simultaneous equations

$$z' + xz + y = 0, y' = z \quad \dots(i)$$

We employ Taylor's series method to find y .

Differentiating the given equation n times, we get

$$y_{n+2} + xy_{n+1} + ny_n + y_n = 0$$

At $x = 0, (y_{n+2})_0 = -(n+1)(y_n)_0$

$\therefore y(0) = 1$, gives $y_2(0) = -1, y_4(0) = 32, y_6(0) = -5 \times 3, \dots$

and $y_1(0) = 0$ yields $y_3(0) = y_5(0) = \dots = 0$.

Expanding $y(x)$ by Taylor's series, we have

$$y(x) = y(0) + xy_1(0) + \frac{x^2}{2!} y_2(0) + \frac{x^3}{3!} y_3(0) + \dots$$

$$\therefore y(x) = 1 - \frac{x^2}{2!} + \frac{3}{4!} x^4 - \frac{5 \times 3}{6!} x^6 + \dots \quad \dots(ii)$$

$$\text{and } z(x) = y'(x) = -x + \frac{1}{2}x^3 - \frac{1}{8}x^5 = \dots = -xy \quad \dots(iii)$$

From (ii), we have

$$y(0.1) = 1 - \frac{(0.1)^2}{2!} + \frac{1}{8} (0.1)^4 - \dots = 0.995$$

$$y(0.2) = 1 - \frac{(0.2)^2}{2} + \frac{(0.2)^4}{8} - \dots = 0.9802$$

$$y(0.3) = 1 - \frac{(0.3)^2}{2} + \frac{(0.3)^4}{8} - \frac{(0.3)^6}{48} + \dots = 0.956$$

From (iii), we have

$$z(0.1) = -0.0995, z(0.2) = -0.196, z(0.3) = -0.2863.$$

Also from (i), $z'(x) = -(xz + y)$ $\therefore z'(0.1) = 0.985, z'(0.2) = -0.941, z'(0.3) = -0.87$.

Applying Milne's predictor formula, first to z and then to y , we obtain

$$z(0.4) = z(0) + \frac{4}{3}(0.1)(2z'(0.1) - z'(0.2) + 2z'(0.3))$$

$$= 0 + \left(\frac{0.4}{3}\right)(-1.79 + 0.941 - 1.74) = -0.3692$$

and $y(0.4) = y(0) + \frac{4}{3}(0.1)(2y'(0.1) - y'(0.2) + 2y'(0.3))$

$$= 0 + \left(\frac{0.4}{3}\right)(-0.199 + 0.196 - 0.5736) = 0.9231 \quad [\because y' = z]$$

Also $z'(0.4) = -(x(0.4)z(0.4) + y(0.4)) = [0.4(-0.3692) + 0.9231] = -0.7754$.

Now applying Milne's corrector formula, we get

$$z(0.4) = z(0.2) + \frac{h}{3}[z'(0.2) + 4z'(0.3) + z'(0.4)]$$

$$= -0.196 + \left(\frac{0.1}{3}\right)(-0.941 - 3.48 - 0.7754) = -0.3692$$

and $y(0.4) = y(0.2) + \frac{h}{3}[y'(0.2) + 4y'(0.3) + y'(0.4)]$

$$= 0.9802 + \left(\frac{0.1}{3}\right)(-0.196 - 1.1452 - 0.3692) = 0.9232$$

Hence $y(0.4) = 0.9232$ and $z(0.4) = -0.3692$.

PROBLEMS 32.5

1. Apply Picard's method to find the third approximation to the values of y and z , given that $dy/dx = z, dz/dx = x^2(y + z)$, given $y = 1, z = \frac{1}{2}$ when $x = 0$.
2. Solve the following differential equations using Taylor series method of the 4th order, for $x = 0.1$ and 0.2 , $\frac{dy}{dx} = xz + 1, \frac{dz}{dx} = -xy; y(0) = 0$ and $z(0) = 1$.
3. Find $y(0.1), z(0.1), y(0.2)$ and $z(0.2)$ from the system of equations $y' = x + z, z' = x - y^2$ given $y(0) = 0, z(0) = 1$ using Runge-Kutta of 4th order. (J.N.T.U., 2009)
4. Using Picard's method, obtain the second approximation to the solution of

$$\frac{d^2y}{dx^2} = x^3 \frac{dy}{dx} + x^3y \text{ so that } y(0) = 1, y'(0) = \frac{1}{2}.$$

5. Use Picard's method to approximate y when $x = 0.1$, given that $\frac{d^2y}{dx^2} + 2x \frac{dy}{dx} + y = 0$ and $y = 0.5, \frac{dy}{dx} = 0.1$, when $x = 0$.
6. Using Runge-Kutta method of order four, solve $y'' = y + xy', y(0) = 1, y'(0) = 0$ to find $y(0.2)$ and $y'(0.2)$.
7. Consider the second order value problem $y'' - 2y' + 2y = e^{2t} \sin t$ with $y(0) = -0.4$ and $y'(0) = -0.6$. Using the fourth order Runge-Kutta method, find $y(0.2)$. (Anna, 2003)

8. The angular displacement θ of a simple pendulum is given by the equation

$$\frac{d^2\theta}{dt^2} + \frac{g}{l} \sin \theta = 0$$

where $l = 98$ cm and $g = 980$ cm/sec². If $\theta = 0$ and $d\theta/dt = 4.472$ at $t = 0$, use Runge-Kutta method to find θ and $d\theta/dt$ when $t = 0.2$ sec.

32.13 BOUNDARY VALUE PROBLEMS

Such a problem requires the solution of a differential equation in a region R subject to the various conditions on the boundary of R . Practical applications give rise to many such problems. We shall discuss two-point linear boundary value problems of the following types :

(i) $\frac{d^2y}{dx^2} + \lambda(x) \frac{dy}{dx} + \mu(x)y = \gamma(x)$ with the conditions $y(x_0) = a$, $y(x_n) = b$.

(ii) $\frac{d^4y}{dx^4} + \lambda(x)y = \mu(x)$ with the conditions $y(x_0) = y'(x_0) = a$ and $y(x_n) = y'(x_n) = b$.

While there exist many numerical methods for solving such boundary value problems, the method of finite-differences is most commonly used. We shall explain this method in the next section.

32.14 FINITE-DIFFERENCE METHOD

In this method, the derivatives appearing in the differential equation and the boundary conditions are replaced by their finite-difference approximations and the resulting linear system of equations are solved by any standard procedure. These roots are the values of the required solution at the pivotal points.

The finite-difference approximations to the various derivatives are derived as under :

If $y(x)$ and its derivatives are single-valued continuous functions of x then by Taylor's expansion, we have

$$y(x+h) = y(x) + hy'(x) + \frac{h^2}{2!}y''(x) + \frac{h^3}{3!}y'''(x) + \dots \quad \dots(1)$$

and $y(x-h) = y(x) - hy'(x) + \frac{h^2}{2!}y''(x) - \frac{h^3}{3!}y'''(x) + \dots \quad \dots(2)$

Equation (1) gives $y'(x) = \frac{1}{h}[y(x+h) - y(x)] - \frac{h}{2}y''(x) - \dots$

i.e., $y'(x) = \frac{1}{h}[y(x+h) - y(x)] + O(h)$

which is the *forward difference approximation of $y'(x)$* with an error of the order h .

Similarly (2) gives $y'(x) = \frac{1}{h}[y(x) - y(x-h)] + O(h)$

which is the *backward difference approximation of $y'(x)$* with an error of the order h .

Subtracting (2) from (1), we obtain

$$y'(x) = \frac{1}{2h}[y(x+h) - y(x-h)] + O(h^2)$$

which is the *central-difference approximation of $y'(x)$* with an error of the order h^2 . Clearly this central difference approximation to $y'(x)$ is better than the forward or backward difference approximations and hence should be preferred.

Adding (1) and (2), we get

$$y''(x) = \frac{1}{h^2}[y(x+h) - 2y(x) + y(x-h)] + O(h^2)$$

which is the *central difference approximation of $y''(x)$* . Similarly we can derive central difference approximations to higher derivatives.

Hence the working expressions for the central difference approximations to the first four derivatives of y_i are as under :

$$y'_i = \frac{1}{2h} (y_{i+1} - y_{i-1}) \quad \dots(3)$$

$$y''_i = \frac{1}{h^2} (y_{i+1} - 2y_i + y_{i-1}) \quad \dots(4)$$

$$y'''_i = \frac{1}{2h^3} (y_{i+2} - 2y_{i+1} + 2y_{i-1} - y_{i-2}) \quad \dots(5)$$

$$y^{(iv)}_i = \frac{1}{h^4} (y_{i+2} - 4y_{i+1} + 6y_i - 4y_{i-1} + y_{i-2}) \quad \dots(6)$$

Obs. The accuracy of this method depends on the size of the sub-interval h and also on the order of approximation. As we reduce h , the accuracy improves but the number of equations to be solved also increases.

Example 32.27. Solve the equation $y'' = x + y$ with the boundary conditions $y(0) = y(1) = 0$. (Calicut, 1999)

Solution. We divide the interval $(0, 1)$ into four sub-intervals so that $h = 1/4$ and the pivot points are $x_0 = 0, x_1 = 1/4, x_2 = 1/2, x_3 = 3/4$ and $x_4 = 1$.

The differential equation is approximated as

$$\frac{1}{h^2} [y_{i+1} - 2y_i + y_{i-1}] = x_i + y_i$$

$$\text{or} \quad 16y_{i+1} - 33y_i + 16y_{i-1} = x_i, \quad i = 1, 2, 3.$$

Using $y_0 = y_4 = 0$, we get the system of equations

$$16y_2 - 33y_1 = \frac{1}{4}$$

$$16y_3 - 33y_2 + 16y_1 = \frac{1}{2}$$

$$-33y_3 + 16y_2 = \frac{3}{4}$$

Their solution gives

$$y_1 = -0.03488, y_2 = -0.05632, y_3 = -0.05003.$$

Obs. The exact solution being $y(x) = \frac{\sinh x}{\sinh 1} - x$, the error at each nodal point is given in the table:

x	Computed value $y(x)$	Exact value $y(x)$	Error
0.25	-0.03488	-0.03505	0.00017
0.5	-0.05632	-0.05659	0.00027
0.75	-0.05003	-0.05028	0.00025

Example 32.28. Determine values of y at the pivotal points of the interval $(0, 1)$, if y satisfies the boundary value problem $y'' + 81y = 81x^2, y(0) = y(1) = y'(0) = y''(1) = 0$. (Take $n = 3$).

Solution. Here $h = 1/3$ and the pivotal points are $x_0 = 0, x_1 = 1/3, x_2 = 2/3, x_3 = 1$. The corresponding y -values are $y_0 (= 0), y_1, y_2, y_3 (= 0)$.

Replacing y'' by its central difference approximation, the differential equation becomes

$$\frac{1}{h^4} (y_{i+2} - 4y_{i+1} + 6y_i - 4y_{i-1} + y_{i-2}) + 81y_i = 81x_i^2$$

$$\text{or} \quad y_{i+2} - 4y_{i+1} + 7y_i - 4y_{i-1} + y_{i-2} = x_i^2, \quad i = 1, 2$$

$$\text{At } i = 1, \quad y_3 - 4y_2 + 7y_1 - 4y_0 + y_{-1} = 1/9$$

$$\text{At } i = 2, \quad y_4 - 4y_3 + 7y_2 - 4y_1 + y_0 = 4/9$$

$$\text{Using } y_0 = y_3 = 0, \text{ we get } -4y_2 + 7y_1 - 4y_{-1} = 1/9$$

$$y_4 + 7y_1 - 4y_1 = 4/9 \quad \dots(ii)$$

... (i)

Regarding the conditions $y''_0 = y''_3 = 0$, we know that

$$x_i' = \frac{1}{h^2} (y_{i+1} - 2y_i + y_{i-1})$$

At $i = 0$,

$$y''_0 = 9(y_1 - 2y_0 + y_{-1})$$

[$\because y_0 = y''_0 = 0$] ... (iii)

or

At $i = 3$,

$$y''_3 = 9(y_4 - 2y_3 + y_2)$$

[$\because y_3 = y''_3 = 0$] ... (iv)

$$y_4 = -y_2$$

Using (iii), the equation (i) becomes

$$-4y_2 + 6y_1 = 1/9$$

... (v)

Using (iv), the equation (ii) reduces to

$$6y_2 - 4y_1 = 4/9$$

... (vi)

Solving (v) and (vi), we obtain

$$y_1 = 11/90 \text{ and } y_2 = 7/45.$$

Hence $y(1/3) = 0.1222$ and $y(2/3) = 0.1556$.

Example 32.29. The deflection of a beam is governed by the equation

$$\frac{d^4 y}{dx^4} + 81y = \phi(x)$$

where $\phi(x)$ is given by the table

	1/3	2/3	1,
$\phi(x)$	81	162	243,

and boundary condition $y(0) = y'(0) = y''(1) = y'''(1) = 0$. Evaluate the deflection at the pivotal points of the beam using three sub-intervals.

Solution. Here $h = 1/3$ and the pivotal points are $x_0 = 0, x_1 = 1/3, x_2 = 2/3, x_3 = 1$. The corresponding y -values are $y_0 (= 0), y_1, y_2, y_3$.

The given differential equation is approximated to

$$\frac{1}{h^4} (y_{i+2} - 4y_{i+1} + 6y_i - 4y_{i-1} + y_{i-2}) + 81y_i = \phi(x_i)$$

$$\text{At } i = 1, \quad y_3 - 4y_2 + 7y_1 - 4y_0 + y_{-1} = 1 \quad \dots (i)$$

$$\text{At } i = 2, \quad y_4 - 4y_3 + 7y_2 - 4y_1 + y_0 = 2 \quad \dots (ii)$$

$$\text{At } i = 3, \quad y_5 - 4y_4 + 7y_3 - 4y_2 + y_1 = 3 \quad \dots (iii)$$

$$\text{We have } y_0 = 0 \quad \dots (iv)$$

$$\text{Since } y_i' = \frac{1}{2h} (y_{i+1} - y_{i-1}) \quad \dots (v)$$

$$\therefore \text{for } i = 0, \quad 0 = y_0' = \frac{1}{2h} (y_1 - y_{-1}) \text{ i.e. } y_{-1} = y_1 \quad \dots (v)$$

$$\text{Since } y_i' = \frac{1}{h^2} (y_{i+1} - 2y_i + y_{i-1}) \quad \dots (vi)$$

$$\therefore \text{for } i = 3, \quad 0 = y_3' = \frac{1}{h^2} (y_4 - 2y_3 + y_2), \text{ i.e. } y_4 = 2y_3 - y_2 \quad \dots (vii)$$

$$\text{Also } y_i'' = \frac{1}{2h^3} (y_{i+2} - 2y_{i+1} - 2y_{i-1} - y_{i-2}) \quad \dots (viii)$$

$$\therefore \text{for } i = 3, \quad 0 = y_3'' = \frac{1}{2h^3} (y_5 - 2y_4 + 2y_2 - y_1) \quad \dots (ix)$$

$$y_5 = 2y_4 - 2y_2 + y_1$$

Using (iv) and (v), the equation (i) reduces to

$$y_3 - 4y_2 + 8y_1 = 1$$

... (viii)

Using (iv) and (vi), the equation (ii) becomes

$$-y_3 + 3y_2 - 2y_1 = 1$$

... (ix)

Using (vi) and (vii), the equation (iii) reduces to

$$3y_3 - 4y_2 + 2y_1 = 3 \quad \dots(x)$$

Solving (viii), (ix) and (x), we get

$$y_1 = 8/13, y_2 = 22/13, y_3 = 37/13.$$

Hence $y(1/3) = 0.6154, y(2/3) = 1.6923, y(1) = 2.8462.$

PROBLEMS 32.7

1. Solve the boundary value problem for $x = 0.5$:

$$\frac{d^2y}{dx^2} + y + 1 = 0, y(0) = y(1) = 0. \quad (\text{Take } n = 4)$$

2. Find an approximate solution of the boundary value problem:

$$y'' + 8(\sin^2 \pi y)y = 0, 0 \leq x \leq 1, y(0) = y(1) = 1. \quad (\text{Take } n = 4)$$

3. Solve the boundary value problem

$$xy'' + y = 0, y(1) = 1, y(2) = 2. \quad (\text{Take } n = 4)$$

4. Solve the equation

$$y'' - 4y' + 4y = e^{3x}, \text{ with the conditions } y(0) = 0, y(1) = -2, \text{ taking } n = 4.$$

5. Solve the boundary value problem $y'' - 64y + 10 = 0$ with $y(0) = y(1) = 0$ by the finite difference method. Compute the value of $y(0.5)$ and compare with the true value.

6. Solve the boundary value problem

$$y'' + xy' + y = 3x^2 + 2, y(0) = 0, y(1) = 1.$$

7. The boundary value problem governing the deflection of a beam of length 3 metres is given by

$$\frac{d^4y}{dx^4} + 2y = \frac{1}{9}x^2 + \frac{2}{3}x + 4, y(0) = y'(0) = y(3) = y'(3) = 0.$$

The beam is built-in at the left end ($x = 0$) and simply supported at the right end ($x = 3$). Determine y at the pivotal points $x = 1$ and $x = 2$.

8. Solve the boundary value problem,

$$\frac{d^4y}{dx^4} + 81y = 729x^2, y(0) = y'(0) = y''(1) = y'''(1) = 0. \quad (\text{Use } n = 3)$$

9. Solve the equation $y''' - y'' + y = x^2$ subject to the boundary conditions

$$y(0) = y'(0) = 0 \text{ and } y(1) = 2, y'(1) = 0. \quad (\text{Take } n = 5)$$

32.15 OBJECTIVE TYPE OF QUESTIONS

PROBLEMS 32.8

Select the correct answer or fill up the blanks in the following questions:

- Which of the following is a step by step method:
 (a) Taylor's (b) Adams-Basforth (c) Picard's (d) None.
- The finite difference scheme for the equation $2y'' + y = 5$ is
- If $y'' = x + y, y(0) = 1$ and $y^{(1)}(x) = 1 + x + x^2/2$, then by Picard's method, the value of $y^{(2)}(x)$ is
- The iterative formula of Euler's method for solving $y' = f(x, y)$ with $y(x_0) = y_0$, is
- Taylor's series for solution of first order ordinary differential equations is
- Using Runge-Kutta method of order four, the value of $y(0.1)$ for $y' = x - 2y, y(0) = 1$ taking $h = 0.1$ is
 (a) 0.813 (b) 0.825 (c) 0.0825 (d) none.
- Given y_0, y_1, y_2, y_3 , Milne's corrector formula to find y_4 for $dy/dx = f(x, y)$, is
- The second order Runge-Kutta formula is
- Adams-Basforth predictor formula to solve $y' = f(x, y)$ given $y_0 = y(x_0)$ is
- The multi-step methods available for solving ordinary differential equations are
- To predict Adam's method atleast values of y , prior to the desired value, are required.
- Taylor's series solution of $y' = -xy, y(0) = 1$ upto x^4 is

13. Using modified Euler's method, the value of $y(0.1)$ for $\frac{dy}{dx} = x - y$, $y(0) = 1$ is
 (a) 0.809 (b) 0.909 (c) 0.0809 (d) none.
14. Milne's Predictor formula is
 15. Adam's corrector formula is
 16. Using Euler's method, $dy/dx = (y - 2x)/y$, $y(0) = 1$; gives $y(0.1) = \dots$
17. $\frac{d^2y}{dx^2} + y^2 \frac{dy}{dx} + y = 0$ is equivalent to a set of two first order differential equations and
18. The formula for the 4th order Runge-Kutta method is
 19. Taylor's series method will be useful to give some of Milne's method.
 20. The name of two self-starting methods to solve $y' = f(x, y)$ given $y(x_0) = y_0$ are
 21. In the derivation of fourth order Runge-Kutta formula, it is called fourth order because
 22. If $y' = x$, $y(0) = 1$ then by Picard's method, the value of $y(1)$ is
 (a) 0.915 (b) 0.905 (c) 0.981 (d) none.
23. The finite difference scheme of the differential equation $y'' + 2y = 0$ is
 24. If $y' = -y$, $y(0) = 1$, the Euler's method, the value of $y(1)$ is
 (a) 0.99 (b) 0.999 (c) 0.981 (d) none.
25. In Euler's method if h is small the method is too slow, if h is large, it gives inaccurate value. (True or False)
 26. Runge-Kutta method is a self-starting method. (True or False)
 27. Predictor-corrector methods are self-starting methods. (True or False)

Numerical Solution of Partial Differential Equations

Solution of Poisson's equations. 7. Parabolic equations. 8. Solution of heat equation. 9. Hyperbolic equations. 10. Solution of wave equation. 11. Objective Type of Questions.

33.1 INTRODUCTION

There are many boundary value problems which involve partial differential equations. Only a few of these equations can be solved by analytical methods. In most cases, we depend on the numerical solution of such partial differential equations. Of the various numerical methods available for solving these equations, the method of finite differences is most commonly used.

In this method, the derivatives appearing in the equation and the boundary conditions are replaced by their finite-difference approximations. Then the given equation is changed to a difference equation which is solved by iterative procedures. This process is slow but gives good results of boundary value problems. An added advantage of this method is that the computation can be done by electronic computer. Here we shall apply this method to the solution of important applied partial differential equations. For a detailed study, the reader should refer to author's book '*Numerical Methods in Engineering and Science*'.

33.2 CLASSIFICATION OF SECOND ORDER EQUATIONS

The general linear partial differential equation of the second order in two independent variables is of the form.

$$A(x, y) \frac{\partial^2 u}{\partial x^2} + B(x, y) \frac{\partial^2 u}{\partial x \partial y} + C(x, y) \frac{\partial^2 u}{\partial y^2} + F\left(x, y, u, \frac{\partial u}{\partial x}, \frac{\partial u}{\partial y}\right) = 0$$

Such a partial differential equation is said to be

- (i) **elliptic**, if $B^2 - 4AC < 0$,
- (ii) **parabolic**, if $B^2 - 4AC = 0$,
- and (iii) **hyperbolic**, if $B^2 - 4AC > 0$.

Example 33.1. Classify the following equations :

$$(i) \frac{\partial^2 u}{\partial x^2} + 4 \frac{\partial^2 u}{\partial x \partial y} + 4 \frac{\partial^2 u}{\partial y^2} - \frac{\partial u}{\partial x} + 2 \frac{\partial u}{\partial y} = 0 \quad (ii) x^2 \frac{\partial^2 u}{\partial x^2} + (1 - y^2) \frac{\partial^2 u}{\partial y^2} = 0, -\infty < x < \infty, -1 < y < 1$$

(Madras, 2003)

$$(iii) (1 + x^2) \frac{\partial^2 u}{\partial x^2} + (5 + 2x^2) \frac{\partial^2 u}{\partial x \partial t} + (4 + x^2) \frac{\partial^2 u}{\partial t^2} = 0.$$

Solution. (i) Comparing this equation with (1) above, we find that

$$A = 1, B = 4, C = 4$$

$$\therefore B^2 - 4AC = (4)^2 - 4 \times 1 \times 4 = 0$$

So the equation is parabolic.

(ii) Here $A = x^2, B = 0, C = 1 - y^2$

$$\therefore B^2 - 4AC = 0 - 4x^2(1 - y^2) = 4x^2(y^2 - 1)$$

For all x between $-\infty$ and ∞ , x^2 is positive

For all y between -1 and 1 , $y^2 < 1 \quad \therefore B^2 - 4AC < 0$

Hence the equation is elliptic.

(iii) Here $A = 1 + x^2, B = 5 + 2x^2, C = 4 + x^2$

$$\therefore B^2 - 4AC = (5 + 2x^2)^2 - 4(1 + x^2)(4 + x^2) = 9 \text{ i.e. } > 0$$

So the equation is hyperbolic.

PROBLEMS 33.1

- What is the classification of the equation $f_{xx} + 2f_{xy} + f_{yy} = 0$.
- Determine whether the following equation is elliptic or hyperbolic?

$$(x+1)u_{xx} - 2(x+2)u_{xy} + (x+3)u_{yy} = 0.$$
- Classify the equations (i) $y^2 u_{xx} - 2xy u_{xy} + x^2 u_{yy} + 2u_x - 3u = 0$ (Madras, 2000 S)
(ii) $x^2 \frac{\partial^2 u}{\partial x^2} + y^2 \frac{\partial^2 u}{\partial y^2} = x \frac{\partial u}{\partial x} - y \frac{\partial u}{\partial y}$ (P.T.U., 2009 S)
(iii) $\frac{3\partial^2 u}{\partial x^2} + 4 \frac{\partial^2 u}{\partial x \partial y} + 6 \frac{\partial^2 u}{\partial y^2} - 2 \frac{\partial u}{\partial x} + \frac{\partial u}{\partial y} - u = 0.$ (Anna, 2008)
- In which parts of the (x, y) plane is the following equation elliptic?

$$\partial^2 u / \partial x^2 + \partial^2 u / \partial x \partial y + (x^2 + 4y^2) \partial^2 u / \partial y^2 = 2 \sin(xy).$$

33.3 FINITE-DIFFERENCE APPROXIMATIONS TO DERIVATIVES

Consider a rectangular region R in the x - y plane. Divide this region into a rectangular network of sides $\Delta x = h$ and $\Delta y = k$ as shown in Fig. 33.1. The points of intersection of the dividing lines are called *mesh points*, *nodal points* or *grid points*.

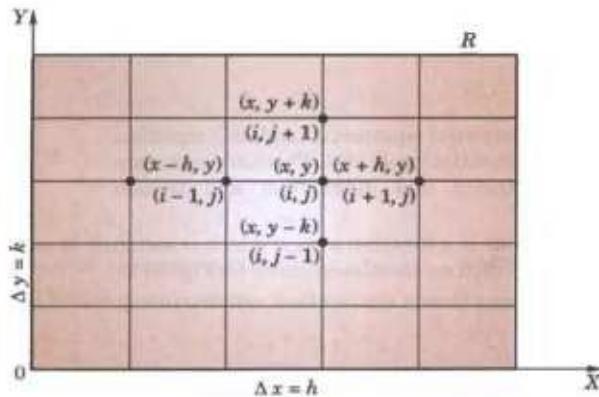

Fig. 33.1

Then we have the finite difference approximations for the partial derivatives in x -direction (§ 32.12) :

$$\frac{\partial u}{\partial x} = \frac{u(x+h, y) - u(x, y)}{h} + O(h)$$

$$= \frac{u(x, y) - u(x-h, y)}{h} + O(h) = \frac{u(x+h, y) - u(x-h, y)}{2h} + O(h^2)$$

and $\frac{\partial^2 u}{\partial x^2} = \frac{u(x-h, y) - 2u(x, y) + u(x+h, y)}{h^2} + O(h^2)$

Writing $u(x, y) = u(ih, jk)$ as simply $u_{i,j}$, the above approximations become

$$u_x = \frac{u_{i+1,j} - u_{i,j}}{h} + O(h) \quad \dots(1)$$

$$= \frac{u_{i,j} - u_{i-1,j}}{h} + O(h) \quad \dots(2)$$

$$= \frac{u_{i+1,j} - u_{i-1,j}}{2h} + O(h^2) \quad \dots(3)$$

and $u_{xx} = \frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{h^2} + O(h^2) \quad \dots(4)$

Similarly we have the approximations for the derivatives w.r.t. y :

$$u_y = \frac{u_{i,j+1} - u_{i,j}}{k} + O(k) \quad \dots(5)$$

$$= \frac{u_{i,j} - u_{i,j-1}}{k} + O(k) \quad \dots(6)$$

$$= \frac{u_{i,j+1} - u_{i,j-1}}{2k} + O(k^2) \quad \dots(7)$$

and $u_{yy} = \frac{u_{i,j-1} - 2u_{i,j} + u_{i,j+1}}{k^2} + O(k^2) \quad \dots(8)$

Replacing the derivatives in any partial differential equation by their corresponding difference approximations (1) to (8), we obtain the finite-difference analogues of the given equations.

33.4 ELLIPTIC EQUATIONS

The Laplace's equation

$$\nabla^2 u = \frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$$

and the Poisson's equation

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y)$$

are examples of elliptic partial differential equations. Laplace's equation arises in steady-state flow and potential problems. Poisson's equation arises in fluid mechanics, electricity and magnetism and torsion problems.

The solution of these equations is a function $u(x, y)$ which is satisfied at every point of a region R subject to certain boundary conditions specified on the closed curve C (Fig. 33.2).

In general, problems concerning steady viscous flow, equilibrium stresses in elastic structures etc., lead to elliptic type of equations.

33.5 SOLUTION OF LAPLACE'S EQUATION*

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0 \quad \dots(1)$$

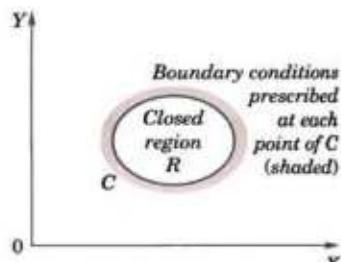

Fig. 33.2

* See p. 619

Consider a rectangular region R for which $u(x, y)$ is known at the boundary. Divide this region into a network of square mesh of side h , as shown in Fig. 33.3 (assuming that an exact sub-division of R is possible). Replacing the derivatives in (1) by their difference approximations, we have

$$\begin{aligned} \frac{1}{h^2} [u_{i-1,j} - 2u_{i,j} + u_{i+1,j}] \\ + \frac{1}{h^2} [u_{i,j-1} - 2u_{i,j} + u_{i,j+1}] = 0 \\ \text{or } u_{i,j} = \frac{1}{4} [u_{i-1,j} + u_{i+1,j} + u_{i,j+1} + u_{i,j-1}] \quad \dots(2) \end{aligned}$$

This shows that the value of $u_{i,j}$ at any interior mesh point is the average of its values at four neighbouring points to the left, right, above and below. (2) is called the **standard 5-point formula** which is exhibited in Fig. 33.4.

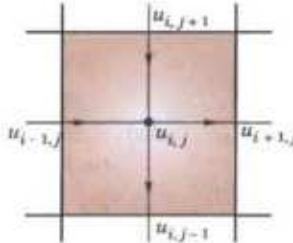

Fig. 33.4

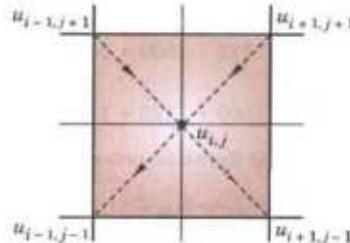

Fig. 33.5

Sometimes a formula similar to (2) is used which is given by

$$u_{i,j} = \frac{1}{4} (u_{i-1,j+1} + u_{i+1,j-1} + u_{i+1,j+1} + u_{i-1,j-1}) \quad \dots(3)$$

This shows that the value of $u_{i,j}$ is the average of its values at the four neighbouring diagonal mesh points. (3) is called the **diagonal 5-point formula** which is represented in Fig. 33.5. Although (3) is less accurate than (2), yet it serves as a reasonably good approximation for obtaining the starting values at the mesh points.

Now to find the initial values of u at the interior mesh points, we first use diagonal five point formula (3) and compute $u_{3,3}$, $u_{2,4}$, $u_{4,4}$, $u_{4,2}$ and $u_{2,2}$, in this order. Thus we get,

$$\begin{aligned} u_{3,3} &= \frac{1}{4} (b_{1,5} + b_{5,1} + b_{5,5} + b_{1,1}) ; u_{2,4} = \frac{1}{4} (b_{1,5} + u_{3,3} + b_{3,5} + b_{1,3}) \\ u_{4,4} &= \frac{1}{4} (b_{3,5} + b_{5,3} + b_{5,5} + u_{3,3}) ; u_{4,2} = \frac{1}{4} (u_{3,3} + b_{5,1} + b_{3,1} + b_{5,3}) \\ u_{2,2} &= \frac{1}{4} (b_{1,3} + b_{3,1} + u_{3,3} + b_{1,1}) \end{aligned}$$

The values at the remaining interior points i.e. $u_{2,3}$, $u_{3,4}$, $u_{4,3}$ and $u_{3,2}$ are computed by the standard five-point formula (2). Thus, we obtain

$$\begin{aligned} u_{2,3} &= \frac{1}{4} (b_{1,3} + u_{3,3} + u_{2,4} + u_{2,2}), u_{3,4} = \frac{1}{4} (u_{2,4} + u_{4,4} + b_{3,5} + u_{3,3}) \\ u_{4,3} &= \frac{1}{4} (u_{3,3} + b_{5,3} + u_{4,4} + u_{4,2}), u_{3,2} = \frac{1}{4} (u_{2,2} + u_{4,2} + u_{3,3} + u_{3,1}) \end{aligned}$$

Having found all the nine values of $u_{i,j}$ once, their accuracy is improved by repeated application of (2) in the form

$$u^{(n+1)}_{i,j} = \frac{1}{4} [u^{(n+1)}_{i-1,j} + u^{(n)}_{i+1,j} + u^{(n+1)}_{i,j+1} + u^{(n)}_{i,j-1}]$$

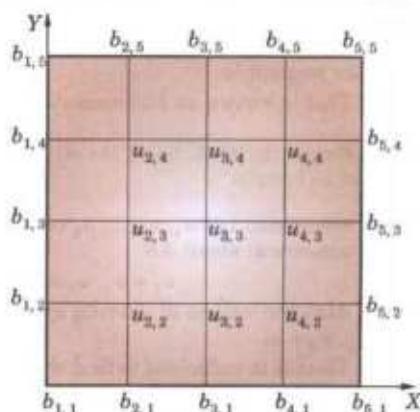

Fig. 33.3

This formula utilises the latest iterative value available and scans the mesh points symmetrically from left to right along successive rows. This process is repeated till the difference of values in one round and the next becomes negligible.

This is known as *Liebmann's iteration process*.

Example 33.2. Solve the elliptic equation $u_{xx} + u_{yy} = 0$ for the square mesh of Fig. 33.6 with boundary values as shown.
(Rohtak, 2005 ; V.T.U., 2005)

Solution. Let u_1, u_2, \dots, u_9 be the values of u at the interior mesh-points. Since the boundary values of u are symmetrical about AB .

$$\therefore u_7 = u_1, u_8 = u_2, u_9 = u_3.$$

Also the values of u being symmetrical about CD , $u_3 = u_1$, $u_6 = u_4$, $u_9 = u_7$.

Thus it is sufficient to find the values u_1, u_2, u_4 and u_5 .

Now we find their initial value in the following order :

$$u_5 = \frac{1}{4}(2000 + 2000 + 1000 + 1000) = 1500 \quad (\text{Std. formula})$$

$$u_1 = \frac{1}{4}(0 + 1500 + 1000 + 2000) = 1125 \quad (\text{Diag. formula})$$

$$u_2 = \frac{1}{4}(1125 + 1125 + 1000 + 1500) = 1188 \quad (\text{Std. formula})$$

$$u_4 = \frac{1}{4}(2000 + 1500 + 1125 + 1125) = 1438 \quad (\text{Std. formula})$$

We carry out the iteration process using the formulae :

$$u_1^{(n+1)} = \frac{1}{4}[1000 + u_2^{(n)} + 500 + u_4^{(n)}]$$

$$u_2^{(n+1)} = \frac{1}{4}[u_1^{(n+1)} + u_1^{(n)} + 1000 + u_5^{(n)}]$$

$$u_4^{(n+1)} = \frac{1}{4}[2000 + u_5^{(n)} + u_1^{(n+1)} + u_1^{(n)}]$$

$$u_5^{(n+1)} = \frac{1}{4}[u_4^{(n+1)} + u_4^{(n)} + u_2^{(n+1)} + u_2^{(n)}]$$

First iteration : (put $n = 0$)

$$u_1^{(1)} = \frac{1}{4}(1000 + 1188 + 500 + 1438) = 1032$$

$$u_2^{(1)} = \frac{1}{4}(1032 + 1032 + 1000 + 1500) = 1141$$

$$u_4^{(1)} = \frac{1}{4}(2000 + 1500 + 1032 + 1032) = 1391$$

$$u_5^{(1)} = \frac{1}{4}(1391 + 1391 + 1141 + 1141) = 1266$$

Second iteration : (put $n = 1$)

$$u_1^{(2)} = \frac{1}{4}(1000 + 1141 + 500 + 1391) = 1008$$

$$u_2^{(2)} = \frac{1}{4}(1008 + 1008 + 1000 + 1266) = 1069$$

$$u_4^{(2)} = \frac{1}{4}(2000 + 1266 + 1008 + 1008) = 1321$$

$$u_5^{(2)} = \frac{1}{4}(1321 + 1321 + 1069 + 1069) = 1195$$

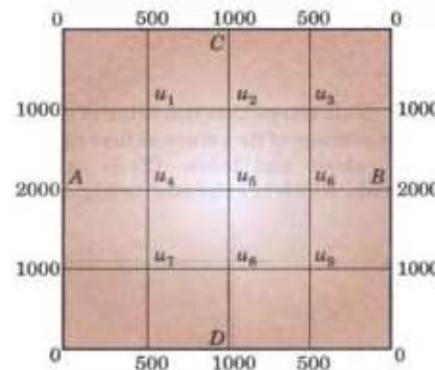

Fig. 33.6

Third iteration :

$$\begin{aligned} u_1^{(3)} &= \frac{1}{4}(1000 + 1069 + 500 + 1321) = 973 \\ u_2^{(3)} &= \frac{1}{4}(973 + 973 + 1000 + 1195) = 1035 \\ u_4^{(3)} &= \frac{1}{4}(2000 + 1195 + 973 + 973) = 1288 \\ u_5^{(3)} &= \frac{1}{4}(1288 + 1288 + 1035 + 1035) = 1162 \end{aligned}$$

Fourth iteration :

$$\begin{aligned} u_1^{(4)} &= \frac{1}{4}(1000 + 1135 + 500 + 1288) = 956 \\ u_2^{(4)} &= \frac{1}{4}(956 + 956 + 1000 + 1162) = 1019 \\ u_4^{(4)} &= \frac{1}{4}(2000 + 1162 + 956 + 956) = 1269 \\ u_5^{(4)} &= \frac{1}{4}(1269 + 1269 + 1019 + 1019) = 1144 \end{aligned}$$

Fifth iteration :

$$\begin{aligned} u_1^{(5)} &= \frac{1}{4}(1000 + 1019 + 500 + 1269) = 947 \\ u_2^{(5)} &= \frac{1}{4}(947 + 947 + 1000 + 1144) = 1010 \\ u_4^{(5)} &= \frac{1}{4}(2000 + 1144 + 947 + 947) = 1260 \\ u_5^{(5)} &= \frac{1}{4}(1260 + 1260 + 1010 + 1010) = 1135 \end{aligned}$$

Similarly,

$$\begin{aligned} u_1^{(6)} &= 942, u_2^{(6)} = 1005, u_4^{(6)} = 1255, u_5^{(6)} = 1130 \\ u_1^{(7)} &= 940, u_2^{(7)} = 1003, u_4^{(7)} = 1253, u_5^{(7)} = 1128 \\ u_1^{(8)} &= 939, u_2^{(8)} = 1002, u_4^{(8)} = 1252, u_5^{(8)} = 1127 \\ u_1^{(9)} &= 939, u_2^{(9)} = 1001, u_4^{(9)} = 1251, u_5^{(9)} = 1126 \end{aligned}$$

Thus there is negligible difference between the values obtained in the eighth and ninth iterations.

Hence $u_1 = 939$, $u_2 = 1001$, $u_4 = 1251$ and $u_5 = 1126$.

Example 33.3. Given the values of $u(x, y)$ on the boundary of the square in the Fig. 33.7, evaluate the function $u(x, y)$ satisfying the Laplace equation $\nabla^2 u = 0$ at the pivotal points of this figure.

(Bhopal, 2009 ; Madras, 2003)

Solution. To get the initial values of u_1, u_2, u_3, u_4 , we assume $u_4 = 0$. Then

$$\begin{aligned} u_1 &= \frac{1}{4}(1000 + 0 + 1000 + 2000) = 1000 && \text{(Diag. formula)} \\ u_2 &= \frac{1}{4}(1000 + 500 + 1000 + 0) = 625 && \text{(Std. formula)} \\ u_3 &= \frac{1}{4}(2000 + 0 + 1000 + 500) = 875 && \text{(Std. formula)} \\ u_4 &= \frac{1}{4}(875 + 0 + 625 + 0) = 375 && \text{(Std. formula)} \end{aligned}$$

We carry out the successive iterations, using the formulae

$$u_1^{(n+1)} = \frac{1}{4}[2000 + u_2^{(n)} + 1000 + u_3^{(n)}]$$

$$u_2^{(n+1)} = \frac{1}{4}[u_1^{(n+1)} + 500 + 1000 + u_4^{(n)}]$$

$$u_3^{(n+1)} = \frac{1}{4} [2000 + u_4^{(n)} + u_1^{(n+1)} + 500]$$

$$u_4^{(n+1)} = \frac{1}{4} [u_3^{(n+1)} + 0 + u_2^{(n+1)} + 0]$$

First iteration : (put $n = 0$)

$$u_1^{(1)} = \frac{1}{4} (2000 + 625 + 1000 + 875) = 1125$$

$$u_2^{(1)} = \frac{1}{4} (1125 + 500 + 1000 + 375) = 750$$

$$u_3^{(1)} = \frac{1}{4} (2000 + 375 + 1125 + 500) = 1000$$

$$u_4^{(1)} = \frac{1}{4} (1000 + 0 + 750 + 0) = 438$$

Second iteration : (put $n = 1$)

$$u_1^{(2)} = \frac{1}{4} (2000 + 750 + 1000 + 1000) = 1188$$

$$u_2^{(2)} = \frac{1}{4} (1188 + 500 + 1000 + 438) = 782$$

$$u_3^{(2)} = \frac{1}{4} (2000 + 438 + 1188 + 500) = 1032$$

$$u_4^{(2)} = \frac{1}{4} (1032 + 0 + 782 + 0) = 454$$

Third iteration : (put $n = 2$)

$$u_1^{(3)} = \frac{1}{4} (2000 + 782 + 1000 + 1032) = 1204$$

$$u_2^{(3)} = \frac{1}{4} (1204 + 500 + 1000 + 454) = 789$$

$$u_3^{(3)} = \frac{1}{4} (2000 + 454 + 1204 + 500) = 1040$$

$$u_4^{(3)} = \frac{1}{4} (1040 + 0 + 789 + 0) = 458$$

Similarly, $u_1^{(4)} = 1207, u_2^{(4)} = 791, u_3^{(4)} = 1041, u_4^{(4)} = 458$

and $u_1^{(5)} = 1208, u_2^{(5)} = 791.5, u_3^{(5)} = 1041.5, u_4^{(5)} = 458.25$

Thus there is no significant difference between the fourth and fifth iteration values.

Hence $u_1 = 1208, u_2 = 792, u_3 = 1042$ and $u_4 = 458$.

Example 33.4. Solve the Laplace equation $u_{xx} + u_{yy} = 0$ given that (Fig. 33.7).

Solution. We first find the initial values in the following order :

$$u_5 = \frac{1}{4} (0 + 17 + 21 + 12.1) = 12.5 \quad (\text{Std. formula})$$

$$u_1 = \frac{1}{4} (0 + 12.5 + 0 + 17) = 7.4 \quad (\text{Diag. formula})$$

$$u_3 = \frac{1}{4} (12.5 + 18.6 + 17 + 21) = 17.28 \quad (\text{Diag. formula})$$

$$u_7 = \frac{1}{4} (12.5 + 0 + 0 + 12.1) = 6.15 \quad (\text{Diag. formula})$$

$$u_9 = \frac{1}{4} (12.5 + 9 + 21 + 12.1) = 13.65 \quad (\text{Diag. formula})$$

$$u_2 = \frac{1}{4} (17 + 12.5 + 7.4 + 17.3) = 13.55 \quad (\text{Std. formula})$$

$$u_4 = \frac{1}{4} (7.4 + 6.2 + 0 + 12.5) = 6.52 \quad (\text{Std. formula})$$

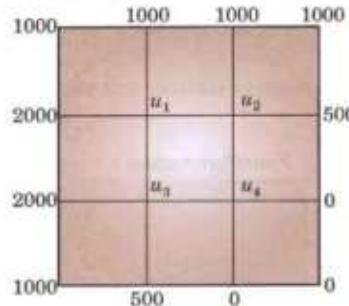

Fig. 33.7

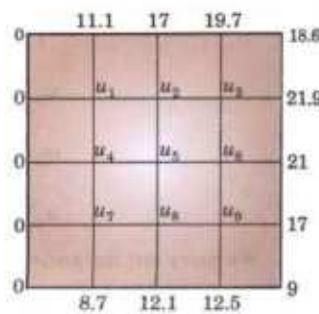

Fig. 33.8

$$u_6 = \frac{1}{4} (17.3 + 13.7 + 12.5 + 21) = 16.12 \quad (\text{Std. formula})$$

$$u_8 = \frac{1}{4} (12.5 + 12.1 + 6.2 + 13.7) = 11.12 \quad (\text{Std. formula})$$

Now we carry out the iteration process using the Standard formula :

$$u_1^{(n+1)} = \frac{1}{4} [(0 + 11.1 + u_4^{(n)} + u_2^{(n)})]$$

$$u_2^{(n+1)} = \frac{1}{4} [(u_1^{(n+1)} + 17 + u_5^{(n)} + u_3^{(n)})]$$

$$u_3^{(n+1)} = \frac{1}{4} [(u_2^{(n+1)} + 19.7 + u_6^{(n)} + 21.9)]$$

$$u_4^{(n+1)} = \frac{1}{4} [(u_1^{(n+1)} + 19.7 + u_7^{(n)} + u_5^{(n)})]$$

$$u_5^{(n+1)} = \frac{1}{4} [(u_4^{(n+1)} + u_2^{(n+1)} + u_8^{(n)} + u_6^{(n)})]$$

$$u_6^{(n+1)} = \frac{1}{4} [(u_5^{(n+1)} + u_3^{(n+1)} + u_9^{(n)} + 21)]$$

$$u_7^{(n+1)} = \frac{1}{4} [0 + (u_4^{(n+1)} + 8.7 + u_8^{(n)})]$$

$$u_8^{(n+1)} = \frac{1}{4} [(u_7^{(n+1)} + u_5^{(n+1)} + 12.1 + u_9^{(n)})]$$

$$u_9^{(n+1)} = \frac{1}{4} [(u_8^{(n+1)} + u_6^{(n)} + 12.8 + 17)]$$

First iteration (put $n = 0$, in the above results)

$$u_1^{(1)} = \frac{1}{4} (0 + 11.1 + u_4^{(0)} + u_2^{(0)}) = \frac{1}{4} (0 + 11.1 + 6.52 + 13.55) = 7.79$$

$$u_2^{(1)} = \frac{1}{4} (7.79 + 17 + 12.5 + 17.28) = 13.64$$

$$u_3^{(1)} = \frac{1}{4} (13.64 + 19.7 + 16.12 + 21.9) = 12.84$$

$$u_4^{(1)} = \frac{1}{4} (0 + 7.79 + 6.15 + 12.5) = 6.61$$

$$u_5^{(1)} = \frac{1}{4} (6.61 + 13.64 + 11.12 + 16.12) = 11.88$$

$$u_6^{(1)} = \frac{1}{4} (11.88 + 17.84 + 13.65 + 21) = 16.09$$

$$u_7^{(1)} = \frac{1}{4} (0 + 6.61 + 8.7 + 11.12) = 6.61$$

$$u_8^{(1)} = \frac{1}{4} (6.61 + 11.88 + 12.1 + 13.65) = 11.06$$

$$u_9^{(1)} = \frac{1}{4} (11.06 + 16.09 + 12.8 + 17) = 12.238$$

Second iteration (put $n = 1$)

$$u_1^{(2)} = \frac{1}{4} (0 + 11.1 + 6.61 + 13.64) = 7.84$$

$$u_2^{(2)} = \frac{1}{4} (7.84 + 17 + 11.88 + 17.84) = 16.64$$

$$u_3^{(2)} = \frac{1}{4} (13.64 + 19.7 + 16.09 + 21.9) = 17.83$$

$$u_4^{(2)} = \frac{1}{4} (0 + 7.84 + 6.61 + 11.88) = 6.58$$

$$u_5^{(2)} = \frac{1}{4} (6.58 + 13.64 + 11.06 + 16.09) = 11.84$$

$$u_6^{(2)} = \frac{1}{4} (11.84 + 17.83 + 14.24 + 21) = 16.23$$

$$u_7^{(2)} = \frac{1}{4} (0 + 6.58 + 8.7 + 11.06) = 6.58$$

$$u_8^{(2)} = \frac{1}{4} (6.58 + 11.84 + 12.1 + 14.24) = 11.19$$

$$u_9^{(2)} = \frac{1}{4} (11.19 + 16.23 + 12.8 + 17) = 14.30$$

Third iteration (put n = 2)

$$u_1^{(3)} = \frac{1}{4} (0 + 11.1 + 6.58 + 13.64) = 7.83$$

$$u_2^{(3)} = \frac{1}{4} (7.83 + 17 + 11.84 + 17.83) = 13.637$$

$$u_3^{(3)} = \frac{1}{4} (13.63 + 19.7 + 16.23 + 21.9) = 17.86$$

$$u_4^{(3)} = \frac{1}{4} (0 + 7.83 + 6.58 + 11.84) = 6.56$$

$$u_5^{(3)} = \frac{1}{4} (6.56 + 13.63 + 11.19 + 16.23) = 11.90$$

$$u_6^{(3)} = \frac{1}{4} (11.90 + 17.86 + 14.30 + 21) = 16.27$$

$$u_7^{(3)} = \frac{1}{4} (0 + 6.56 + 8.7 + 11.19) = 6.61$$

$$u_8^{(3)} = \frac{1}{4} (6.61 + 11.90 + 12.1 + 14.30) = 11.23$$

$$u_9^{(3)} = \frac{1}{4} (11.23 + 16.27 + 12.8 + 17) = 14.32$$

Similarly, $u_1^{(4)} = 7.82, u_2^{(4)} = 13.65, u_3^{(4)} = 17.88, u_4^{(4)} = 6.58, u_5^{(4)} = 11.94, u_6^{(4)} = 16.28,$

$$u_7^{(4)} = 6.63, u_8^{(4)} = 11.25, u_9^{(4)} = 14.33$$

$$u_1^{(5)} = 7.83, u_2^{(5)} = 13.66, u_3^{(5)} = 17.89, u_4^{(5)} = 6.50, u_5^{(5)} = 11.95, u_6^{(5)} = 16.29,$$

$$u_7^{(5)} = 6.64, u_8^{(5)} = 11.25, u_9^{(5)} = 14.34$$

33.6 SOLUTION OF POISSON'S EQUATION*

$$\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y) \quad \dots(1)$$

This is an *elliptic equation* which can be solved numerically at the interior mesh points of a square network when the boundary values are known. The standard 5-point formula for (1) takes the form

$$u_{i-1,j} + u_{i+1,j} + u_{i,j+1} + u_{i,j-1} - 4u_{i,j} = h^2 f(ih, jh) \quad \dots(2)$$

By applying (2) at each mesh-point, we arrive at linear equations in the pivotal values i, j . These equations can be solved by Gauss-Seidal iteration method (p. 938).

Example 33.5. Solve the Poisson equation $u_{xx} + u_{yy} = -81xy, 0 < x < 1, 0 < y < 1$ given that $u(0, y) = 0, u(x, 0) = 0, u(1, y) = 100, u(x, 1) = 100$ and $h = 1/3$. (Anna, 2005)

Solution. Here $h = 1/3$ $u_{i,j-1} u_{i,j}$ (Fig. 33.9)

The standard 5-point formula for the given equation is

$$u_{i-1,j} + u_{i+1,j} + u_{i,j+1} + u_{i,j-1} - 4u_{i,j} = h^2 f(ih, jh) = h^2 [-81(ih, jh)] = h^4 (-81) ij = -ij \dots (i)$$

For u_1 ($i = 1, j = 2$), (i) gives $0 + u_2 + u_3 + 100 - 4u_1 = -2$

$$\text{i.e., } -4u_1 + u_2 + u_3 = -102 \dots (ii)$$

For u_2 ($i = 2, j = 2$), (i) gives $u_1 + 100 + u_4 + 100 - 4u_2 = -4$

$$\text{i.e., } u_1 - 4u_2 + u_4 = -204 \dots (iii)$$

For u_3 ($i = 1, j = 1$), (i) gives $0 + u_4 + 0 + u_1 - 4u_3 = -1$

$$\text{i.e., } u_1 - 4u_3 + u_4 = -1 \dots (iv)$$

For u_4 ($i = 2, j = 1$), gives $u_3 + 100 + u_2 - 4u_4 = -2$

$$u_2 + u_3 - 4u_4 = -102 \dots (v)$$

Subtracting (v) from (ii), $-4u_1 + 4u_4 = 0$ i.e. $u_1 = u_4$

Then (iv) becomes $2u_1 - 4u_2 = -204 \dots (vi)$

and (iv) becomes $2u_1 - 4u_3 = -1 \dots (vii)$

Now (4) \times (ii) + (vi) gives $-14u_1 + 4u_3 = -612 \dots (viii)$

(vii) + (viii) gives $-12u_1 = -613$

$$\text{Thus } u_1 = 613/12 = 51.0833 = u_4.$$

$$\text{From (vi), } u_2 = \frac{1}{2}(u_1 + 102) = 76.5477$$

$$\text{From (vii), } u_3 = \frac{1}{2}\left(u_1 + \frac{1}{2}\right) = 25.7916.$$

Example 33.6. Solve the partial differential equation $\nabla^2 u = -10(x^2 + y^2 + 10)$ over the square with sides $x = 0 = y$, $x = 3 = y$ with $u = 0$ on the boundary and mesh length = 1.

(Anna, 2007; P.T.U., 2007; Delhi, 2002)

Solution. Here $h = 1$ (Fig. 33.10).

\therefore The standard 5-point formula for the given equation is

$$u_{i-1,j} + u_{i+1,j} + u_{i,j+1} + u_{i,j-1} - 4u_{i,j} = -10(i^2 + j^2 + 10) \dots (i)$$

For u_1 ($i = 1, j = 2$), (i) gives

$$0 + u_2 + 0 + u_3 - 4u_1 = -10(1 + 4 + 10)$$

$$\text{i.e., } u_1 = \frac{1}{4}(u_2 + u_3 + 150) \dots (ii)$$

$$\text{For } u_2 \text{ } (i = 2, j = 2), \text{ (i) gives } u_2 = \frac{1}{4}(u_1 + u_4 + 180) \dots (iii)$$

$$\text{For } u_3 \text{ } (i = 1, j = 1), \text{ we have } u_3 = \frac{1}{4}(u_1 + u_4 + 120) \dots (iv)$$

$$\text{For } u_4 \text{ } (i = 2, j = 1), \text{ we have } u_4 = \frac{1}{4}(u_2 + u_3 + 150) \dots (v)$$

Equations (ii) and (v) show that $u_4 = u_1$. Thus the above equations reduce to

$$u_1 = \frac{1}{4}(u_2 + u_3 + 150) \dots (vi)$$

$$u_2 = \frac{1}{2}(u_1 + 90) \dots (vii)$$

$$u_3 = \frac{1}{2}(u_1 + 60) \dots (viii)$$

Now let us solve these equations by Gauss-Seidal iteration method.

First iteration : Starting from the approximations $u_2 = 0$, $u_3 = 0$, we obtain

$$u_1^{(1)} = 37.5. \text{ Then } u_2^{(1)} = \frac{1}{2}(37.5 + 90) = 64; u_3^{(1)} = \frac{1}{2}(37.5 + 60) = 49$$

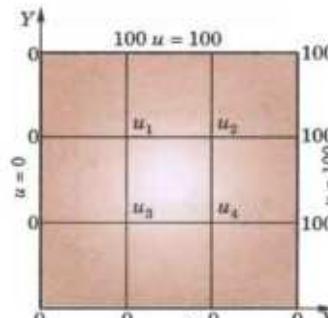

Fig. 33.9

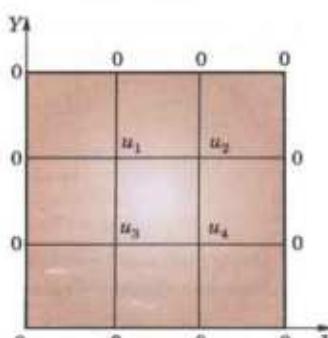

Fig. 33.10

Second iteration :

$$u_1^{(2)} = \frac{1}{4} (64 + 49 + 150) = 66; u_2^{(2)} = \frac{1}{2} (66 + 90) = 78; u_3^{(2)} = \frac{1}{2} (66 + 60) = 63$$

Third iteration :

$$u_1^{(3)} = \frac{1}{4} (78 + 63 + 150) = 73; u_2^{(3)} = \frac{1}{2} (73 + 90) = 82; u_3^{(3)} = \frac{1}{2} (73 + 60) = 67$$

Fourth iteration :

$$u_1^{(4)} = \frac{1}{4} (82 + 67 + 150) = 75; u_2^{(4)} = \frac{1}{2} (75 + 90) = 82.5; u_3^{(4)} = \frac{1}{2} (75 + 60) = 67.5$$

Fifth iteration :

$$u_1^{(5)} = \frac{1}{4} (82.5 + 67.5 + 150) = 75; u_2^{(5)} = \frac{1}{2} (75 + 90) = 82.5; u_3^{(5)} = \frac{1}{2} (75 + 60) = 67.5$$

Since these values are the same as those of fourth iteration, we have

$$u_1 = 75, u_2 = 82.5, u_3 = 67.5 \text{ and } u_4 = 75.$$

PROBLEMS 33.2

- Solve the equation $u_{xx} + u_{yy} = 0$ for the following square mesh with boundary values as shown in Fig. 33.11. Iterate until the maximum difference between the successive values at any point is less than 0.001. (Delhi, 2002)
- Solve $\nabla^2 u = 0$ under the conditions ($h = 1, k = 1$), $u(0, y) = 0$, $u(4, y) = 12 + y$ for $0 \leq y \leq 4$; $u(x, 0) = 3x$, $u(x, 4) = x^2$ for $0 \leq x \leq 4$. (CUSAT, 2008)
- Solve the elliptic equation $u_{xx} + u_{yy} = 0$ for the square mesh with boundary values as shown in Fig. 33.12. Iterate until the maximum difference between successive values at any point is less than 0.005.

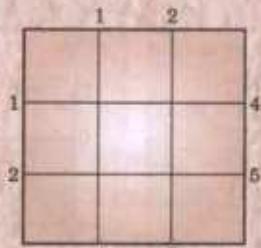

Fig. 33.11

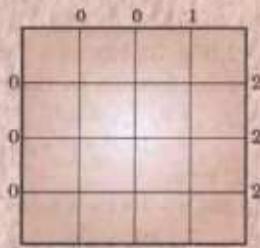

Fig. 33.12

- Using central-difference approximation solve $\nabla^2 u = 0$ at the nodal points of the square grid of Fig. 33.13 using the boundary values indicated. (V.T.U., 2000)

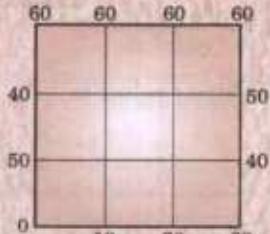

Fig. 33.13

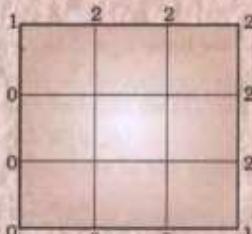

Fig. 33.14

- Solve $u_{xx} + u_{yy} = 0$ for the square mesh with boundary values as shown in Fig. 33.14. Iterate till the mesh values are correct to two decimal places.

6. Solve the Laplace's equation $u_{xx} + u_{yy} = 0$ in the domain of Fig. 33.15.

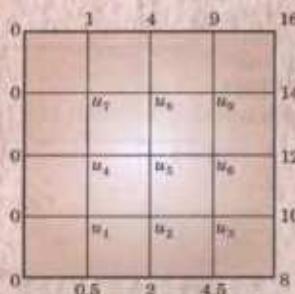

Fig. 33.15

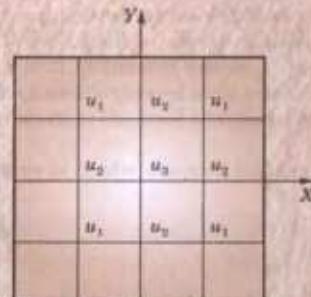

Fig. 33.16

7. Solve the Poisson's equation $\nabla^2 u = 8x^2y^2$ for the square mesh of Fig. 33.16 with $u(x, y) = 0$ on the boundary and mesh length = 1. (J.N.T.U., 2004 S)

Note. Solution of elliptic equations by *Relaxation method* is given in author's book "Numerical Methods in Engineering and Science".

33.7 PARABOLIC EQUATIONS

The one-dimensional heat conduction equation

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$$

is a well-known example of parabolic partial differential equations. The solution of this equation is a temperature function $u(x, t)$ which is defined for values of x from 0 to l and for values of time t from 0 to ∞ . The solution is not defined in a closed domain but advances in an open-ended region from initial values, satisfying the prescribed boundary conditions. (Fig. 33.17).

In general, the study of pressure waves in a fluid, propagation of heat and unsteady state problems lead to parabolic type of equations.

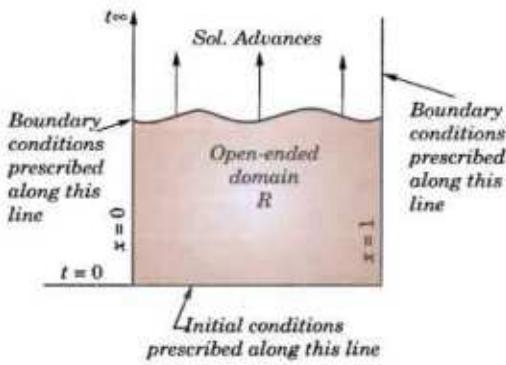

Fig. 33.17

33.8 SOLUTION OF HEAT EQUATION

$$\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2} \quad \dots(1)$$

where $c^2 = k/s\rho$ is the diffusivity of the substance ($\text{cm}^2/\text{sec.}$)

Consider a rectangular mesh in the $x-t$ plane with spacing h along x direction and k along time t direction. Denoting a mesh point $(x, t) = (ih, jk)$ as simply i, j , we have

$$\frac{\partial u}{\partial t} = \frac{u_{i,j+1} - u_{i,j}}{k} \quad [\text{By (5) } \& 33.3]$$

$$\frac{\partial^2 u}{\partial x^2} = \frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{h^2} \quad [\text{By (4) } \& 33.3]$$

and

Substituting these in (1), we obtain

$$u_{i,j+1} - u_{i,j} = \frac{kc^2}{h^2} [u_{i-1,j} - 2u_{i,j} + u_{i+1,j}]$$

or $u_{i,j+1} = \alpha u_{i-1,j} + (1 - 2\alpha) u_{i,j} + \alpha u_{i+1,j}$... (2)

where $\alpha = kc^2/h^2$ is the mesh ratio parameter.

This formula enables us to determine the value of u at the $(i, j+1)$ th mesh point in terms of the known function values at the points x_{i-1} , x_i and x_{i+1} at the instant t_j . It is a relation between the function values at the two time levels $j+1$ and j and is therefore, called a *2-level formula*. In schematic form (2) is shown in Fig. 33.18 which is

called the *Schmidt explicit formula* which is valid only for $0 < \alpha \leq \frac{1}{2}$.

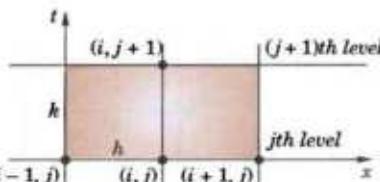

Fig. 33.18

Obs. In particular when $\alpha = \frac{1}{2}$, (2) reduces to

$$u_{i,j+1} = \frac{1}{2}(u_{i-1,j} + u_{i+1,j}) \quad \dots (3)$$

which shows that the value of u at x_i at time t_{j+1} is the mean of the u -values at x_{i-1} and x_{i+1} at time t_j . This relation, known as *Bendre-Schmidt recurrence relation*, gives the values of u at the internal mesh points with the help of boundary conditions.

Note. The other formulae (i.e., Crank-Nicolson formula and Du Fort-Frankel formula) are given in author's book 'Numerical Methods in Engineering and Science'.

Example 33.7. Solve $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial^2 x^2}$ in $0 < x < 5$, $t \geq 0$ given that $u(x, 0) = 20$, $u(0, t) = 0$, $u(5, t) = 100$. Compute u for the time-step with $h = 1$ by Crank-Nicholson method. (Anna, 2006)

Solution. Here $c^2 = 1$ and $h = 1$.

Taking α (i.e., $c^2 k/h = 1$) we get $k = 1$

Also we have

$i \backslash j$	0	1	2	3	4	5
0	0	20	20	20	20	100
1	0	u_1	u_2	u_3	u_4	100

Then Crank-Nicholson formula becomes

$$4u_{i,j+1} = u_{i-1,j+1} + u_{i+1,j+1} + u_{i-1,j} + u_{i+1,j} \quad \dots (1)$$

$$4u_1 = 0 + 20 + 0 + u_2 \quad \text{i.e.} \quad 4u_1 - u_2 = 20 \quad \dots (2)$$

$$4u_2 = 20 + 20 + u_1 + u_3 \quad \text{i.e.} \quad 4u_1 - 4u_2 + u_3 = -40 \quad \dots (3)$$

$$4u_3 = 20 + 20 + u_2 + u_4 \quad \text{i.e.} \quad u_2 - 4u_3 + u_4 = -40 \quad \dots (4)$$

$$4u_4 = 20 + 100 + u_3 + 100 \quad \text{i.e.} \quad 4u_3 - 4u_4 = -220 \quad \dots (5)$$

$$\text{Now (1) } - 4(\text{(2)} \text{ gives } 15u_2 - 4u_3 = 180 \quad \dots (5)$$

$$4(\text{(3)} + \text{(4)} \text{ gives } 4u_2 - 15u_3 = -380 \quad \dots (6)$$

$$\text{Then } 15(\text{(5)} - 4(\text{(6)} \text{ gives } 209u_2 = 4220 \quad \text{i.e.} \quad u_2 = 20.2$$

$$\text{From (5), we get } 4u_3 = 15 \times 20.2 - 180 \quad \text{i.e.} \quad u_3 = 30.75$$

$$\text{From (1),} \quad 4u_1 = 20 + 20.2 \quad \text{i.e.} \quad u_1 = 10.05$$

$$\text{From (4),} \quad 4u_4 = 220 + 30.75 \quad \text{i.e.} \quad u_4 = 62.69$$

Thus the required values are 10.05, 20.2, 30.75 and 62.69.

Example 33.8. Solve the boundary value problem $u_t = u_{xx}$ under the conditions $u(0, t) = u(1, t) = 0$ and $u(x, 0) = \sin \pi x$, $0 \leq x \leq 1$ using Schmidt method (Take $h = 0.2$ and $\alpha = 1/2$). (Rohtak, 2003)

Solution. Since $h = 0.2$ and $\alpha = 1/2$

$$\therefore \alpha = \frac{k}{h^2} \text{ gives } k = 0.02$$

Since $\alpha = 1/2$, we use Bredre-Schmidt relation

$$u_{i,j+1} = \frac{1}{2} (u_{i-1,j} + u_{i+1,j}) \quad \dots(i)$$

We have

$$\begin{aligned} u(0, 0) &= 0, u(0.2, 0) = \sin \pi/5 = 0.5875 \\ u(0.4, 0) &= \sin 2\pi/5 = 0.95111, u(0.6, 0) = \sin 3\pi/5 = 0.9511 \\ u(0.8, 0) &= \sin 4\pi/5 = 0.5875, u(1, 0) = \sin \pi = 0 \end{aligned}$$

The value of u at the mesh points can be obtained by using the recurrence relation (i) as shown in table below :

		$x \rightarrow 0$	0.2	0.4	0.6	0.8	1.0
$t \downarrow$	$j \backslash i$	0	1	2	3	4	5
0	0	0	0.5878	0.9511	0.9511	0.5878	0
0.02	1	0	0.4756	0.7695	0.7695	0.4756	0
0.04	2	0	0.3848	0.6225	0.6225	0.3848	0
0.06	3	0	0.3113	0.5036	0.5036	0.3113	0
0.08	4	0	0.2518	0.4074	0.4074	0.2518	0
0.1	5	0	0.2037	0.3296	0.3296	0.2037	0

Example 33.9. Find the values of $u(x, t)$ satisfying the parabolic equation $\frac{\partial u}{\partial t} = 4 \frac{\partial^2 u}{\partial x^2}$ and the boundary conditions $u(0, t) = 0 = u(8, t)$ and $u(x, 0) = 4x - \frac{1}{2}x^2$ at the points $x = i : i = 0, 1, 2, \dots, 8$ and $t = \frac{1}{8}j : j = 0, 1, 2, \dots, 5$.

Solution. Here $c^2 = 4$, $h = 1$ and $k = 1/8$. Then $\alpha = c^2k/h^2 = 1/2$.

\therefore we have Bredre-Schmidt's recurrence relation

$$u_{i,j+1} = \frac{1}{2} (u_{i-1,j} + u_{i+1,j}) \quad \dots(i)$$

Now since $u(0, t) = 0 = u(8, t)$

$\therefore u_{0,i} = 0$ and $u_{8,j} = 0$ for all values of j , i.e., the entries in the first and last column are zero.

Since $u(x, 0) = 4x - \frac{1}{2}x^2$

$$u_{i,0} = 4i - \frac{1}{2}i^2 = 0, 3.5, 6, 7.5, 8, 7.5, 6, 3.5$$

$i = 0, 1, 2, 3, 4, 5, 6, 7$ at $t = 0$

These are the entries of the first row.

		0	1	2	3	4	5	6	7	8
$j \downarrow$	$i \backslash j$	0	1	2	3	4	5	6	7	8
0	0	0	3.5	6	7.5	8	7.5	6	3.5	0
1	0	0	3	5.5	7	7.5	7	5.5	3	0
2	0	2.75	5	6.5	7	6.5	5	2.75	0	
3	0	2.5	4.625	6	6.5	6	4.625	2.5	0	
4	0	2.3125	4.25	5.5625	6	5.5625	4.25	2.3125	0	
5	0	2.125	3.9375	5.125	5.5625	5.125	3.9375	2.125	0	

Putting $j = 0$ in (i), we have

$$u_{i,1} = \frac{1}{2}(u_{i-1,0} + u_{i+1,0})$$

Taking $i = 1, 2, \dots, 7$ successively, we get

$$u_{1,1} = \frac{1}{2}(u_{0,0} + u_{2,0}) = \frac{1}{2}(0 + 6) = 3$$

$$u_{2,1} = \frac{1}{2}(u_{1,0} + u_{3,0}) = \frac{1}{2}(3.5 + 7.5) = 5.5$$

$$u_{3,1} = \frac{1}{2}(u_{2,0} + u_{4,0}) = \frac{1}{2}(6 + 8) = 7$$

$$u_{4,1} = 7.5, u_{5,1} = 7, u_{6,1} = 5.5, u_{7,1} = 3.$$

These are the entries in the second row.

Putting $j = 1$ in (i), the entries of the third row are given by

$$u_{i,2} = \frac{1}{2}(u_{i-1,1} + u_{i+1,1})$$

Similarly putting $j = 2, 3, 4$ successively in (i), the entries of the fourth, fifth and sixth rows are obtained. Hence the values of $u_{i,j}$ are as given in the above table.

Example 33.10. Solve the equation

$$\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$$

subject to the conditions $u(x, 0) = \sin \pi x, 0 \leq x \leq 1; u(0, t) = u(1, t) = 0$. Carry out computations for two levels, taking $h = 1/3, k = 1/36$. (V.T.U., 2005)

Solution. Here $c^2 = 1, h = 1/3, k = 1/36$ so that

$$\alpha = kc^2/h^2 = 1/4.$$

Also $u_{1,0} = \sin \pi/3 = \sqrt{3}/2, u_{2,0} = \sin 2\pi/3 = \sqrt{3}/2$

and all other boundary values are zero as shown in Fig. 33.19.

Schmidt's formula [(2) of § 33.8]

$$u_{i,j+1} = \alpha u_{i-1,j} + (1 - 2\alpha) u_{i,j} + \alpha u_{i+1,j}$$

becomes $u_{i,j+1} = \frac{1}{4}[u_{i-1,j} + 2u_{i,j} + u_{i+1,j}]$

For $i = 1, 2; j = 0$:

$$u_{1,1} = \frac{1}{4}[u_{0,0} + 2u_{1,0} + u_{2,0}] = \frac{1}{4}(0 + 2 \times \sqrt{3}/2 + \sqrt{3}/2) = 0.65$$

$$u_{2,1} = \frac{1}{4}[u_{1,0} + 2u_{2,0} + u_{3,0}] = \frac{1}{4}(\sqrt{3}/2 + 2 \times \sqrt{3}/2 + 0) = 0.65$$

For $i = 1, 2, j = 1$:

$$u_{1,2} = \frac{1}{4}(u_{0,1} + 2u_{1,1} + u_{2,1}) = 0.49$$

$$u_{2,2} = \frac{1}{4}(u_{1,1} + 2u_{2,1} + u_{3,1}) = 0.49.$$

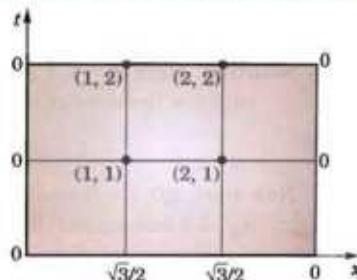

Fig. 33.19

PROBLEMS 33.3

- Find the solution of the parabolic equation $u_{xx} = 2u_t$ when $u(0, t) = u(4, t) = 0$ and $u(x, 0) = x(4-x)$, taking $h = 1$. Find the values upto $t = 5$. (Madras, 2001)
- Solve the equation $\frac{\partial^2 u}{\partial x^2} = \frac{\partial u}{\partial t}$ with the conditions $u(0, t) = 0, u(x, 0) = x(1-x)$ and $u(1, t) = 0$. Assume $h = 0.1$. Tabulate u for $t = k, 2k$ and $3k$ choosing an appropriate value of k . (Anna, 2001)

3. Given $\frac{\partial^2 f}{\partial x^2} - \frac{\partial f}{\partial t} = 0$; $f(0, t) = f(5, t) = 0$, $f(x, 0) = x^2(25 - x^2)$; find the values of f for $x = ih$ ($i = 0, 1, \dots, 5$) and $t = jk$ ($j = 0, 1, \dots, 6$) with $h = 1$ and $k = \frac{1}{2}$, using the explicit method.

4. Solve the heat equation $\frac{\partial u}{\partial t} = \frac{\partial^2 u}{\partial x^2}$ subject to the conditions $u(0, t) = u(1, t) = 0$ and

$$u(x, 0) = 2x \text{ for } 0 \leq x \leq \frac{1}{2}$$

$$= 2(1 - x) \text{ for } \frac{1}{2} \leq x \leq 1.$$

Take $h = 1/4$ and k according to Bredre-Schmidt equation.

33.9 HYPERBOLIC EQUATIONS

The wave equation : $\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2}$ is the simplest example of hyperbolic partial differential equations. Its

solution is the displacement function $u(x, t)$ defined for values of x from 0 to l and for t from 0 to ∞ , satisfying the initial and boundary conditions. The solution as for parabolic equations, advances in an open-ended region (Fig. 33.17). In the case of hyperbolic equations however, we have two initial conditions and two boundary conditions.

Such equations arise from convective type of problems in vibrations, wave mechanics and gas dynamics.

33.10 SOLUTION OF WAVE EQUATION

$$\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2} \quad \dots(1)$$

subject to the initial conditions : $u = f(x)$, $\frac{\partial u}{\partial t} = g(x)$, $0 \leq x \leq 1$ at $t = 0$ $\dots(2)$

and the boundary conditions : $u(0, t) = \phi(t)$, $u(1, t) = \psi(t)$. $\dots(3)$

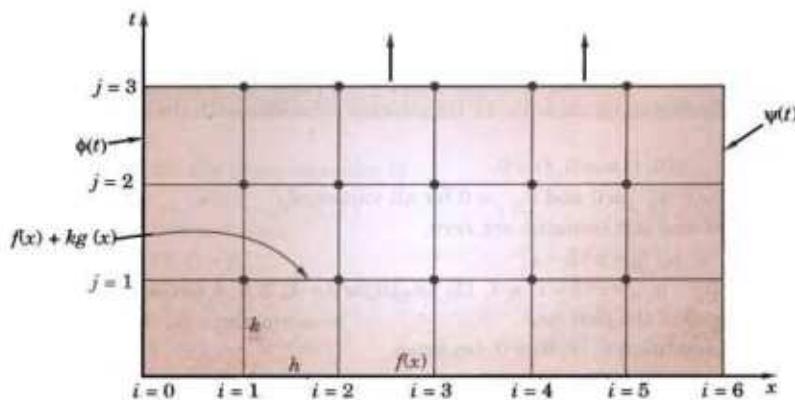

Fig. 33.20

Consider a rectangular mesh in the x - t plane spacing h along x direction and k along time t direction. Denoting a mesh point $(x, t) = (ih, jk)$ as simply i, j , we have

$$\frac{\partial^2 u}{\partial x^2} = \frac{u_{i-1,j} - 2u_{i,j} + u_{i+1,j}}{h^2} \quad \text{and} \quad \frac{\partial^2 u}{\partial t^2} = \frac{u_{i,j-1} - 2u_{i,j} + u_{i,j+1}}{k^2}$$

Replacing the derivatives in (1) by their above approximations, we obtain

$$\begin{aligned} u_{i,j+1} - 2u_{i,j} + u_{i,j-1} &= \frac{c^2 k^2}{h^2} (u_{i-1,j} - 2u_{i,j} + u_{i,j+1}) \\ \text{or } u_{i,j+1} &= 2(1 - \alpha^2 c^2) u_{i,j} + \alpha^2 c^2 (u_{i-1,j} + u_{i+1,j} - u_{i,j-1}) \end{aligned} \quad \dots(4)$$

where $\alpha = k/h$.

Now replacing the derivative in (2) by its central difference approximation, we get

$$\frac{u_{i,j+1} - u_{i,j-1}}{2k} = \frac{\partial u}{\partial t} = g(x) \quad [\text{See (7) p. 1042}]$$

or

$$u_{i,j+1} = u_{i,j-1} + 2k g(x) \quad \text{at } t = 0 \quad i.e. u_{i,1} = u_{i,-1} + 2kg(x) \text{ for } j = 0 \quad \dots(5)$$

$$\text{Also initial condition } u = f(x) \text{ at } t = 0 \text{ becomes } u_{i,0} = f(x) \quad \dots(6)$$

$$\text{Combining (5) and (6), we have } u_{i,1} = f(x) + 2kg(x) \quad \dots(7)$$

$$\text{Also (3) gives } u_{0,j} = \phi(t) \text{ and } u_{1,j} = \psi(t)$$

Hence (4) gives the values of $u_{i,j+1}$ at the $(j+1)$ th level when the nodal values at $(j-1)$ th and j th levels are known from (6) and (7) as shown in Fig. 32.20. Thus (4) gives an **implicit scheme for the solution of the wave equation**.

A special case : The coefficient of $u_{i,j}$ in (4) will vanish if $\alpha = 1/c$ or $k = h/c$. Then (4) reduces to the *simple form*

$$u_{i,j+1} = u_{i-1,j} + u_{i+1,j} - u_{i,j-1} \quad \dots(8)$$

This result provides an **explicit scheme for the solution of the wave equation**.

Obs. 1. For $\alpha = 1/c$, the solution of (4) is stable and coincides with the solution of (1).

For $\alpha < 1/c$, the solution is stable but inaccurate.

For $\alpha > 1/c$, the solution is unstable.

Obs. 2. The formula (4) converges for $\alpha \leq 1$ i.e. for $k \leq h$.

Example 33.11. Evaluate the pivotal values of the equation $u_{tt} = 16u_{xx}$, taking $h = 1$ upto $t = 1.25$. The boundary conditions are $u(0, t) = u(5, t) = 0$, $u_x(x, 0) = 0$ and $u(x, 0) = x^2(5-x)$. (Madras, 2006)

Solution. Here $c^2 = 16$.

∴ The difference equation for the given equation is

$$u_{i,j+1} = 2(1 - 16\alpha^2) u_{i,j} + 16\alpha^2 (u_{i-1,j} + u_{i+1,j}) - u_{i,j-1} \quad \text{where } \alpha = k/h \quad \dots(i)$$

Taking $h = 1$ and choosing k so that the coefficient of $u_{i,j}$ vanishes, we have $16\alpha^2 = 1$, i.e., $k = h/4 = 1/4$.

$$\therefore (i) \text{ reduces to } u_{i,j+1} = u_{i-1,j} + u_{i+1,j} - u_{i,j-1} \quad \dots(ii)$$

which gives a convergent solution (since $k/h < 1$). Its solution coincides with the solution of the given differential equation.

Now since $u(0, t) = u(5, t) = 0$.

$$\therefore u_{0,j} = 0 \text{ and } u_{5,j} = 0 \text{ for all values of } j$$

i.e. the entries in the first and last columns are zero.

Since $u_{(x,0)} = x^2(5-x)$

$$\therefore u_{i,0} = i^2(5-i) = 4, 12, 18, 16 \text{ for } i = 1, 2, 3, 4 \text{ at } t = 0.$$

These are the entries of the *first row*.

Finally the initial condition $u_t(x, 0) = 0$, becomes

$$\frac{u_{i,j+1} - u_{i,j-1}}{2k} = 0, \text{ when } j = 0, \text{ giving } u_{i,1} = u_{i,-1} \quad \dots(iii)$$

$$\begin{aligned} \text{Putting } j = 0 \text{ in (ii), } u_{i,1} &= u_{i-1,0} + u_{i+1,0} - u_{i,-1} \\ &= u_{i-1,0} + u_{i+1,0} - u_{i,1} \text{ using (iii)} \end{aligned}$$

$$\text{or } u_{i,1} = \frac{1}{2} (u_{i-1,0} + u_{i+1,0}) \quad \dots(iv)$$

Taking $i = 1, 2, 3, 4$ successively, we obtain

$$u_{1,1} = \frac{1}{2} (u_{0,0} + u_{2,0}) = \frac{1}{2} (0 + 12) = 6$$

$$u_{2,1} = \frac{1}{2} (u_{1,0} + u_{3,0}) = \frac{1}{2} (4 + 18) = 11$$

$$u_{3,1} = \frac{1}{2} (u_{2,0} + u_{4,0}) = \frac{1}{2} (12 + 16) = 14$$

$$u_{4,1} = \frac{1}{2} (u_{3,0} + u_{5,0}) = \frac{1}{2} (18 + 0) = 9$$

These are the entries of the *second row*.

Putting $j = 1$ in (ii), we get

$$u_{i,2} = u_{i-1,1} + u_{i+1,1} - u_{i,0}$$

Taking $i = 1, 2, 3, 4$ successively, we obtain

$$u_{1,2} = u_{0,1} + u_{2,1} - u_{1,0} = 0 + 11 - 4 = 7$$

$$u_{2,2} = u_{1,1} + u_{3,1} - u_{2,0} = 6 + 14 - 12 = 8$$

$$u_{3,2} = u_{2,1} + u_{4,1} - u_{3,0} = 11 + 9 - 18 = 2$$

$$u_{4,2} = u_{3,1} + u_{5,1} - u_{4,0} = 14 + 0 - 16 = -2$$

These are the entries of the *third row*.

Similarly putting $j = 2, 3, 4$ successively in (ii), the entries of the fourth, fifth and sixth rows are obtained.

Hence the values of $u_{i,j}$ are as shown in the table below :

$j \backslash i$	0	1	2	3	4	5
0	0	4	12	18	16	0
1	0	6	11	14	9	0
2	0	7	8	2	-2	0
3	0	2	-2	-8	-7	0
4	0	-9	-14	-11	-6	0
5	0	-16	-18	-12	-4	0

Example 33.12. The transverse displacement u of a point at a distance x from one end and at any time t of a vibrating string satisfies the equation $\partial^2 u / \partial t^2 = 4 \partial^2 u / \partial x^2$, with boundary conditions $u = 0$ at $x = 0, t > 0$ and $u = 0$ at $x = 4, t > 0$ and initial conditions $u = x(4-x)$ and $\partial u / \partial t = 0$ at $t = 0, 0 \leq x \leq 4$. Solve this equation numerically for one half period of vibration, taking $h = 1$ and $k = 1/2$.

Solution. Here, $h/k = 2 = c$.

∴ the difference equation for the given equation is

$$u_{i,j+1} = u_{i-1,j} + u_{i+1,j} - u_{i,j-1} \quad \dots(i)$$

which gives a convergent solution (since $k < h$).

Now since $u(0, t) = u(4, t) = 0$,

∴ $u_{0,j} = 0$ and $u_{4,j} = 0$ for all values of j .

i.e., the entries in the first and last columns are zero.

Since $u_{(x,0)} = x(4-x)$,

∴ $u_{i,0} = i(4-i) = 3, 4, 3$ for $i = 1, 2, 3$ at $t = 0$.

These are the entries of the *first row*.

Also $u_t(x, 0) = 0$ becomes

$$\frac{u_{i,j+1} - u_{i,j-1}}{2k} = 0 \text{ when } j = 0, \text{ giving } u_{i,1} = u_{i,-1} \quad \dots(ii)$$

Putting $j = 0$ in (i), $u_{i,1} = u_{i-1,0} + u_{i+1,0} - u_{i,-1}$
 $= u_{i-1,0} + u_{i+1,0} - u_{i,1}$, using (ii)

$$\text{or } u_{i,1} = \frac{1}{2} (u_{i-1,0} + u_{i+1,0}) \quad \dots(iii)$$

Taking $i = 1, 2, 3$ successively, we obtain

$$\begin{aligned} u_{1,1} &= \frac{1}{2}(u_{0,0} + u_{1,0}) = 2; u_{2,1} = \frac{1}{2}(u_{1,0} + u_{3,0}) = 3 \\ u_{3,1} &= \frac{1}{2}(u_{2,0} + u_{4,0}) = 2 \end{aligned}$$

These are the entries of the 2nd row.

Putting $j = 1$ in (i), $u_{i,2} = u_{i-1,1} + u_{i+1,1} - u_{i,0}$

Taking $i = 1, 2, 3$, successively, we get

$$\begin{aligned} u_{1,2} &= u_{0,1} + u_{2,1} - u_{1,0} = 0 + 3 - 3 = 0 \\ u_{2,2} &= u_{1,1} + u_{3,1} - u_{2,0} = 2 + 2 - 4 = 0 \\ u_{3,2} &= u_{2,1} + u_{4,1} - u_{3,0} = 3 + 0 - 3 = 0 \end{aligned}$$

These are the entries of the 3rd row and so on.

Now the equation of the vibrating string of length l is $u_{tt} = c^2 u_{xx}$.

$$\therefore \text{Its period of vibration} = \frac{2l}{c} = \frac{2 \times 4}{2} = 4 \text{ sec.} \quad [\because l = 4 \text{ and } c = 2]$$

This shows that we have to compute $u_{(x,t)}$ upto $t = 2$.

i.e., similarly we obtain the values of $u_{i,2}$ (4th row) and $u_{i,3}$ (5th row).

Hence the values of $u_{i,j}$ are as shown in the table below :

j	i	0	1	2	3	4
0	0	0	3	4	3	0
1	0	0	2	3	2	0
2	0	0	0	0	0	0
3	0	0	-2	-3	-2	0
4	0	0	-3	-4	-3	0

Example 33.13. Find the solution of the initial boundary value problem ; $\frac{\partial^2 u}{\partial t^2} = \frac{\partial^2 u}{\partial x^2}$, $0 \leq x \leq 1$; subject to

the initial conditions $u(x, 0) = \sin \pi x$, $0 \leq x \leq 1$ and the boundary conditions $u(0, t) = 0$, $u(1, t) = 0$, $t > 0$; by using in the (a) the explicit scheme,

(b) the implicit scheme.

(Anna, 2007)

Solution. (a) Explicit scheme

$$\text{Take } h = 0.2, k = \frac{h}{c} = 0.2$$

[$\because c = 1$]

\therefore We use the formula, $u_{i,j+1} = u_{i-1,j} + u_{i+1,j} - u_{i,j-1}$... (i)

Since $u(0, t) = 0$, $u(1, t) = 0$, $u_{0,j} = 0$, $u_{1,j} = 0$ for all values of j

i.e., the entries in the first and last columns are zero.

Since $u(x, 0) = \sin \pi x$, $u_{i,0} = \sin \pi x$

$$\therefore u_{1,0} = 0, u_{2,0} = \sin(0.2\pi) = 0.5878, u_{3,0} = \sin(0.4\pi) = 0.9511, u_{4,0} = \sin(0.6\pi) = 0.5878.$$

These are the entries of the first row.

$$\text{Since } u_t(x, 0) = 0 \text{ we have } \frac{1}{2}(u_{i,j+1} - u_{i,j-1}) = 0, \text{ when } j = 0$$

... (ii)

i.e.,

$$\text{Putting } j = 0 \text{ in (i), } u_{i,1} = u_{i-1,0} + u_{i+1,0} - u_{i,-1}$$

$$\text{Using (ii)} \quad u_{i,1} = \frac{1}{2}(u_{i-1,0} + u_{i+1,0} - u_{i-1,0})$$

Taking $i = 1, 2, 3, 4$ successively, we obtain the entries of the second row.

Putting $j = 1$ in (i), $u_{i,2} = u_{i-1,1} + u_{i+1,1} - u_{i,0}$

Now taking $i = 1, 2, 3, 4$ successively, we get the entries of the third row.

Similarly taking $j = 2, j = 3, j = 4$ successively, we obtain the entries of the fourth, fifth and sixth rows respectively.

$j \backslash i$	0	1	2	3	4	5
0	0	0.5878	0.9511	0.9511	0.5878	0
1	0	0.4756	0.7695	0.9511	0.7695	0
2	0	0.1817	0.4756	0.5878	0.3632	0
3	0	0	0.0001	-0.1122	-0.1816	0
4	0	-0.1816	-0.5878	-0.7694	0.4755	0
5	0	-0.5878	-0.9511	-0.9511	-0.5878	0

(b) Implicit scheme

We have the formula :

$$u_{i,j+1} = 2(1 - \alpha^2 c^2) u_{i,j} + \alpha^2 c^2 (u_{i-1,j} + u_{i+1,j}) - u_{i,j-1}, \text{ where } \alpha = k/h \quad \dots(i)$$

Here $c^2 = 1$. Take $h = 0.25$ and $k = 0.5$ so that $\alpha = k/h = 2$.

$\therefore (i)$ reduces to

$$u_{i,j+1} = -6u_{i,j} + 4(u_{i-1,j} + u_{i+1,j}) - u_{i,j-1} \quad \dots(ii)$$

Since

$$u_{i,0} = \sin \pi x$$

$$\therefore u_{(1,0)} = 0.7071, u_{(2,0)} = 0.5, u_{(3,0)} = 0.7071$$

There are the entries of the first row.

$$\text{Since } u_i(x, 0) = 0, \text{ we have } \frac{1}{2}(y_{i,i+1} - y_{i,i-1}) = 0, \text{ where } j = 0$$

$$\therefore y_{i,1} = y_{i,-1} \quad \dots(iii)$$

Put $j = 0$ and using (iii), (ii) reduces to

$$u_{i,1} = -3u_{i,0} + 2(u_{i-1,0} + 2u_{i+1,0})$$

$$\text{Now taking } i = 1, u_{1,1} = -3u_{1,0} + 2(u_{0,0} + u_{2,0}) = 0.1213$$

$$i = 2, u_{2,1} = -3u_{2,0} + 2(u_{1,0} + u_{3,0}) = 0.1716$$

$$i = 3, u_{3,1} = -3u_{3,0} + 2(u_{2,0} + u_{4,0}) = 0.1213$$

These are the entries of the second row.

Putting $j = 1$, (ii) reduces to

$$u_{i,2} = -6u_{i,1} + 4(u_{i-1,2} + u_{i+1,1})$$

$$\text{Now taking } i = 1, u_{1,2} = -6u_{1,1} + 4(u_{0,1} + u_{2,1}) = 0.414$$

$$i = 2, u_{2,2} = -6u_{2,1} + 4(u_{1,1} + u_{3,1}) = 0.0592$$

$$i = 3, u_{3,2} = -6u_{3,1} + 4(u_{2,1} + u_{4,1}) = 0.414$$

These are the entries of the third row.

Putting $j = 2$, (ii) reduces to

$$u_{i,3} = -6u_{i,2} + 4(u_{i-1,3} + u_{i+1,2}) - u_{i,1}$$

$$\text{Now taking } i = 1, u_{1,3} = -6u_{1,2} + 4(u_{0,2} + u_{2,2}) - u_{1,1} = 0.1097$$

$$i = 2, u_{2,3} = -6u_{2,2} + 4(u_{1,2} + u_{3,2}) - u_{2,1} = 0.1476$$

$$i = 3, u_{3,3} = -6u_{3,2} + 4(u_{2,2} + u_{4,2}) - u_{4,1} = 0.1097$$

These are the entries of the third row.

Hence the value of $u_{i,j}$ are as tabulated below :

$j \backslash i$	0	1	2	3	4
0	0	0.7071	0.5	0.7071	0
1	0	-0.1213	-0.1716	-0.1213	0
2	0	0.0414	0.0592	0.0414	0

PROBLEMS 33.4

1. Solve the boundary value problem $u_{tt} = u_{xx}$ with the conditions $u(0, t) = u(1, t) = 0$, $u(x, 0) = \frac{1}{2}x(1-x)$ and $u_t(x, 0) = 0$, taking $h = k = 0.1$ for $0 \leq t \leq 0.4$. Compare your solution with the exact solution at $x = 0.5$ and $t = 0.2$.
 (V.T.U., 2000)
2. The transverse displacement u of a point at a distance x from one end and at any time t of a vibrating string satisfies the equation $\partial^2 u / \partial t^2 = 25 \partial^2 u / \partial x^2$, with the boundary conditions $u(0, t) = u(5, t) = 0$ and the initial conditions $u(x, 0) = \begin{cases} 20x & \text{for } 0 \leq x \leq 1 \\ 5(5-x) & \text{for } 1 \leq x \leq 5 \end{cases}$ and $u_t(x, 0) = 0$. Solve this equation numerically for one half period of vibration, taking $h = 1$, $k = 0.2$.
3. Solve $y_{tt} = y_{xx}$ upto $t = 0.5$ with a spacing of 0.1 subject to $y(0, t) = 0$, $y(1, t) = 0$, $y_t(x, 0) = 0$, and $y(x, 0) = 10 + x(1-x)$.
 (Anna, 2004)
4. The function u satisfies the equation

$$\partial^2 u / \partial t^2 = \partial^2 u / \partial x^2$$

and the conditions : $u(x, 0) = \frac{1}{8} \sin \pi x$, $u_t(x, 0) = 0$ for $0 \leq x \leq 1$,

$$u(0, t) = u(1, t) = 0 \text{ for } t \geq 0.$$

Use the explicit scheme to calculate u for $x = 0(0.1) 1$ and $t = 0(0.1) 0.5$.

33.11 OBJECTIVE TYPE OF QUESTIONS

PROBLEMS 33.5

Fill up the blanks or select the correct answer from each of the following questions :

1. Which of the following equations is parabolic :
 (a) $f_{xx} - f_x = 0$ (b) $f_{xx} + 2f_{xy} + f_{yy} = 0$ (c) $f_{xx} + 2f_{xy} + 4f_{yy} = 0$ (d) none
2. $u_{ij} = \frac{1}{4}(u_{i+1,j} - u_{i-1,j} + u_{i,j+1} - u_{i,j-1})$ is Leibmann's five point formula.
 (True or False)
3. $u_{xx} + 3u_{xy} + u_{yy} = 0$ is classified as
 4. $\nabla^2 u = f(x, y)$ is known as
5. The simplest formula to solve $u_{tt} = c^2 u_{xx}$ is
 6. The finite difference form of $\partial^2 u / \partial x^2$ is
7. Schmidt's finite difference scheme to solve $u_t = c^2 u_{xx}$ is
 8. The 5-point diagonal formula gives $u_{ij} =$
 9. The partial differential equation $(x+1)u_{xx} - 2(x+2)u_{xy} + (x+3)u_{yy} = 0$ is classified as
10. $u_{i,j+1} = \frac{1}{2}(u_{i+1,j} + u_{i-1,j})$ is called recurrence relation.
11. In terms of difference quotients $4u_{xx} = u_{tt}$ is
 12. Bende-Schmidt recurrence relation for one dimensional heat equation is
 13. The diagonal 5-point formula to solve the Laplace equation $u_{xx} + u_{yy} = 0$ is
 14. In the parabolic equation $u_t = c^2 u_{xx}$ if $\lambda = ka^2/h^2$, where $k = \Delta t$, and $h = \Delta x$, then explicit method is stable if $\lambda =$
 15. $2 \frac{\partial^2 u}{\partial t^2} + 4 \frac{\partial^2 u}{\partial x \partial y} + 3 \frac{\partial^2 u}{\partial x^2} = 0$ is classified as
 (P.T.U., 2007)
16. The boundary conditions of one-dimensional wave equation are
 17. The explicit formula for one-dimensional wave equation with $1 - \lambda^2 c^2 = 0$ and $\lambda = k/h$ is
 18. The general form of Poisson's equation in partial derivations is
 19. If u satisfies Laplace equation and $u = 100$ on the boundary of a square, the value of u at an interior grid point is
 20. The Laplace equation $u_{xx} + u_{yy} = 0$ in difference quotients is
 21. The equation $yu_{xx} + u_{yy} = 0$ is hyperbolic in the region
22. To solve $\frac{\partial u}{\partial t} = \frac{1}{2} \frac{\partial^2 u}{\partial x^2}$ by Bende-Schmidt method with $h = 1$, the value of k is

34.1 INTRODUCTION

Linear programming deals with the optimization (maximization or minimization) of linear functions subject to linear constraints. This technique has found its applications to important areas of product mix, blending problems and diet problems. Oil refineries, chemical industries, steel industries and food processing industry are also using linear programming with considerable success.

In this chapter, our purpose is to present the principles of linear programming and the techniques of its application in a manner that will suit the engineering students. Beginning with the graphical method which provides a great deal of insight into the basic concepts, the simplex method of solving linear programming problems is developed. Then the reader is introduced to the Duality concept. Finally a special class of linear programming problems namely : Transportation and Assignment problems, is taken up. For a detailed study, the student should refer to author's book '*Numerical Methods in Engineering and Science*'.

34.2 FORMULATION OF THE PROBLEM

To begin with, a problem is to be presented in a linear programming form which requires defining the variables involved, establishing relationships between them and formulating the objective function and the constraints. We illustrate this through a few examples.

Example 34.1. A manufacturer produces two types of models M_1 and M_2 . Each M_1 model requires 4 hours of grinding and 2 hours of polishing ; whereas each M_2 model requires 2 hours of grinding and 5 hours of polishing. The manufacturer has 2 grinders and 3 polishers. Each grinder works for 40 hours a week and each polisher works for 60 hours a week. Profit on an M_1 model is ₹ 3 and on an M_2 model is ₹ 4. Whatever is produced in a week is sold in the market. How should the manufacturer allocate his production capacity to the two types of models so that he may make the maximum profit in a week.

Solution. Let x_1 be the number of M_1 models and x_2 , the number of M_2 models produced per week. Then the weekly profit (in ₹) is

$$Z = 3x_1 + 4x_2 \quad \dots(i)$$

To produce these number of models, the total number of grinding hours needed per week

$$= 4x_1 + 2x_2$$

and the total number of polishing hours required per week

$$= 2x_1 + 5x_2$$

Since the number of grinding hours available is not more than 80 and the number of polishing hours is not more than 180, therefore,

$$4x_1 + 2x_2 \leq 80 \quad \dots(ii)$$

$$2x_1 + 5x_2 \leq 180 \quad \dots(iii)$$

Also since the negative number of models are not produced, obviously we must have

$$x_1 \geq 0 \text{ and } x_2 \geq 0 \quad \dots(iv)$$

Hence this allocation problem is, to find x_1, x_2 which

$$\text{maximize} \quad Z = 3x_1 + 4x_2$$

$$\text{subject to} \quad 4x_1 + 2x_2 \leq 80, 2x_1 + 5x_2 \leq 180, x_1, x_2 \geq 0.$$

Obs. The variables that enter into the problem are called **decision variables**.

The expression (i) showing the relationship between the manufacturer's goal and the decision variables, is called the **objective function**.

The inequalities (ii), (iii) and (iv) are called the **constraints**.

The objective function and the constraints being all linear, it is a **linear programming problem (L.P.P.)**. This is an example of a real situation from industry.

Example 34.2. A firm making castings uses electric furnace to melt iron with the following specifications :

	Minimum	Maximum
Carbon	3.20%	3.40%
Silicon	2.25%	2.35%

Specifications and costs of various raw materials used for this purpose are given below :

Material	Carbon %	Silicon %	Cost (₹)
Steel scrap	0.4	0.15	850 / tonne
Cast iron scrap	3.80	2.40	900 / tonne
Remelt from foundry	3.50	2.30	500 / tonne

If the total charge of iron metal required is 4 tonnes, find the weight in kg of each raw material that must be used in the optimal mix at minimum cost. (J.N.T.U., 1999 S)

Solution. Let x_1, x_2, x_3 be the amounts (in kg) of these raw materials. The objective is to minimize the cost i.e.,

$$\text{minimize} \quad Z = \frac{850}{1000} x_1 + \frac{900}{1000} x_2 + \frac{500}{1000} x_3 \quad \dots(i)$$

For iron melt to have a minimum of 3.2% carbon,

$$0.4x_1 + 3.8x_2 + 3.5x_3 \geq 3.2 \times 4,000 \quad \dots(ii)$$

For iron melt to have a maximum of 3.4% carbon,

$$0.4x_1 + 3.8x_2 + 3.5x_3 \leq 3.4 \times 4,000 \quad \dots(iii)$$

For iron melt to have a minimum of 2.25% silicon,

$$0.15x_1 + 2.41x_2 + 2.35x_3 \geq 2.25 \times 4,000 \quad \dots(iv)$$

For iron melt to have a maximum of 2.35% silicon,

$$0.15x_1 + 2.41x_2 + 2.35x_3 \leq 2.35 \times 4,000 \quad \dots(v)$$

Also, since the materials added up must be equal to the full charge weight of 4 tonnes.

$$\therefore x_1 + x_2 + x_3 = 4,000 \quad \dots(vi)$$

Finally since the amounts of raw material cannot be negative

$$x_1 \geq 0, x_2 \geq 0, x_3 \geq 0 \quad \dots(vii)$$

Thus the linear programming problem is to find x_1, x_2, x_3 which

$$\text{minimize} \quad Z = 0.85x_1 + 0.9x_2 + 0.5x_3$$

$$\text{subject to} \quad 0.4x_1 + 3.8x_2 + 3.5x_3 \geq 12,800$$

$$0.4x_1 + 3.8x_2 + 3.5x_3 \leq 13,600$$

$$\begin{aligned}0.15x_1 + 2.41x_2 + 2.35x_3 &\geq 9,000 \\0.15x_1 + 2.41x_2 + 2.35x_3 &\leq 9,400 \\x_1 + x_2 + x_3 &= 4,000 \\x_1, x_2, x_3 &\geq 0.\end{aligned}$$

PROBLEMS 34.1

1. A firm manufactures two items. It purchases castings which are then machined, bored and polished. Castings for items A and B cost ₹ 3 and ₹ 4 each and are sold at ₹ 6 and ₹ 7 each respectively. Running costs of these machines are ₹ 20, ₹ 14 and ₹ 17.50 per hour respectively. Formulate the problem so that the product mix maximizes the profit? Capacities of the machines are

	Part A	Part B
Machining capacity	25 per hr.	40 per hr.
Boring capacity	28 per hr.	35 per hr.
Polishing capacity	35 per hr.	25 per hr.

2. A firm manufactures 3 products A, B and C. The profits are ₹ 3, ₹ 2 and ₹ 4 respectively. The firm has two machines M_1 and M_2 and below is the required processing time in minutes for each machine on each product.

	Product		
	A	B	C
Machine	M_1	4	3
	M_2	2	2

Machines M_1 and M_2 have 2000 and 2500 machine-minutes respectively. The firm must manufacture 100 A's, 200 B's and 50 C's but not more than 150 A's. Set up an L.P.P. to maximize profit. (Kurukshetra, 2009 S)

3. Three products are processed through three different operations. The time (in minutes) required per unit of each product, the daily capacity of the operations (in minutes per day) and the profit per unit sold for each product (in rupees) are as follows:

Operation	Time per unit			Operation capacity
	Product I	Product II	Product III	
1	3	4	3	42
2	5	0	3	45
3	3	6	2	41
Profit (₹)	3	2	1	

The zero time indicates that the product does not require the given operation. The problem is to determine the optimum daily production for three products that maximize the profit. Formulate this production planning problem as a linear programming problem assuming that all units produced are sold.

4. An aeroplane can carry a maximum of 200 passengers. A profit of ₹ 400 is made on each first class ticket and a profit of ₹ 300 is made on each economy class ticket. The airline reserves at least 20 seats for first class. However, at least 4 times as many passengers prefer to travel by economy class than by the first class. How many tickets of each class must be sold in order to maximize profit for the airline? Formulate the problem as an L.P. model. (Rohtak, 2006)

5. A firm manufactures headache pills in two sizes A and B. Size A contains 2 grains of aspirin, 5 grains of bicarbonate and 1 grain of codeine. Size B contains 1 grain of aspirin, 8 grains of bicarbonate and 6 grains of codeine. It is found by users that it requires at least 12 grains of aspirin, 74 grains of bicarbonate and 24 grains of codeine for providing immediate effect. It is required to determine the least number of pills a patient should take to get immediate relief. Formulate the problem as a standard L.P.P.

6. Consider the following problem faced by a production planner in a soft-drink plant. He has two bottling machines A and B. A is designed for 8-ounce bottles and B for 16-ounce bottles. However, each can be used on both types with some loss of efficiency. The following data is available:

Machine	8-ounce bottles	16-ounce bottles
A	100/minute	40/minute
B	60/minute	75/minute

The machines can be run 8 hours per day, 5 days per week. Profit on a 8-ounce bottle is 15 paise and on a 16-ounce bottle is 25 paise. Weekly production of the drink cannot exceed 300,000 ounces and the market can absorb 25,000

8-ounce bottles and 7,000 16-ounce bottles per week. The planner wishes to maximise his profit subject, of course, to all the production and marketing restrictions. Formulate this as a L.P.P.

7. A dairy feed company may purchase and mix one or more of three types of grains containing different amounts of nutritional elements. The data is given in the table below. The production manager specifies that any feed mix for his live stock must meet at least minimum nutritional requirements and seeks the least costly among all three mixes.

Item	One unit weight of			Minimum requirement
	Grain 1	Grain 2	Grain 3	
<i>Nutritional ingredients</i>	A	2	3	7
	B	1	1	0
	C	5	3	0
	D	6	25	1
<i>Cost per weight of</i>	41	35	96	

Formulate the problem as a L.P. model.

8. A firm produces an alloy with the following specifications:

(i) specific gravity ≤ 0.97 ; (ii) chromium content $\geq 15\%$; (iii) melting temperature $\geq 494^{\circ}\text{C}$

The alloy requires three raw materials A, B and C whose properties are as follows:

Property	Properties of raw material		
	A	B	C
Sp. gravity	0.94	1.00	1.05
Chromium	10%	15%	17%
Melting pt.	470°C	500°C	520°C

Find the values of A, B, C to be used to make 1 tonne of alloy of desired properties, keeping the raw material costs at the minimum when they are ₹ 105/tonne for A, ₹ 245/tonne for B and ₹ 165/tonne for C. Formulate an L.P. model for the problem.

34.3 GRAPHICAL METHOD

Linear programming problems involving only two variables can be effectively solved by a graphical technique which provides a pictorial representation of the solution and one gets insight into the basic concepts used in solving large L.P.P.

Working procedure to solve a linear programming problem graphically:

Step 1. Formulate the given problem as a linear programming problem.

Step 2. Plot the given constraints as equalities on $x_1 - x_2$ coordinate plane and determine the convex region* formed by them.

Step 3. Determine the vertices of the convex region and find the value of the objective function at each vertex. The vertex which gives the optimal (maximum or minimum) value of the objective function gives the desired optimal solution to the problem.

Otherwise. Draw the dotted line through the origin representing the objective function with $Z = 0$. As Z is increased from zero, this line moves to the right remaining parallel to itself. We go on sliding this line (parallel to itself), till it is farthest away from the origin and passes through only one vertex of the convex region. This is the vertex where the maximum value of Z is attained.

* A region or a set of points is said to be **convex** if the line joining any two of its points lies completely in the region (or the set). Figs. 34.1 and 34.2 represent convex regions while Figs. 34.3 and 34.4 do not form convex sets.

Fig. 34.1

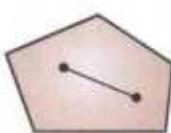

Fig. 34.2

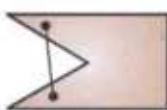

Fig. 34.3

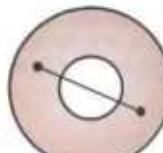

Fig. 34.4

When it is required to minimize Z , value of Z is increased till the dotted line passes through the nearest vertex of the convex region.

Example 34.3. Solve the L.P.P. of Ex. 34.1 graphically.

(V.T.U., 2003)

Solution. The problem is:

Maximize

$$Z = 3x_1 + 4x_2 \quad \dots(i)$$

subject to

$$4x_1 + 2x_2 \leq 80 \quad \dots(ii)$$

$$2x_1 + 5x_2 \leq 180 \quad \dots(iii)$$

$$x_1, x_2 \geq 0 \quad \dots(iv)$$

Consider $x_1 - x_2$ coordinate system as shown in Fig. 34.5. The non-negativity restrictions (iv) imply that the values of x_1, x_2 lie in the first quadrant only.

We plot the lines $4x_1 + 2x_2 = 80$ and $2x_1 + 5x_2 = 180$.

Then any point on or below $4x_1 + 2x_2 = 80$ satisfies (ii) and any point on or below $2x_1 + 5x_2 = 180$ satisfies (iii). This shows that the desired point (x_1, x_2) must be somewhere in the shaded convex region $OABC$. This region is called the *solution space* or *region of feasible solutions* for the given problem. Its vertices are $O(0, 0)$, $A(20, 0)$, $B(2.5, 35)$ and $C(0, 36)$.

The values of the objective function (i) at these points are

$$Z(O) = 0, Z(A) = 60, Z(B) = 147.5, Z(C) = 144.$$

Thus the maximum value of Z is 147.5 and it occurs at B . Hence the optimal solution to the problem is

$$x_1 = 2.5, x_2 = 35 \text{ and } Z_{\max} = 147.5.$$

Otherwise. Our aim is to find the point (or points) in the solution space which maximizes the profit function Z . To do this, we observe that on making $Z = 0$, (i) becomes $3x_1 + 4x_2 = 0$ which is represented by the dotted line LM through O . As the value of Z is increased, the line LM starts moving parallel to itself towards the right. Larger the value of Z , more will be the company's profit. In this way, we go on sliding LM till it is farthest away from the origin and passes through one of the corners of the convex region. This is the point where the maximum value of Z is attained. Just possible, such a line may be one of the edges of the solution space. In that case every point on that edge gives the same maximum value of Z .

Here Z_{\max} is attained at $B(2.5, 35)$. Hence the optimal solution is $x_1 = 2.5, x_2 = 35$ and $Z_{\max} = 147.5$.

Example 34.4. Find the maximum value of $Z = 2x + 3y$ subject to the constraints: $x + y \leq 30$, $y \geq 3$, $0 \leq y \leq 12$, $x - y \geq 0$, and $0 \leq x \leq 20$. (Rohtak, 2006)

Solution. Any point (x, y) satisfying the conditions $x \geq 0, y \geq 0$ lies in the first quadrant only. Also since $x + y \leq 30$, $y \geq 3$, $y \leq 12$, $x \geq y$ and $x \leq 20$, the desired point (x, y) lies within the convex region $ABCDE$ (shown shaded in Fig. 34.6). Its vertices are $A(3, 3)$, $B(20, 3)$, $C(20, 10)$, $D(18, 12)$, and $E(12, 12)$.

The values of Z at these five vertices are $Z(A) = 15$, $Z(B) = 49$, $Z(C) = 70$, $Z(D) = 72$, and $Z(E) = 60$.

Since the maximum value of Z is 72 which occurs at the vertex D , the solution to the L.P.P. is $x = 18, y = 12$ and maximum $Z = 72$.

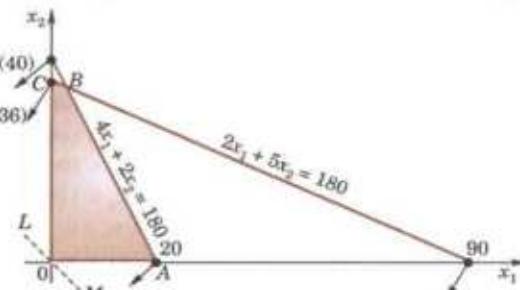

Fig. 34.5

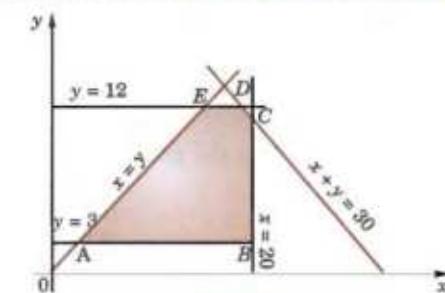

Fig. 34.6

Example 34.5. A company manufactures two types of cloth, using three different colours of wool. One yard length of type A cloth requires 4 oz of red wool, 5 oz of green wool and 3 oz of yellow wool. One yard length of type B cloth requires 5 oz of red wool, 2 oz of green wool and 8 oz of yellow wool. The wool available for manufacturer is 1000 oz of red wool, 1000 oz of green wool and 1200 oz of yellow wool. The manufacturer can make a profit of ₹ 5 on one yard of type A cloth and ₹ 3 on one yard of type B cloth. Find the best combination of the quantities of type A and type B cloth which gives him maximum profit by solving the L.P.P. graphically.

Solution. Let the manufacturer decide to produce x_1 yards of type A cloth and x_2 yards of type B cloth. Then the total income in rupees, from these units of cloth is given by

$$Z = 5x_1 + 3x_2 \quad \dots(i)$$

To produce these units of two types of cloth, he requires

$$\text{red wool} = 4x_1 + 5x_2 \text{ oz},$$

$$\text{green wool} = 5x_1 + 2x_2 \text{ oz},$$

$$\text{yellow wool} = 3x_1 + 8x_2 \text{ oz}.$$

and

Since the manufacturer does not have more than 1000 oz of red wool, 1000 oz of green wool and 1200 oz of yellow wool, therefore

$$4x_1 + 5x_2 \leq 1000 \quad \dots(ii)$$

$$5x_1 + 2x_2 \leq 1000 \quad \dots(iii)$$

$$3x_1 + 8x_2 \leq 1200 \quad \dots(iv)$$

Also

$$x_1 \geq 0, x_2 \geq 0. \quad \dots(v)$$

Thus the given problem is to maximize Z subject to the constraints (ii) to (v). (V.T.U., 2004)

Any point satisfying the condition (v) lies in the first quadrant only. Also the desired point satisfying the constraints (ii) to (iv) lies in the convex region $OABCD$ (Fig. 34.7). Its vertices are $O(0, 0)$, $A(200, 0)$, $B(3000/17, 1000/17)$, $C(2000/17, 1800/17)$ and $D(0, 150)$.

The values of Z at these vertices are given by $Z(O) = 0$, $Z(A) = 1000$, $Z(B) = 1057.6$, $Z(C) = 905.8$ and $Z(D) = 450$.

Since the maximum value of Z is 1058.8 which occurs at the vertex B , the solution to the given problem is $x_1 = 3000/17$, $x_2 = 1000/17$ and max. $Z = 1058.8$.

Hence the manufacturer should produce 176.5 yards of type A cloth, 58.8 yards of type B cloth, so as to get the maximum profit of ₹ 1058.8.

Example 34.6. A company making cold drinks has two bottling plants located at towns T_1 and T_2 . Each plant produces three drinks A, B and C and their production capacity per day is shown below:

Cold drinks	Plant at	
	T_1	T_2
A	6,000	2,000
B	1,000	2,500
C	3,000	3,000

The marketing department of the company forecasts a demand of 80,000 bottles of A, 22,000 bottles of B and 40,000 bottles of C during the month of June. The operating costs per day of plants at T_1 and T_2 are ₹ 6,000 and ₹ 4,000 respectively. Find (graphically) the number of days for which each plant must be run in June so as to minimize the operating costs while meeting the market demand.

Solution. Let the plants at T_1 and T_2 be run for x_1 and x_2 days. Then the objective is to minimize the operation costs i.e.,

$$\min. Z = 6000x_1 + 4000x_2 \quad \dots(i)$$

Constraints on the demand for the three cold drinks are:

$$\text{for } A, 6000x_1 + 2000x_2 \geq 80,000 \text{ or } 3x_1 + x_2 \geq 40 \quad \dots(ii)$$

$$\text{for } B, 1000x_1 + 2500x_2 \geq 22,000 \text{ or } x_1 + 2.5x_2 \geq 22 \quad \dots(iii)$$

$$\text{for } C, 3000x_1 + 3000x_2 \geq 40,000 \text{ or } x_1 + x_2 \geq 40/3 \quad \dots(iv)$$

$$\text{Also } x_1, x_2 \geq 0 \quad \dots(v)$$

Thus the L.P.P. is to minimize (i) subject to constraints (ii) to (v).

(V.T.U., 2000 S)

The solution space satisfying the constraints (ii) to (v) is shown shaded in Fig. 34.8. As seen from the direction of the arrows, the solution space is unbounded. The constraint (iv) is dominated by the constraints (ii) and (iii) and hence does not affect the solution space. Such a constraint as (iv) is called the redundant constraint.

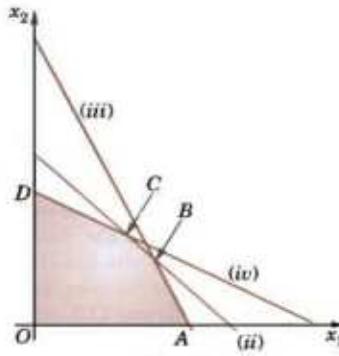

Fig. 34.7

The vertices of the convex region ABC are $A(22, 0)$, $B(12, 4)$ and $C(0, 40)$.

Values of the objective function (i) at these vertices are

$$Z(A) = 132,000, Z(B) = 88,000, Z(C) = 160,000.$$

Thus the minimum value of Z is ₹ 88,000 and it occurs at B . Hence the solution to the problem is $x_1 = 12$ days, $x_2 = 4$ days, $Z_{\min} = ₹ 88,000$.

Otherwise. Making $Z = 0$, (i) becomes $3x_1 + 2x_2 = 0$ which is represented by the dotted line LM through O . As Z is increased, the line LM moves parallel to itself, to the right. Since we are interested in finding the minimum value of Z , value of Z is increased till LM passes through the vertex nearest to the origin of the shaded region, i.e. $B(12, 4)$.

Thus the operating cost will be minimum for $x_1 = 12$ days, $x_2 = 4$ days and

$$Z_{\min} = 6000 \times 12 + 4000 \times 4 = ₹ 88,000.$$

Obs. The dotted line parallel to the line LM is called the *iso-cost line* since it represents all possible combinations of x_1, x_2 which produce the same total cost.

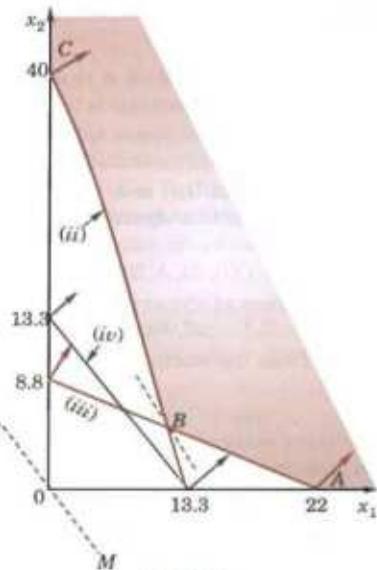

Fig. 34.8

34.4 SOME EXCEPTIONAL CASES

The constraints generally, give region of feasible solution which may be bounded or unbounded. In problems involving two variables and having a finite solution, we observed that the optimal solution existed at a vertex of the feasible region. In fact, this is true for all L.P. problems for which solutions exist. Thus it may be stated that *if there exists an optimal solution of an L.P.P., it will be at one of the vertices of the solution space*.

In each of the above examples, the optimal solution was unique. But it is not always so. In fact, *L.P.P. may have*

(i) a unique optimal solution, or (ii) an infinite number of optimal solutions, or (iii) an unbounded solution, or (iv) no solution.

We now give below a few examples to illustrate the exceptional cases (ii) to (iv).

Example 34.7. A firm uses milling machines, grinding machines and lathes to produce two motor parts. The machining times required for each part, the machining times available on different machines and the profit on each motor part are given below:

Type of machine	Machining time reqd. for the motor part (mts)		Max. time available per week (minutes)
	I	II	
Milling machines	10	4	2,000
Grinding machines	3	2	900
Lathes	6	12	3,000
Profit/unit (₹)	100	40	

Determine the number of parts I and II to be manufactured per week to maximize the profit.

Solution. Let x_1, x_2 be the number of parts I and II manufactured per week. Then objective being to maximize the profit, we have maximize $Z = 100x_1 + 40x_2$... (i)

Constraints being on the time available on each machine, we obtain

$$\text{for milling machines, } 10x_1 + 4x_2 \leq 2,000 \quad \dots (ii)$$

$$\text{for grinding machines, } 3x_1 + 2x_2 \leq 900 \quad \dots (iii)$$

for lathes,

$$6x_1 + 12x_2 \leq 3,000 \quad \dots(iv)$$

Also

$$x_1, x_2 \geq 0 \quad \dots(v)$$

Thus the problem is to determine x_1, x_2 which maximize (i) subject to the constraints (ii) to (v).

The solution space satisfying (ii), (iii), (iv) and meeting the non-negativity restrictions (v) is shown shaded in Fig. 34.9.

Note that (iii) is a redundant constraint as it does not affect the solution space. The vertices of the convex region $OABC$ are

$$O(0, 0), A(200, 0), B(125, 187.5), C(0, 250).$$

Values of the objective function (i) at these vertices are $Z(O) = 0$, $Z(A) = 20,000$, $Z(B) = 20,000$ and $Z(C) = 10,000$.

Thus the maximum value of Z occurs at two vertices A and B .

\therefore Any point on the line joining A and B will also give the same maximum value of Z i.e., there are infinite number of feasible solutions which yield the same maximum value of Z .

Thus there is no unique optimal solution to the problem and any point on the line AB can be taken to give the profit of ₹ 20,000.

Obs. An L.P.P. having more than one optimal solution, is said to have alternative or multiple optimal solutions. It implies that the resources can be combined in more than one way to maximize the profit.

Example 34.8. Using graphical method, solve the following L.P.P.:

Maximize

$$Z = 2x_1 + 3x_2 \quad \dots(i)$$

subject to

$$x_1 - x_2 \leq 2 \quad \dots(ii)$$

$$x_1 + x_2 \geq 4 \quad \dots(iii)$$

$$x_1, x_2 \geq 0. \quad \dots(iv)$$

(Kurukshetra, 2005; V.T.U., 2003 S)

Solution. Consider $x_1 - x_2$ coordinate system. Any point (x_1, x_2) satisfying the restrictions (iv) lies in the first quadrant only. The solution space satisfying the constraints (ii) and (iii) is the convex region shown shaded in Fig. 34.10.

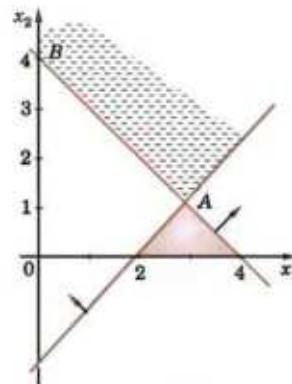

Fig. 34.10

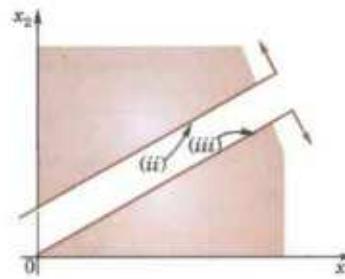

Fig. 34.11

Here the solution space is unbounded. The vertices of the feasible region (in the finite plane) are $A(3, 1)$ and $B(0, 4)$.

Values of the objective function (i) at these vertices are $Z(A) = 9$ and $Z(B) = 12$.

But there are points in this convex region for which Z will have much higher values. For instance, the point $(5, 5)$ lies in the shaded region and the value of Z thereat is 25. In fact, the maximum value of Z occurs at infinity. Thus the problem has an unbounded solution.

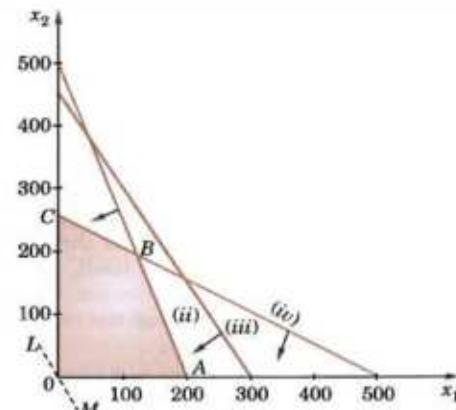

Fig. 34.9

Example 34.9 Solve graphically the following L.P.P.:

Maximize

$$Z = 4x_1 + 3x_2 \quad \dots(i)$$

subject to

$$x_1 - x_2 \leq -1, \quad \dots(ii)$$

$$-x_1 + x_2 \leq 0 \quad \dots(iii)$$

and

$$x_1, x_2 \geq 0 \quad \dots(iv)$$

Solution. Consider $x_1 - x_2$ coordinate system. Any point (x_1, x_2) satisfying (iv) lies in the first quadrant only. The two solution spaces, one satisfying (ii) and the other satisfying (iii) are shown shaded in Fig. 34.11.

There being no point (x_1, x_2) common to both the shaded regions, the problem cannot be solved. Hence the solution does not exist since the constraints are inconsistent.

Ques. The above problem had no solution because the constraints were incompatible. There may be cases in which the constraints are compatible but the problem may still have no feasible solution.

PROBLEMS 34.2

Using graphical method, solve the following L.P. problems:

1. Max. $Z = 3x_1 + 5x_2$
subject to $x_1 + 2x_2 \leq 200$, $x_1 + x_2 \leq 150$, $x_1 \leq 60$, $x_1, x_2 \geq 0$ (Rajasthan, 2003)

2. Max. $Z = 5x_1 + 7x_2$
subject to $x_1 + x_2 \leq 4$, $5x_1 + 8x_2 \leq 24$, $10x_1 + 7x_2 \leq 35$, and $x_1, x_2 \geq 0$.

3. Min. $Z = 20x_1 + 30x_2$
subject to $x_1 + 2x_2 \leq 40$, $3x_1 + x_2 \geq 30$, $4x_1 + 3x_2 \geq 60$, $x_1, x_2 \geq 0$.

(Kurukshetra, 2009 S; Mumbai, 2004; V.T.U., 2004)

4. Max. $Z = 3x_1 + 5x_2$ subject to $x_1 + 2x_2 \leq 2000$, $x_1 + x_2 \leq 1500$, $x_2 \leq 600$ and $x_1 \geq 0$, $x_2 \geq 0$. (Rohtak, 2004)

5. A firm manufactures two products A and B on which the profits earned per unit are ₹ 3 and ₹ 4 respectively. Each product is processed on two machines M_1 and M_2 . Product A requires one minute of processing time on M_1 and 2 minutes on M_2 while B requires one minute on M_1 and one minute on M_2 . Machine M_1 is available for not more than 7 hours and 30 minutes while M_2 is available for 10 hours during any working day. Find the number of units of products A and B to be manufactured to get maximum profit.

6. Two spare parts X and Y are to be produced in a batch. Each one has to go through two processes A and B . The time required in hours per unit and total time available are given below:

	X	Y	Total hours available
Process A	3	4	24
Process B	9	4	36

Profits per unit of X and Y are ₹ 5 and ₹ 6 respectively. Find how many number of spare parts of X and Y are to be produced in this batch to maximize the profit. (Each batch is complete in all respects and one cannot produce fractional units and stop the batch).

7. A manufacturer has two products I and II both of which are made in steps by machines A and B . The process times per hundred for the two products on the two machines are:

Product	$M/c. A$	$M/c. B$
I	4 hrs.	5 hrs.
II	5 hrs.	2 hrs.

Set-up times are negligible. For the coming period machine A has 100 hrs, and B has 80 hrs. The contribution for product I is ₹ 10 per 100 units and for product II is ₹ 5 per 100 units. The manufacturer is in a market which can absorb both products as much as he can produce for the immediate period ahead. Determine graphically, how much of products I and II, he should produce to maximize his contribution.

8. A production manager wants to determine the quantity to be produced per month of products A and B manufactured by his firm. The data on resources required and availability of resources are given below:

Resources	Requirements		Available per month
	Product A	Product B	
Raw material (kg.)	60	120	12,000
Machine hrs/piece	8	5	600
Assembly man hrs.	3	4	500
Sale price/piece	₹ 30	₹ 40	

Formulate the problem as a standard L.P.P. Find product mix that would give maximum profit by graphical technique.

9. A pineapple firm produces two products: canned pineapple and canned juice. The specific amounts of material, labour and equipment required to produce each product and the availability of each of these resources are shown in the table given below:

	Canned Juice	Pineapple	Available Resources
Labour (man hrs)	3	2.0	12.0
Equipment (m/c hrs)	1	2.3	6.9
Material (unit)	1	1.4	4.9

Assuming one unit each of canned juice and canned pineapple has profit margins of ₹ 2 and ₹ 1 respectively. Formulate this as L.P. problem and solve it graphically.

Solve the following L.P. problems graphically:

10. Maximize $Z = 6x + 4y$ subject to $2x + y \geq 1$, $3x + 4y \geq 1.5$ and $x, y \geq 0$. (Bombay, 2004)
11. Minimize $Z = 8x_1 + 12x_2$ subject to $60x_1 + 30x_2 \geq 240$, $30x_1 + 60x_2 \geq 300$, $30x_1 + 180x_2 \geq 540$, and $x_1, x_2 \geq 0$.
12. G.J. Breweries Ltd. have two bottling plants one located at 'G' and other at 'J'. Each plant produces three drinks: whiskey, beer and brandy. The number of bottles produced per day are as follows:

Drink	Plant at G	Plant at J
Whiskey	1500	1500
Beer	3000	1000
Brandy	2000	5000

A market survey indicates that during the month of July, there will be a demand of 20,000 bottles of whiskey, 40,000 bottles of beer and 44,000 bottles of brandy. The operating cost per day for plants at G and J are ₹ 600 and ₹ 400. For how many days each plant be run in July so as to minimize the production cost, while still meeting the market demand. Solve graphically.

34.5 GENERAL LINEAR PROGRAMMING PROBLEM

Any L.P.P. problem involving more than two variables may be expressed as follows:

Find the values of the variables x_1, x_2, \dots, x_n which maximize (or minimize) the objective function

$$Z = c_1x_1 + c_2x_2 + \dots + c_nx_n \quad \dots(i)$$

subject to the constraints

$$\left. \begin{array}{l} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n \leq b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n \leq b_2 \\ \dots \\ a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n \leq b_m \end{array} \right\} \quad \dots(ii)$$

and meet the non-negativity restrictions

$$x_1, x_2, \dots, x_n \geq 0. \quad \dots(iii)$$

Def. 1. A set of values x_1, x_2, \dots, x_n which satisfies the constraints of the L.P.P. is called its **solution**.

Def. 2. Any solution to a L.P.P. which satisfies the non-negativity restrictions of the problem is called its **feasible solution**.

Def. 3. Any feasible solution which maximizes (or minimizes) the objective function of the L.P.P. is called its **optimal solution**.

Some of the constraints in (ii) may be equalities, some others may be inequalities of (\leq) type and remaining ones inequalities of (\geq) type. The inequality constraints are changed to equalities by adding (or subtracting) non-negative variables to (from) the left hand side of such constraints.

Def. 4. If the constraints of a general L.P.P. be

$$\sum_{j=1}^n a_{ij}x_j \leq b_i \quad (i = 1, 2, \dots, k) \text{ then the non-negative variables } s_i \text{ which satisfy}$$

$\sum_{j=1}^n a_{ij}x_j + s_i = b_i$ ($i = 1, 2, \dots, k$), are called **slack variables**.

Def. 5. If the constraints of a general L.P.P. be

$\sum_{j=1}^n a_{ij}x_j \geq b_i$, ($i = k, k+1, \dots$) then the non-negative variables s_i which satisfy

$\sum_{j=1}^n a_{ij}x_j - s_i = b_i$, ($i = k, k+1, \dots$), are called **surplus variables**.

34.6 CANONICAL AND STANDARD FORMS OF L.P.P.

After the formulation of L.P.P., the next step is to obtain its solution. But before any method is used to find its solution, the problem must be presented in a suitable form. As such, we explain its following two forms:

(1) Canonical form. The general L.P.P. can always be expressed in the following form:

Maximize $Z = c_1x_1 + c_2x_2 + \dots + c_nx_n$

subject to the constraints $a_{i1}x_1 + a_{i2}x_2 + \dots + a_{in}x_n \leq b_i$; $i = 1, 2, \dots, m$

$$x_1, x_2, \dots, x_n \geq 0,$$

by making some elementary transformations. This form of the L.P.P. is called its **canonical form** and has the following characteristics:

(i) Objective function is of maximization type,

(ii) All constraints are of (\leq) type,

(iii) All variables x_i are non-negative.

The canonical form is a format for a L.P.P. which finds its use in the Duality theory.

(2) Standard form. The general L.P.P. can also be put in the following form:

Maximize $Z = c_1x_1 + c_2x_2 + \dots + c_nx_n$

subject to the constraints $a_{i1}x_1 + a_{i2}x_2 + \dots + a_{in}x_n = b_i$; $i = 1, 2, \dots, m$

$$x_1, x_2, \dots, x_n \geq 0,$$

This form of the L.P.P. is called its **standard form** and has the following characteristics:

(i) Objective function is of maximization type;

(ii) All constraints are expressed as equations;

(iii) Right hand side of each constraint is non-negative;

(iv) All variables are non-negative.

Obs. Any L.P.P. can be expressed in the standard form.

As minimize $Z = c_1x_1 + c_2x_2 + \dots + c_nx_n$

is equivalent to maximize $Z'(-Z) = -c_1x_1 - c_2x_2 - \dots - c_nx_n$,

the objective function can always be expressed in the maximization form.

The inequality constraints can always be converted to equalities by adding (or subtracting) the slack (or surplus) variables to the left hand sides of such constraints.

So far, the decision variables x_1, x_2, \dots, x_n have been assumed to be all non-negative. In actual practice, these variables could also be zero or negative. If a variable is negative, it can always be expressed as the difference of two non-negative variables e.g. a variable x_i can be written as

$$x_i = x_i' - x_i'' \quad \text{where } x_i' \geq 0, x_i'' \geq 0.$$

Example 34.10. Convert the following L.P.P. to the standard form:

Maximize $Z = 3x_1 + 5x_2 + 7x_3$

subject to $6x_1 - 4x_2 \leq 5, 3x_1 + 2x_2 + 5x_3 \geq 11, 4x_1 + 3x_3 \leq 2, x_1, x_2 \geq 0$.

Solution. As x_3 is unrestricted, let $x_3 = x_3' - x_3''$ where $x_3', x_3'' \geq 0$. Now the given constraints can be expressed as

$$6x_1 - 4x_2 \leq 5,$$

$$3x_1 + 2x_2 + 5x_3' - 5x_3'' \geq 11$$

$$\begin{aligned}4x_1 + 3x_2' - 3x_3'' &\leq 2 \\x_1, x_2, x_2', x_3'' &\geq 0.\end{aligned}$$

Introducing the slack/surplus variables, the problem in standard form becomes:

$$\begin{array}{ll}\text{Maximize} & Z = 3x_1 + 5x_2 + 7x_3' - 7x_3'' \\ \text{subject to} & 6x_1 - 4x_2 + s_1 = 5, \\ & 3x_1 + 2x_2 + 5x_3' - 5x_3'' - s_2 = 11, \\ & 4x_1 + 3x_3' - 3x_3'' + s_3 = 2, \\ & x_1, x_2, x_2', x_3'', s_1, s_2, s_3 \geq 0.\end{array}$$

Example 34.11. Express the following problem in the standard form:

$$\begin{array}{ll}\text{Minimize} & Z = 3x_1 + 4x_2 \\ \text{subject to} & 2x_1 - x_2 - 3x_3 = -4, \quad 3x_1 + 5x_2 + x_4 = 10, \quad x_1 - 4x_2 = 12, \quad x_1, x_2, x_4 \geq 0.\end{array}$$

Solution. Here x_3, x_4 are the slack/surplus variables and x_1, x_2 are the decision variables. As x_2 is unrestricted, let $x_2 = x_2' - x_2''$ where $x_2', x_2'' \geq 0$.

∴ The problem in standard form is

$$\begin{array}{ll}\text{Maximize} & Z' (= -Z) = -3x_1 - 4x_2' + 4x_2'' \\ \text{subject to} & -2x_1 + x_2' - x_2'' + 3x_3 = 4 \\ & 3x_1 + 5x_2' - 5x_2'' + x_4 = 10 \\ & x_1 - 4x_2' - 4x_2'' = 12 \\ & x_1, x_2', x_2'', x_3, x_4 \geq 0.\end{array}$$

34.7 | SIMPLEX METHOD

(1) While solving an L.P.P. graphically, the region of feasible solutions was found to be convex, bounded by vertices and edges joining them. The optimal solution occurred at some vertex. If the optimal solution was not unique, the optimal points were on an edge. These observations also hold true for the general L.P.P. Essentially the problem is that of finding the particular vertex of the convex region which corresponds to the optimal solution. The most commonly used method for locating the optimal vertex is the **simplex method**. This method consists in moving step by step from one vertex to the adjacent one. Of all the adjacent vertices, the one giving better value of the objective function over that of the preceding vertex, is chosen. This method of jumping from one vertex to the other is then repeated. Since the number of vertices is finite, the simplex method leads to an optimal vertex in a finite number of steps.

(2) In simplex method, an infinite number of solutions is reduced to a finite number of promising solutions by using the following facts:

(i) When there are m constraints and $(m+n)$ variables (m being $\leq n$), the starting solution is found by setting n variables equal to zero and then solving the remaining m equations, provided the solution exists and is unique. The **n zero variables are known as non-basic variables while the remaining m variables are called basic variables and they form a basic solution**.

(ii) In an L.P.P., the variables must always be non-negative. Some of the basic solutions may contain negative variables. Such solutions are called **basic infeasible solutions** and should not be considered. To achieve this, we start with a basic solution which is non-negative. The next basic solution must always be non-negative. This is ensured by feasibility condition. Such a solution is known as **basic feasible solution**.

If all the variables in the basic feasible solution are positive, then it is called **non-degenerate solution** and if some of the variables are zero, it is called **degenerate solution**.

(iii) A new basic feasible solution may be obtained from the previous one by equating one of the basic variables to zero and replacing it by a new non-basic variable. The eliminated variable is called the **outgoing variable** while the new variable is known as the **incoming variable**.

The incoming variable must improve the value of the objective function which is ensured by the optimality condition. This process is repeated till no further improvement is possible. The resulting solution is called the **optimal basic feasible solution** or simply **optimal solution**.

(3) The simplex method is, therefore, based on the following two conditions:

I. Feasibility condition. It ensures that if the starting solution is basic feasible, the subsequent will also be basic feasible.

II. Optimality condition. It ensures that only improved solutions will be obtained.

(4) Now, we shall elaborate the above terms in relation to the general linear programming problem in standard form, i.e.,

$$\text{Maximize} \quad Z = c_1x_1 + c_2x_2 + \dots + c_nx_n \quad \dots(1)$$

$$\text{subject to} \quad \sum_{j=1}^n a_{ij}x_j + s_i = b_i, \quad i = 1, 2, \dots, m \quad \dots(2)$$

$$\text{and} \quad x_j \geq 0, \quad s_i \geq 0, \quad j = 1, 2, \dots, n \quad \dots(3)$$

(i) **Solution.** x_1, x_2, \dots, x_n is a solution of the general L.P.P. if it satisfies the constraints (2).

(ii) **Feasible solution,** x_1, x_2, \dots, x_n is a feasible solution of the general L.P.P. if it satisfies both the constraints (2) and the non-negativity restrictions (3). The set S of all feasible solutions is called the feasible region. A linear programme is said to be *infeasible* when the set S is empty.

(iii) **Basic solution** is the solution of the m basic variables when each of the n non-basic variables is equated to zero.

(iv) **Basic feasible solution** is that *basic solution* which also satisfies the non-negativity restrictions (3).

(v) **Optimal solution** is that basic feasible solution which also optimizes the objective function (1) while satisfying the conditions (2) and (3).

(vi) **Non-degenerate basic feasible solution** is that basic feasible solution which contains exactly m non-zero basic variables. If any of the basic variables becomes zero, it is called a *degenerate basic feasible solution*.

Example 34.12. Find all the basic solutions of the following system of equations identifying in each case the basic and non-basic variables: $2x_1 + x_2 + 4x_3 = 11$, $3x_1 + x_2 + 5x_3 = 14$. (Mumbai, 2004; V.T.U., 2003 S)

Investigate whether the basic solutions are degenerate basic solutions or not. Hence find the basic-feasible solution of the system.

Solution. Since there are $m + n = 3$ variables and there are $m = 2$ constraints in this problem, a basic solution can be obtained by setting any one variable equal to zero and then solving the resulting equations. Also the total number of basic solutions = ${}^{m+n}C_m = {}^3C_2 = 3$.

The characteristics of the various basic solutions are as given below:

No. of basic sol.	Basic variables	Nonbasic variables	Values of basic variables	Is the sol. feasible? (Are all $x_j > 0$?)	Is the sol. degenerate?
1.	x_1, x_2	x_3	$2x_1 + x_2 = 11$ $3x_1 + x_2 = 14$ $\therefore x_1 = 3, x_2 = 5$	Yes	No
2.	x_2, x_3	x_1	$x_2 + 4x_3 = 11$ $x_2 + 5x_3 = 14$ $\therefore x_2 = 3, x_3 = -1$	No	Yes
3.	x_1, x_3	x_2	$2x_1 + 4x_3 = 11$ $3x_1 + 5x_3 = 14$ $\therefore x_1 = 1/2, x_3 = 5/2$	Yes	No

The basic feasible solutions are:

(i) $x_1 = 3, x_2 = 5, x_3 = 0$; (ii) $x_1 = 1/2, x_2 = 0, x_3 = 5/2$

which are also non-degenerate basic solutions.

Example 34.13. Find an optimal solution to the following L.P.P. by computing all basic solutions and then finding one that maximizes the objective function:

$$2x_1 + 3x_2 - x_3 + 4x_4 = 8, \quad x_1 - 2x_2 + 6x_3 - 7x_4 = -3, \quad x_1, x_2, x_3, x_4 \geq 0,$$

$$\text{Max. } Z = 2x_1 + 3x_2 + 4x_3 + 7x_4$$

Solution. Since there are four variables and two constraints, a basic solution can be obtained by setting any two variables equal to zero and then solving the resulting equations. Also the total number of basic solutions = ${}^4C_2 = 6$.

The characteristics of the various basic solutions are as given below:

No. of basic sol.	Basic variables	Non-basic variables	Values of basic variables	Is the sol. feasible ? (Are all $x_j \geq 0$?)	Value of Z	Is the sol. optimal ?
1.	x_1, x_2	$x_3, x_4 = 0$	$2x_1 + 3x_2 = 8$ $x_1 - 2x_2 = -3$ $\therefore x_1 = 1, x_2 = 2$	Yes	8	No
2.	x_1, x_3	$x_2, x_4 = 0$	$2x_1 - x_2 = 8$ $x_1 + 6x_3 = -3$ $x_1 = -14/13,$ $x_3 = -57/13$	No	—	—
3.	x_1, x_4	$x_2, x_3 = 0$	$2x_1 + 4x_4 = 8$ $x_1 - 7x_4 = -3$ $x_1 = 22/9,$ $x_4 = 7/9$	Yes	10.3	No
4.	x_2, x_3	$x_1, x_4 = 0$	$3x_2 - x_3 = 8$ $-2x_2 + 6x_3 = -3$ $x_2 = 45/16,$ $x_3 = 7/16$	Yes	10.2	No
5.	x_2, x_4	$x_1, x_3 = 0$	$3x_2 + 4x_4 = 8$ $-2x_2 - 7x_4 = -3$ $x_2 = 132/39,$ $x_4 = -7/13$	No	—	—
6.	x_3, x_4	$x_1, x_2 = 0$	$-x_3 + 4x_4 = 8$ $6x_3 - 7x_4 = -3$ $\therefore x_3 = 44/17,$ $x_4 = 45/17$	Yes	28.9	Yes

Hence the optimal basic feasible solution is

$x_1 = 0, x_2 = 0, x_3 = 44/17, x_4 = 45/17$ and the maximum value of $Z = 28.9$.

PROBLEMS 34.3

1. Reduce the following problem to the standard form:

Determine $x_1 \geq 0, x_2 \geq 0, x_3 \geq 0$ so as to

Maximize $Z = 3x_1 + 5x_2 + 8x_3$

subject to the constraints $2x_1 - 5x_2 \leq 6, 3x_1 + 2x_2 + x_3 \geq 5, 3x_1 + 4x_3 \leq 3$.

2. Express the following L.P.P. in the standard form

Maximize $Z = 3x_1 + 2x_2 + 5x_3$

subject to $-5x_1 + 2x_2 \leq 5, 2x_1 + 3x_2 + 4x_3 \geq 7, 2x_1 + 5x_3 \leq 3, x_1, x_2, x_3 \geq 0$. (Kurukshetra, 2009)

3. Convert the following L.P.P. to standard form:

Maximize $Z = 3x_1 - 2x_2 + 4x_3$

subject to $x_1 + 2x_2 + x_3 \leq 8, 2x_1 - x_2 + x_3 \geq 2, 4x_1 - 2x_2 - 3x_3 = -6, x_1, x_2 \geq 0$. (Kurukshetra, 2007 S)

4. Obtain all the basic solutions to the following system of linear equations:

$$x_1 + 2x_2 + x_3 = 4, 2x_1 + x_2 + 5x_3 = 5.$$

5. Show that the following system of linear equations has two degenerate feasible basic solutions and the non-degenerate basic solution is not feasible:

$$2x_1 + x_2 - x_3 = 2, 3x_1 + 2x_2 + x_3 = 3.$$

(Kurukshetra, 2007 S)

6. Find all the basic solutions to the following problem:

$$\text{Maximize } Z = x_1 + 3x_2 + 3x_3.$$

$$\text{subject to } x_1 + 2x_2 + 3x_3 = 4, 2x_1 + 3x_2 + 5x_3 = 7 \text{ and } x_1 \geq 0, x_2 \geq 0, x_3 \geq 0.$$

Which of the basic solutions are (a) non-degenerate basic feasible, (b) optimal basic feasible?

(Kurushetra, 2009 S; Mumbai, 2003)

34.8 WORKING PROCEDURE OF THE SIMPLEX METHOD

Assuming the existence of an initial basic feasible solution, an optimal solution to any L.P.P. by simplex method is found as follows:

Step 1. (i) Check whether the objective function is to be maximized or minimized.

$$\text{If } Z = c_1x_1 + c_2x_2 + c_3x_3 + \dots + c_nx_n$$

is to be minimized, then convert it into a problem of maximization, by writing

$$\text{Minimize } Z = \text{Maximize } (-Z)$$

(ii) Check whether all b 's are positive.

If any of the b_i 's is negative, multiply both sides of that constraint by -1 so as to make its right hand side positive.

Step 2. Express the problem in the standard form.

Convert all inequalities of constraints into equations by introducing slack/surplus variables in the constraints giving equations of the form

$$a_{11}x_1 + a_{12}x_2 + a_{13}x_3 + \dots + s_1 + 0s_2 + 0s_3 + \dots = b_1,$$

Step 3. Find an initial basic feasible solution.

If there are m equations involving n unknowns, then assign zero values to any $(n - m)$ of the variables for finding a solution. Starting with a basic solution for which $x_j : j = 1, 2, \dots, (n - m)$ are each zero, find all s_i . If all s_i are ≥ 0 , the basic solution is feasible and non-degenerate. If one or more of the s_i values are zero, then the solution is degenerate.

The above information is conveniently expressed in the following simplex table:

	c_j	c_1	c_2	$c_3 \dots 0$	0	0 ...
c_B	Basis	x_1	x_2	$x_3 \dots s_1$	s_2	$s_3 \dots b$
0	s_1	a_{11}	a_{12}	$a_{13} \dots 1$	0	$0 \dots b_1$
0	s_2	a_{21}	a_{22}	$a_{23} \dots 0$	1	$0 \dots b_2$
0	s_3	a_{31}	a_{32}	$a_{33} \dots 0$	0	$1 \dots b_3$
:	:	:	:	:	:	:
Body matrix					Unit matrix	

[The variables s_1, s_2, s_3 etc. are called *basic variables* and variables x_1, x_2, x_3 etc. are called non-basic variables. *Basis* refers to the basic variables $s_1, s_2, s_3 \dots c_j$ row denotes the coefficients of the variables in the objective function, while c_B -column denotes the coefficients of the basic variables only in the objective function. b -column denotes the values of the basic variables while remaining variables will always be zero. The coefficients of x 's (decision variables) in the constraint equations constitute the *body matrix* while coefficients of slack variables constitute the *unit matrix*.]

Step 4. Apply optimality test.

$$\text{Compute } C_j = c_j - Z_j ; \text{ where } Z_j = \sum c_B a_{ij}$$

[C_j -row is called *net evaluation row* and indicates the per unit increase in the objective function if the variable heading the column is brought into the solution.]

If all C_j are negative, then the initial basic feasible solution is *optimal*.

If even one C_j is positive, then the current feasible solution is not optimal (*i.e.*, can be improved) and proceed to the next step.

Step 5. (i) Identify the incoming and outgoing variables.

If there are more than one positive C_j , then the *incoming variable* is the one that heads the column containing maximum C_j . The column containing it is known as the *key column* which is shown marked with an

[For x_1 -column ($j = 1$), $Z_j = \sum c_B a_{j1} = 0(1) + 0(5) + 0(3) = 0$

and for x_2 -column ($j = 2$), $Z_j = \sum c_B a_{j2} = 0(1) + 0(2) + 0(8) = 0$

Similarly $Z_j(b) = 0(2) + 0(10) + 0(12) = 0$.

Step 4. Apply optimality test.

As C_j is positive under some columns, the initial basic feasible solution is not optimal (i.e. can be improved) and we proceed to the next step.

Step 5. (i) Identify the incoming and outgoing variables.

The above table shows that x_1 is the *incoming variable* as its incremental contribution $C_j (= 5)$ is maximum and the column in which it appears is the *key column* (shown marked by an arrow at the bottom).

Dividing the elements under b -column by the corresponding elements of key-column, we find minimum positive ratio θ is 2 in two rows. We, therefore, arbitrarily choose the row containing s_1 as the *key row* (shown marked by an arrow on its right end). The element at the intersection of key row and the key column i.e., (1), is the *key element*. s_1 is therefore, the *outgoing basic variable* which will now become non-basic.

Having decided that x_1 is to enter the solution, we have tried to find as to what maximum value x_1 could have without violating the constraints. So removing s_1 , the new basis will contain x_1 , s_2 and s_3 as the basic variables.

(ii) Iterate towards the optimal solution.

To transform the initial set of equations with a basic feasible solution into an equivalent set of equations with a different basic feasible solution, we make the key element unity. Here the key element being unity, we retain the key row as it is. Then to make all other elements in key column zero, we subtract proper multiples of key row from the other rows. Here we subtract 5 times the elements of key row from the second row and 3 times the elements of key row from the third row. These become the second and the third rows of the next table. We also change the corresponding value under c_B column from 0 to 5, while replacing s_1 by x_1 under the basis. Thus the *second basic feasible solution* is given by the following table :

c_j	5	3	0	0	0			
c_B	Basis	x_1	x_2	s_1	s_2	s_3	b	θ
5	x_1	1	1	1	0	0	2	
0	s_2	0	-3	-5	1	0	0	
0	s_3	0	5	-3	0	1	6	
	$Z_j = \sum c_B a_{j1}$	5	5	5	0	0	10	
	$C_j = c_j - Z_j$	0	-2	-5	0	0		

As C_j is either zero or negative under all columns, the above table gives the optimal basic feasible solution. This optimal solution is $x_1 = 2$, $x_2 = 0$ and maximum $Z = 10$.

Example 34.15. A firm produces three products which are processed on three machines. The relevant data is given below :

Machine	Time per unit (minutes)			Machine capacity (minutes/day)
	Product A	Product B	Product C	
M_1	2	3	2	440
M_2	4	—	3	470
M_3	2	5	—	430

The profit per unit for products A, B, and C is ₹ 4, ₹ 3 and ₹ 6 respectively. Determine the daily number of units to be manufactured for each product. Assume that all the units produced are consumed in the market.

Solution. Let the firm decide to produce x_1 , x_2 , x_3 units of products A, B, C, respectively. Then the L.P. model for this problem is :

$$\text{Max. } Z = 4x_1 + 3x_2 + 6x_3$$

subject to $2x_1 + 3x_2 + 2x_3 \leq 440$, $4x_1 + 3x_3 \leq 470$, $2x_1 + 5x_2 \leq 430$, $x_1, x_2, x_3 \geq 0$.

(V.T.U., 2004)

Step 1. Check whether the objective function is to be maximized and all b's are non-negative.

The problem being of maximization type and b's being ≥ 0 , this step is not necessary.

Step 2. Express the problem in the standard form.

By introducing the slack variables s_1, s_2, s_3 , the problem in standard form becomes :

$$\begin{array}{ll} \text{Max.} & Z = 4x_1 + 3x_2 + 6x_3 + 0s_1 + 0s_2 + 0s_3 \\ \text{subject to} & 2x_1 + 3x_2 + 2x_3 + s_1 + 0s_2 + 0s_3 = 440 \\ & 4x_1 + 0x_2 + 3x_3 + 0s_1 + s_2 + 0s_3 = 470 \\ & 2x_1 + 5x_2 + 0x_3 + 0s_1 + 0s_2 + s_3 = 430 \\ & x_1, x_2, x_3, s_1, s_2, s_3 \geq 0. \end{array}$$

Step 3. Find an initial basic feasible solution.

The basic (non-degenerate) feasible solution is

$$x_1 = x_2 = x_3 = 0 \text{ (non-basic)}$$

$$s_1 = 440, s_2 = 470, s_3 = 430 \text{ (basic)}$$

∴ Initial basic feasible solution is given by the following table :

c_B	c_j	4	3	6	0	0	0	b	0
	Basis	x_1	x_2	x_3	s_1	s_2	s_3		
0	s_1	2	3	2	1	0	0	440	440/2
0	s_2	4	0	(3)	0	1	0	470	470/3 ←
0	s_3	2	5	0	0	0	1	430	430/0
$Z_j = \Sigma c_B a_{ij}$		0	0	0	0	0	0		
$C_j = c_j - Z_j$		4	3	6	0	0	0		

Step 4. Apply optimality test.

As C_j is positive under some columns, the initial basic feasible solution is not optimal and we proceed to the next step.

Step 5. (i) Identify the incoming and outgoing variables.

The above table shows that x_3 is the incoming variable while s_2 is the outgoing variable and (3) is the key element.

(ii) Iterate towards the optimal solution.

Drop s_2 and introduce x_3 with its associated value 6 under c_B column. Convert the key element to unity and make all other elements of key column zero. Then the second feasible solution is given by the table below :

c_B	c_j	4	3	6	0	0	0	b	0
	Basis	x_1	x_2	x_3	s_1	s_2	s_3		
0	s_1	-2/3	(3)	0	1	-2/3	0	380/3	380/9 ←
6	s_2	4/3	0	1	0	1/3	0	470/3	=
0	s_3	2	5	0	0	0	1	430	86
Z_j		8	0	6	0	2	0	940	
C_j		-4	3	0	0	-2	0		
				↑					

Step 6. As C_j is positive under the second column, the solution is not optimal and we proceed further. Now x_2 is the incoming variable and s_1 is the outgoing variable and (3) is the key element for the next iteration.

Drop s_1 and introduce x_2 with its associated value 3 under c_B column. Convert the key element to unity and make all other elements of the key column zero. Then the third basic feasible solution is given by the following table :

c_B	c_j	4	3	6	0	0	0	b	0
	Basis	x_1	x_2	x_3	s_1	s_2	s_3		
3	x_2	-2/9	1	0	1/3	-2/9	0	380/9	
6	x_3	4/3	0	1	0	1/3	0	470/3	
0	s_3	28/9	0	0	-5/3	10/9	0	1970/9	
Z_j		22/3	3	6	1	4/3	0	3200/3	
C_j		-10/3	0	0	-1	-4/3	0		

Now since each $C_j \leq 0$, therefore it gives the optimal solution

$x_1 = 0, x_2 = 380/9, x_3 = 470/3$ and $Z_{\max} = 3200/3$ i.e., 1066.67 rupees.

Example 34.16. Solve the following L.P.P. by simplex method :

Minimize $Z = x_1 - 3x_2 + 3x_3$,

subject to $3x_1 - x_2 + 2x_3 \leq 7, 2x_1 + 4x_2 \geq -12, -4x_1 + 3x_2 + 8x_3 \leq 10, x_1, x_2, x_3 \geq 0$.

(Mumbai, 2004; V.T.U., 2003)

Solution. Consists of the following steps :

Step 1. Check whether objective function is to be maximized and all b's are non-negative.

As the problem is that of minimizing the objective function, converting it to the maximization type, we have Max. $Z' = -x_1 + 3x_2 - 3x_3$.

As the right hand side of the second constraint is negative, we write it as

$$-2x_1 - 4x_2 \leq 12$$

Step 2. Express the problem in the standard form.

By introducing the slack variables s_1, s_2, s_3 , the problem in the standard form becomes

$$\text{Max. } Z' = -x_1 + 3x_2 - 3x_3 + 0s_1 + 0s_2 + 0s_3$$

subject to

$$3x_1 - x_2 + 2x_3 + s_1 + 0s_2 + 0s_3 = 7$$

$$-2x_1 - 4x_2 + 0x_3 + 0s_1 + s_2 + 0s_3 = 12$$

$$-4x_1 + 3x_2 + 8x_3 + 0s_1 + 0s_2 + s_3 = 10$$

$$x_1, x_2, x_3, s_1, s_2, s_3 \geq 0.$$

Step 3. Find initial basic feasible solution.

The basic (non-degenerate) feasible solution is

$$x_1 = x_2 = x_3 = 0 \text{ (non-basic)}; s_1 = 7, s_2 = 12, s_3 = 10 \text{ (basic)}$$

∴ Initial basic feasible solution is given by the table below :

c_B	c_j	-1	3	-3	0	0	0	b	0
	Basis	x_1	x_2	x_3	s_1	s_2	s_3		
0	s_1	3	-1	2	1	0	0	7	$7/(-1)$
0	s_2	-2	-4	0	0	1	0	12	$12/(-4)$
0	s_3	-4	(3)	8	0	0	1	10	$10/3 \leftarrow$
$Z_j = \sum c_B a_{ij}$		0	0	0	0	0	0	0	
$C_j = c_j - Z_j$		-1	3	-3	0	0	0		
			↑						

Step 4. Apply optimality test.

As C_j is positive under second column, the initial basic feasible solution is not optimal and we proceed further.

Step 5. (i) Identify the incoming and outgoing variables.

The above table shows that x_2 is the incoming variable, s_3 is the outgoing variable and (3) is the key element.

(ii) Iterate towards the optimal solution.

∴ Drop s_3 and introduce x_2 with its associated value 3 under c_B column. Convert the key element to unity and make all other elements of the key column zero. Then the second basic feasible solution is given by the following table :

c_B	c_j	-1	3	-3	0	0	0	b	0
	Basis	x_1	x_2	x_3	s_1	s_2	s_3		
0	s_1	(5/3)	0	14/3	1	0	1/3	31/3	$31/5 \leftarrow$
0	s_2	-22/3	0	32/3	0	1	4/3	76/3	$-38/11$
3	x_2	-4/3	1	8/3	0	0	1/3	10/3	$-5/2$
	Z_j	-4	3	8	0	0	1	10	
	C_j	3	0	-11	0	0	-1		
		↑							

Step 6. As C_j is positive under first column, the solution is not optimal and we proceed further x_1 is the incoming variable, s_1 is the outgoing variable and $(5/3)$ is the key element.

∴ Drop s_1 and introduce x_1 with its associated value -1 under c_B column. Convert the key element to unity and make all other elements of the key column zero. Then the *third basic feasible solution* is given by the table below :

c_B	c_j Basis	-1 x_1	3 x_2	-3 x_3	0 s_1	0 s_2	0 s_3	b
-1	x_1	1	0	14/5	3/5	0	1/5	31/5
0	s_2	0	0	156/5	22/5	1	14/5	354/5
3	x_2	0	1	32/5	4/5	0	3/5	58/5
	Z_j	-1	3	82/5	9/5	0	8/5	143/5
	C_j	0	0	-97/5	-9/5	0	-8/5	

Now since each $C_j \leq 0$, therefore it gives the optimal solution

$$x_1 = 31/5, x_2 = 58/5, x_3 = 0 \text{ (non-basic) and } Z'_{\max} = 143/5$$

$$\text{Hence } Z_{\min} = -143/5.$$

Example 34.17. Maximize $Z = 107x_1 + x_2 + 2x_3$,

subject to the constraints : $14x_1 + x_2 - 6x_3 + 3x_4 = 7$,

$$16x_1 + \frac{1}{2}x_2 - 6x_3 \leq 5, 3x_1 - x_2 - x_3 \leq 0, x_1, x_2, x_3, x_4 \geq 0.$$

Solution. Consists of the following steps :

Step 1. Check whether objective function is to be maximized and all b 's are non-negative.

This step is not necessary.

Step 2. Express the problem in the standard form.

Here x_4 is a slack variable. By introducing other slack variables s_1 and s_2 the problem in standard form becomes

$$\text{Max. } Z = 107x_1 + x_2 + 2x_3 + 0x_4 + 0s_1 + 0s_2$$

$$\text{subject to } \frac{14}{3}x_1 + \frac{1}{3}x_2 - 2x_3 + x_4 + 0s_1 + 0s_2 = \frac{7}{3}$$

$$16x_1 + \frac{1}{2}x_2 - 6x_3 + 0x_4 + s_1 + 0s_2 = 5$$

$$3x_1 - x_2 - x_3 + 0x_4 + 0s_1 + s_2 = 0$$

$$x_1, x_2, x_3, x_4, s_1, s_2 \geq 0.$$

Step 3. Find initial basic feasible solution.

The basic feasible solution is

$$x_1 = x_2 = x_3 = 0 \text{ (non-basic); } x_4 = 7/3, s_1 = 5, s_2 = 0 \text{ (basic)}$$

∴ Initial basic feasible solution is given in the table below :

c_B	c_j Basis	107 x_1	1 x_2	2 x_3	0 x_4	0 s_1	0 s_2	b	0 s
0	x_4	$\frac{14}{3}$	$\frac{1}{3}$	-2	1	0	0	$\frac{7}{3}$	$\frac{7}{3}, \frac{14}{3}$
0	s_1	16	$\frac{1}{2}$	-6	0	1	0	5	5/16
0	s_2	(3)	-1	-1	0	0	1	0	0/3 ←
$Z_j = \Sigma c_B a_{ij}$		0	0	0	0	0	0	0	
$C_j = c_j - Z_j$		107	1	2	0	0	0		
		↑							

Step 4. Apply optimality test.

As C_j is positive under some columns, the initial basic feasible solution is not optimal and we proceed further.

Step 5. (i) Identify the incoming and outgoing variables.

The above table shows that x_1 is the incoming variable, s_2 is the outgoing variable and (3) is the key element.

(ii) Iterate towards the optimal solution.

Drop s_2 and introduce x_1 with its associated value 107 under c_B column. Convert key element to unity and make all other elements of the key column zeros. Then the second basic feasible solution is given by the following table :

c_j	107	1	2	0	0	0	b	θ
c_B	Basis	x_1	x_2	x_3	x_4	s_1	s_2	
0	x_4	0	17/9	-4/9	1	0	14/9	7/3
0	s_1	0	35/6	-2/3	0	1	-16/3	5
107	x_1	1	-1/3	-1/3	0	0	1/3	0
	Z_j	107	-107/3	-107/3	0	0	107/3	
	C_j	0	110/3	113/3	0	0	-107/3	
				↑				

As C_j is positive under some columns, the solution is not optimal. Here 113/3 being the largest positive value of C_j , x_3 is the incoming variable. But all the values of θ being ≤ 0 , x_3 will not enter the basis. This indicates that the solution to the problem is unbounded.

Remember that (i) the incoming variable is the non-basic variable corresponding to the largest positive value of C_j and

(ii) the outgoing variable is the basic-variable corresponding to the least positive ratio θ, obtained by dividing the b -column elements by the corresponding key-column elements.)

PROBLEMS 34.4

Using simplex method, solve the following L.P.P. (1–8) :

- Maximize $Z = x_1 + 3x_2$, subject to $x_1 + 2x_2 \leq 10$, $0 \leq x_1 \leq 5$, $0 \leq x_2 \leq 4$. (Kurushetra, 2009 ; V.T.U., 2003)
- Maximize $Z = 4x_1 + 10x_2$, subject to $2x_1 + x_2 \leq 50$, $2x_1 + 5x_2 \leq 100$, $2x_1 + 3x_2 \leq 90$, $x_1, x_2 \geq 0$. (Kurushetra, 2006)
- Maximize $Z = 4x_1 + 5x_2$, subject to $x_1 - 2x_2 \leq 2$, $2x_1 + x_2 \leq 6$, $x_1 + 2x_2 \leq 5$, $-x_1 + x_2 \leq 2$, $x_1, x_2 \geq 0$.
- Maximize $Z = 10x_1 + x_2 + 2x_3$, subject to $x_1 + x_2 - 2x_3 \leq 10$, $4x_1 + x_2 + x_3 \leq 20$, $x_1, x_2, x_3 \geq 0$.
- Maximize $Z = 3x_1 + 2x_2 + 5x_3$, subject to $x_1 + 2x_2 + x_3 \leq 430$, $3x_1 + 2x_2 \leq 460$, $x_1 + 4x_2 \leq 420$, $x_1, x_2, x_3 \geq 0$, (Mumbai, 2004)
- Minimize $Z = 3x_1 + 5x_2 + 4x_3$, subject to $2x_1 + 3x_2 \leq 8$, $2x_2 + 5x_3 \leq 10$, $3x_1 + 2x_2 + 4x_3 \leq 15$, $x_1, x_2, x_3 \geq 0$. (Mumbai, 2004 S)
- Minimize $Z = x_1 - 3x_2 + 2x_3$, subject to $3x_1 - x_2 + 2x_3 \leq 7$, $-2x_1 + 4x_2 \leq 12$, $-4x_1 + 3x_2 + 8x_3 \leq 10$, $x_1, x_2, x_3 \geq 0$. (Madras, 2006)
- Maximize $Z = 4x_1 + 3x_2 + 4x_3 + 6x_4$, subject to $x_1 + 2x_2 + 2x_3 + 4x_4 \leq 80$, $2x_1 + 2x_3 + x_4 \leq 60$, $3x_1 + 3x_2 + x_3 + x_4 \leq 80$, $x_1, x_2, x_3, x_4 \geq 0$.
- A firm produces products A and B and sells them at a profit of ₹ 2 and ₹ 3 each respectively. Each product is processed on machines G and H. Product A requires 1 minute on G and 2 minutes on H whereas product B requires 1 minute on each of the machines. Machine G is not available for more than 6 hrs. 40 min/day whereas the time constraint for machine H is 10 hrs. Solve this problem via simplex method for maximizing the profit.
- A company makes two types of products. Each product of the first type requires twice as much labour time as the second type. If all products are of second type only, the company can produce a total of 500 units a day. The market limits daily sales of the first and the second type to 150 and 250 units respectively. Assuming that the profits per

- unit are ₹ 8 for type I and ₹ 5 for type II, determine the number of units of each type to be produced to maximize profit?
11. The owner of a dairy is trying to determine the correct blend of two types of feed. Both contain various percentages of four essential ingredients. With the following data determine the least cost blend?

Ingredient	% per kg of feed		Min requirement in kg.
	Feed 1	Feed 2	
1	40	20	4
2	10	30	2
3	20	40	3
4	30	10	6
Cost (₹/kg.)	5	3	-

12. A manufacturing firm has discontinued production of a certain unprofitable product line. This created considerable excess production capacity. Management is considering to devote their excess capacity to one or more of three product 1, 2, and 3. The available capacity on machines and the number of machine-hours required for each unit of the respective product, is given below:

Machine Type	Available Time (hrs/week)	Productivity (hrs/unit)		
		Product 1	Product 2	Product 3
Milling machine	250	8	2	3
Lathe	150	4	3	-
Grinder	50	2	-	1

The unit profit would be ₹ 20, ₹ 6 and ₹ 8 respectively for products 1, 2 and 3. Find how much of each product the firm should produce in order to maximize profit.

13. The following table gives the various vitamin contents of three types of food and daily requirements of vitamins alongwith cost per unit. Find the combination of food for minimum cost.

Vitamin (mg)	Food F	Food G	Food H	Minimum daily requirement (mg)
A	1	1	10	1
C	100	10	10	50
D	10	100	10	10
Cost/unit (₹)	10	15	5	-

14. A farmer has 1,000 acres of land on which he can grow corn, wheat or soyabean. Each acre of corn costs ₹ 100 for preparation, requires 7 man-days of work and yields a profit of ₹ 30. An acre of wheat costs ₹ 120 to prepare, requires 10 man-days of work and yields a profit of ₹ 40. An acre of soyabean costs ₹ 70 to prepare, requires 8 man-days of work and yields a profit of ₹ 20. If the farmer has ₹ 100,000 for preparation and can count on 8,000 man-days of work, how many acres should be allocated to each crop to maximize profits?

34.9 ARTIFICIAL VARIABLE TECHNIQUES

So far we have seen that the introduction of slack/surplus variables provided the initial basic feasible solution. But there are many problems wherein at least one of the constraints is of (\geq) or (=) type and slack variables fail to give such a solution. There are two similar methods for solving such problems which we explain below :

(1) M-method or Method of Penalties. This method is due to A. Charnes and consists of the following steps :

Step 1. Express the problem in standard form.

Step 2. Add non-negative variables to the left hand side of all those constraints which are of (\geq) or (=) type. Such new variables are called *artificial variables* and the purpose of introducing these is just to obtain an initial basic feasible solution. But their addition causes violation of the corresponding constraints. As such, we would

like to get rid of these variables and would not allow them to appear in the final solution. For this purpose, we assign a very large penalty ($-M$) to these artificial variables in the objective function.

Step 3. Solve the modified L.P.P. by simplex method.

At any iteration of simplex method, one of the following three cases may arise :

(i) There remains no artificial variable in the basis and the optimality condition is satisfied. Then the solution is an optimal basic feasible solution to the problem.

(ii) There is at least one artificial variable in the basis at zero level (with zero value in b -column) and the optimality condition is satisfied. Then the solution is a degenerate optimal basic feasible solution.

(iii) There is at least one artificial variable in the basis at non-zero level (with positive value in b -column) and the optimality condition is satisfied. Then the problem has no feasible solution. The final solution is not optimal, since the objective function contains an unknown quantity M . Such a solution satisfies the constraints but does not optimize the objective function and is therefore, called *pseudo optimal solution*.

Step 4. Continue the simplex method until either an optimal basic feasible solution is obtained or an unbounded solution is indicated.

Obs. The artificial variables are only a computational device for getting a starting solution. Once an artificial variable leaves the basis, it has served its purpose and we forget about it i.e., the column for this variable is omitted from the next simplex table.

Example 34.18. Use Charnes' penalty method to

$$\text{Minimize } Z = 2x_1 + x_2$$

$$\text{subject to } 3x_1 + x_2 = 3; 4x_1 + 3x_2 \geq 6, x_1 + 2x_2 \leq 3, x_1, x_2 \geq 0. \quad (\text{Anna, M. Tech, 2006; V.T.U., 2000 S})$$

Solution. Consists of the following steps :

Step 1. Express the problem in standard form.

The second and third inequalities are converted into equations by introducing the surplus and slack variables s_1, s_2 respectively.

Also the first and second constraints being of (=) and (\geq) type, we introduce two artificial variables A_1, A_2 .

Converting the minimization problem to the maximization form, the L.P.P. can be rewritten as

$$\begin{aligned} \text{Max. } Z' &= -2x_1 - x_2 + 0s_1 + 0s_2 - MA_1 - MA_2 \\ \text{subject to } &3x_1 + x_2 + 0s_1 + 0s_2 + A_1 + 0A_2 = 3 \\ &4x_1 + 3x_2 - s_1 + 0s_2 + 0A_1 + A_2 = 6 \\ &x_1 + 2x_2 + 0s_1 + s_2 + 0A_1 + 0A_2 = 3 \\ &x_1, x_2, s_1, s_2, A_1, A_2 \geq 0 \end{aligned}$$

Step 2. Obtain an initial basic feasible solution.

Surplus variable s_1 is not a basic variable since its value is -6 . As negative quantities are not feasible, s_1 must be prevented from appearing in the initial solution. This is done by taking $s_1 = 0$. By setting the other non-basic variables x_1, x_2 each $= 0$, we obtain the initial basic feasible solution as

$$x_1 = x_2 = 0, s_1 = 0; A_1 = 3, A_2 = 6, s_2 = 3$$

Thus the initial simplex table is

	c_j	-2	-1	0	0	$-M$	$-M$		
c_B	Basis	x_1	x_2	s_1	s_2	A_1	A_2	b	0
$-M$	A_1	(3)	1	0	0	1	0	3	$3/3 \leftarrow$
$-M$	A_2	4	3	-1	0	0	1	6	$6/4$
0	s_2	1	2	0	1	0	0	3	$3/1$
$Z_j = \Sigma c_B a_{ij}$		-7M	-4M	M	0	-M	-M	-9M	
$C_j = c_j - Z_j$		7M - 2	4M - 1	-M	0	0	0		
		↑							

Since C_j is positive under x_1 and x_2 columns, this is not an optimal solution.

Step 3. Iterate towards optimal solution.

Introduce x_1 , and drop A_1 from basis.

∴ The new simplex table is

c_B	$Basis$	c_j	-2	-1	0	0	-M	
-2	x_1	x_1	1	1/3	0	0	0	1
-M	A_2		0	(5/3)	-1	0	1	2
0	s_2		0	5/3	0	1	0	2
		Z_j	-2	$-\frac{2}{3} - \frac{5M}{3}$	M	0	-M	$-2 - 2M$
		C_j	0	$-\frac{1}{3} + \frac{5M}{3}$	-M	0	0	
				↑				

Since C_j is positive under x_2 column, this is not an optimal solution.

∴ Introduce x_2 and drop A_2 .

Then the revised simplex table is

c_B	$Basis$	c_j	-2	-1	0	0		
-2	x_1	x_1	1	0	1/5	0	3/5	
-1	x_2		0	1	-3/5	0	6/5	
0	s_2		0	0	1	1	0	
		Z_j	-2	-1	1/5	0	-12/5	
		C_j	0	0	-1/5	0		

Since none of C_j is positive, this is an optimal solution. Thus, an optimal basic feasible solution to the problem is

$$x_1 = 3/5, x_2 = 6/5, \text{Max. } Z' = -12/5.$$

Hence the optimal value of the objective function is

$$\text{Min. } Z = -\text{Max. } Z' = -(-12/5) = 12/5$$

Example 34.19. Maximize $Z = 3x_1 + 2x_2$
subject to the constraints : $2x_1 + x_2 \leq 2, 3x_1 + 4x_2 \geq 12, x_1, x_2 \geq 0$.

Solution. Consists of the following steps :

Step 1. Express the problem in standard form.

The inequalities are converted into equations by introducing the slack and surplus variables s_1, s_2 respectively. Also the second constraint being of (\geq) type, we introduce the artificial variable A. Thus the L.P.P. can be rewritten as

$$\begin{aligned} \text{Max. } Z &= 3x_1 + 2x_2 + 0s_1 + 0s_2 - MA \\ \text{subject to } &2x_1 + x_2 + s_1 + 0s_2 + 0A = 2, \\ &3x_1 + 4x_2 + 0s_1 - s_2 + A = 12, \\ &x_1, x_2, s_1, A \geq 0 \end{aligned}$$

Step 2. Find an initial basic feasible solution.

Surplus variable s_2 is not a basic variable since its value is -12. Since a negative quantity is not feasible, s_2 must be prevented from appearing in the initial solution. This is done by letting $s_2 = 0$. By taking the other non-basic variables x_1 and x_2 each = 0, we obtain the initial basic feasible solution as

$$x_1 = x_2 = s_2 = 0, s_1 = 2, A = 12$$

∴ The initial simplex table is

c_B	$Basis$	c_j	3	2	0	0	-M	
0	s_1	x_1	2	(1)	1	0	0	2
-M	A		3	4	0	-1	1	12
$Z_j = \Sigma c_B a_{ij}$			$-3M$	$-4M$	0	M	$-M$	$-12M$
$C_j = c_j - Z_j$			$3 + 3M$	$2 + 4M$	0	$-M$	0	
			↑					

Since C_j is positive under some columns, this is not an optimal solution.

Step 3. Iterate towards optimal solution.

Introduce x_2 and drop s_1 .

∴ The new simplex table is

c_B	Basis	x_1	x_2	s_1	s_2	A	b
2	x_2	2	1	1	0	0	2
-M	A	-5	0	-4	-1	1	4
Z_j		$4 + 5M$	2	$2 + 4M$	M	$-M$	$4 - 4M$
C_j		$-(1 + 5M)$	0	$-(2 + 4M)$	$-M$	0	

Here each C_j is negative and an artificial variable appears in the basis at non-zero level. Thus there exists a *pseudo optimal solution* to the problem.

(2) Two-phase method. This is another method to deal with the artificial variables wherein the L.P.P. is solved in two phases.

Phase I. Step 1. Express the given problem in the standard form by introducing slack, surplus and artificial variables.

Step 2. Formulate an artificial objective function

$$Z^* = -A_1 - A_2 \dots - A_m$$

by assigning (-1) cost to each of the artificial variables A_i and zero cost to all other variables.

Step 3. Maximize Z^* subject to the constraints of the original problem using the simplex method. Then three cases arise :

(a) Max. $Z^* < 0$ and at least one artificial variable appears in the optimal basis at a positive level

In this case, the original problem doesn't possess any feasible solution and the procedure comes to an end.

(b) Max. $Z^* = 0$ and no artificial variable appears in the optimal basis.

In this case, a basic feasible solution is obtained and we proceed to phase II for finding the optimal basic feasible solution to the original problem.

(c) Max. $Z^* = 0$ and at least one artificial variable appears in the optimal basis at zero level.

Here a feasible solution to the auxiliary L.P.P. is also a feasible solution to the original problem with all artificial variables set = 0.

To obtain a basic feasible solution, we prolong phase I for pushing all the artificial variables out of the basis (without proceeding on to phase II).

Phase II. The basic feasible solution found at the end of phase I is used as the starting solution for the original problem in this phase i.e., the final simplex table of phase I is taken as the initial simplex table of phase II and the artificial objective function is replaced by the original objective function. Then we find the optimal solution.

Example 34.20. Use two-phase method to

$$\text{Minimize } Z = 7.5x_1 - 3x_2$$

subject to the constraints $3x_1 - x_2 - x_3 \geq 3$, $x_1 - x_2 + x_3 \geq 2$,

$$x_1, x_2, x_3 \geq 0.$$

Phase I. Step 1. Express the problem in standard form.

Solution. Introducing surplus variables s_1 , s_2 and artificial variables A_1 , A_2 , the phase I problem in standard form becomes

$$\text{Max. } Z^* = 0x_1 + 0x_2 + 0x_3 + 0s_1 + 0s_2 - A_1 - A_2$$

subject to $3x_1 - x_2 - x_3 - s_1 + 0s_2 + A_1 + 0A_2 = 3$

$$x_1 - x_2 + x_3 + 0s_1 - s_2 + 0A_1 + A_2 = 2$$

$$x_1, x_2, x_3, s_1, s_2, A_1, A_2 \geq 0.$$

Step 2. Find an initial basic feasible solution.

$$\text{Setting } x_1 = x_2 = x_3 = s_1 = s_2 = 0,$$

we have $A_1 = 3$, $A_2 = 2$ and $Z^* = -5$

∴ Initial simplex table is

c_B	c_j	0	0	0	0	0	-1	-1	b	0
	Basis	x_1	x_2	x_3	s_1	s_2	A_1	A_2		
-1	A_1	(3)	-1	-1	-1	0	1	0	3	1 ←
-1	A_2	1	-1	1	0	-1	0	1	2	2
Z_j^*	$\sum c_B a_{ij}^T$	-4	2	0	1	1	-1	-1	-5	
$C_j = c_j - Z_j^*$		4	-2	0	-1	-1	0	0		
		↑								

As C_j is positive under x_1 column, this solution is not optimal.

Step 3. Iterate towards an optimal solution.

Making key element (3) unity and replacing A_1 by x_1 , we have the new simplex table :

c_B	c_j	0	0	0	0	0	-1	-1	b	0
	Basis	x_1	x_2	x_3	s_1	s_2	A_1	A_2		
0	x_1	1	-1/3	-1/3	-1/3	0	1/3	0	1	-3
-1	A_2	0	-2/3	(4/3)	1/3	-1	-1/3	1	1	3/4 ←
Z_j^*	0	2/3	-4/3	-1/3	1	1/3	-1	-1		
C_j	0	-2/3	4/3	1/3	-1	-1/3	0			
		↑								

Since C_j is positive under x_3 and s_1 columns, this solution is not optimal.

Making key element (4/3) unity and replacing A_2 by x_3 , we obtain the revised simplex table :

c_B	c_j	0	0	0	0	0	-1	-1	b
	Basis	x_1	x_2	x_3	s_1	s_2	A_1	A_2	
0	x_1	1	-1/2	0	-1/4	-1/4	1/4	1/4	5/4
0	x_2	0	-1/2	1	1/4	-3/4	-1/4	3/4	3/4
Z_j^*	0	0	0	0	0	0	0	0	0
C_j	0	0	0	0	0	0	-1	-1	
		↑							

Since all $C_j \leq 0$, this table gives the optimal solution. Also $Z_{\max}^* = 0$ and no artificial variable appears in the basis. Thus an optimal basic feasible solution to the auxiliary problem and therefore to the original problem, has been attained.

Phase II. Considering the actual costs associated with the original variables, the objective function is

$$\text{Max. } Z' = -15/2x_1 + 3x_2 + 0x_3 + 0s_1 + 0s_2 - 0A_1 - 0A_2$$

$$\text{subject to } 3x_1 - x_2 - x_3 - s_1 + 0s_2 + A_1 + 0A_2 = 3,$$

$$x_2 - x_2 + x_3 + 0s_1 - s_2 + 0A_1 + A_2 = 2,$$

$$x_1, x_2, x_3, s_1, s_2, A_1, A_2 \geq 0$$

The optimal initial feasible solution thus obtained, will be an optimal basic feasible solution to the original L.P.P.

Using final table of phase I, the initial simplex table of phase II is as follows :

c_B	c_j	-15/2	3	0	0	0	b
	Basis	x_1	x_2	x_3	s_1	s_2	
-15/2	x_1	1	-1/2	0	-1/4	-1/4	5/4
0	x_3	0	-1/2	1	1/4	-3/4	3/4
Z_j	-15/2	15/4	0	15/8	15/8		-75/8
C_j	0	-3/4	0	-15/8	-15/8		
		↑					

Since all $C_j \leq 0$, this solution is optimal.

Hence an optimal basic feasible solution to the given problem is

$$x_1 = 5/4, x_2 = 0, x_3 = 3/4 \quad \text{and} \quad \min. Z = 75/8.$$

34.10 EXCEPTIONAL CASES

(1) Tie for the incoming variable. When more than one variable has the same largest positive value in C_j row (in maximization problem), a tie for the choice of incoming variable occurs. As there is no method to break this tie, we choose any one of the prospective incoming variables arbitrarily. Such an arbitrary choice does not in any way affect the optimal solution.

(2) Tie for the outgoing variable. When more than one variable has the same least positive ratio under the θ -column, a tie for the choice of outgoing variable occurs. If the equal values of said ratio are > 1 , choose any one of the prospective leaving variables arbitrarily. Such an arbitrary choice doesn't affect the optimal solution.

If the equal values of ratios are zero, the simplex method fails and we make use of the following degeneracy technique.

(3) Degeneracy. We know that a basic feasible solution is said to be degenerate if any of the basic variables vanishes. This phenomenon of getting a degenerate basic feasible solution is called *degeneracy* which may arise.

- (i) at the initial state, when atleast one basic variable is zero in the initial basic feasible solution or (ii) at any subsequent stage, when the least positive ratios under θ -column are equal for two or more rows.

In this case, an arbitrary choice of one of these basic variables may result in one or more basic variables becoming zero in the next iteration. At times, the same sequence of simplex iterations is repeated endlessly without improving the solution. These are termed as *cycling* type of problems. Cycling occurs very rarely. In fact, cycling has seldom occurred in practical problems.

To avoid cycling, we apply the following perturbation procedure:

- (i) Divide each element in the tied rows by the *positive coefficients* of the key column in that row.
 - (ii) Compare the resulting ratios (from left to right) first of unit matrix and then of the body matrix, column by column.
 - (iii) The outgoing variable lies in that row which first contains the smallest algebraic ratio.

Example 34.21. Maximize $Z = 5x_1 + 3x_2$.

subject to $x_1 + x_2 \leq 2$, $5x_1 + 2x_2 \leq 10$, $3x_1 + 8x_2 \leq 12$; $x_1, x_2 \geq 0$

Solution. Consists of the following steps :

Step 1: Express the problem in the standard form

Introducing the slack variables s_1, s_2, s_3 , the problem in the standard form is

$$\begin{aligned} \text{Max. } Z &= 5x_1 + 3x_2 + 0s_1 + 0s_2 + 0s_3 \\ x_1 + x_2 + s_1 + 0s_2 + 0s_3 &= 2 \\ 5x_1 + 2x_2 + 0s_1 + s_2 + 0s_3 &= 10 \\ 3x_1 + 8x_2 + 0s_1 + 0s_2 + s_3 &= 12 \\ x_1, x_2, s_1, s_2, s_3 &\geq 0. \end{aligned}$$

Step 2. Find the initial basic feasible solution.

The initial basic feasible solution is

$x_1 = x_2 = 0$ (non-basic)

∴ Initial simplex table is

c_B	c_j	5	3	0	0	0	b	0
0	s_1	1	1	1	0	0	2	2/1
0	s_2	(5)	2	0	1	0	10	10/5←
0	s_3	3	8	0	0	1	12	12/3
$Z_j = \sum c_B a_{ij}$		0	0	0	0	0	0	
$C_j = c_j - Z_j$		5	3	0	0	0		
		↑						

As C_j is positive under x_2 columns, this solution is not optimal.

Step 3. Iterate towards optimal solution.

x_1 is the incoming variable. But the first two rows have the same ratio under θ -column. Therefore we apply perturbation method.

First column of the unit matrix has 1 and 0 in the tied rows. Dividing these by the corresponding elements of the key columns, we get 1/1 and 0/5, s_2 -row gives the smaller ratio and therefore s_2 is the first outgoing variable and (5) is the key element.

Thus the new simplex table is

c_B	c_j	5	3	0	0	0	b	θ
	Basis	x_1	x_2	s_1	s_2	s_3		
0	s_1	0	(3/5)	1	-1/5	0	0	0
5	x_1	1	2/5	0	1/5	0	2	5 ←
0	s_3	0	34/5	0	-3/5	1	6	15/17
Z _j		5	2	0	1	0	10	
C _j		0	1	0	-1	0		
			↑					

As C_j is positive under x_2 column, this solution is not optimal.

Making key element (3/5) unity and replacing s_1 by x_2 , we obtain the revised simplex table :

c_B	c_j	5	3	0	0	0	b
	Basis	x_1	x_2	s_1	s_2	s_3	
3	x_2	0	1	5/3	-1/3	0	0
5	x_1	1	0	-2/3	1/3	0	2
0	s_3	0	0	-34/3	5/3	1	6
Z _j		5	3	5/3	2/3	0	10
C _j		0	0	-5/3	-2/3	0	

As $C_j \leq 0$ under all columns, this table gives the optimal solution. Hence an optimal basic feasible solution is $x_1 = 2$, $x_2 = 0$ and $Z_{\max} = 10$.

PROBLEMS 34.5

Solve the following L.P. problems using M-method :

- Maximize $Z = 3x_1 + 2x_2 + 3x_3$
subject to : $2x_1 + x_2 + x_3 \leq 2$, $3x_1 + 4x_2 + 2x_3 \geq 8$, $x_1, x_2, x_3 \geq 0$.
- Maximize $Z = 2x_1 + x_2 + 3x_3$
subject to : $x_1 + x_2 + 2x_3 \leq 5$, $2x_1 + 3x_2 + 4x_3 = 12$, $x_1, x_2, x_3 \geq 0$.
- Maximize $Z = 8x_3$
subject to : $x_1 - x_2 \geq 0$, $2x_1 + 3x_2 \leq -6$, x_1, x_2 unrestricted.
- Maximize $Z = 5x_1 - 2x_2 + 3x_3$
subject to : $2x_1 + 2x_2 - x_3 \geq 2$, $3x_1 - 4x_2 \leq 3$, $x_2 + 3x_3 \leq 5$, $x_1, x_2, x_3 \geq 0$.
- Maximize $Z = x_1 + 2x_2 + 3x_3 - x_4$
subject to : $x_1 + 2x_2 + 3x_3 = 15$, $2x_1 + x_2 + 5x_3 = 20$,
 $x_1 + 2x_2 + x_3 + x_4 = 10$, $x_1, x_2, x_3, x_4 \geq 0$.

(Mumbai, 2004)

(Madras, 2003)

Use two phase method to solve the following L.P. problems :

- Minimize $Z = x_1 + x_2$
subject to : $2x_1 + x_2 \geq 4$, $x_1 + 7x_2 \geq 7$,
 $x_1, x_2 \geq 0$.
- Maximize $Z = 5x_1 + 3x_2$
subject to : $2x_1 + x_2 \leq 1$, $x_1 + 4x_2 \geq 6$,
 $x_1, x_2 \geq 0$.

(Rajasthan, 2005)

(Kottayam, 2005)

8. Maximize $Z = 5x_1 - 4x_2 + 3x_3$,
 subject to : $2x_1 + 2x_2 - x_3 \geq 2$,
 $3x_1 - 4x_2 \leq 3$, $x_2 + x_3 \leq 5$,
 $x_1, x_2, x_3 \geq 0$. (Mumbai, 2009)

- $$\begin{aligned} \text{9. Maximize } Z &= 5x_1 - 4x_2 + 3x_3, \\ \text{subject to: } 2x_1 + x_2 - 6x_3 &\leq 20, \\ 8x_1 + 5x_2 + 10x_3 &\leq 76, \\ 8x_1 - 3x_2 + 6x_3 &\leq 50, \\ x_1, x_2, x_3 &\geq 0. \end{aligned}$$

Solve the following degenerate L.P. problems:

10. Maximize $Z = 9x_1 + 3x_2$
 subject to : $4x_1 + x_2 \leq 8$, $2x_1 + x_2 \leq 4$,
 $x_1, x_2 \geq 0$.

- $$\begin{aligned} \text{11. Maximize } Z &= 2x_1 + 3x_2 + 10x_3 \\ \text{subject to: } x_1 + 2x_3 &= 0, \quad x_2 + x_3 = 1, \\ &x_1, x_2, x_3 \geq 0. \end{aligned}$$

34.11 (1) DUALITY CONCEPT

One of the most interesting concepts in linear programming is the *duality* theory. Every linear programming problem has associated with it, another linear programming problem involving the same data and closely related optimal solutions. Such two problems are said to be *duals* of each other. While one of these is called the *primal*, the other the *dual*.

The importance of the duality concept is due to two main reasons. Firstly, if the primal contains a large number of constraints and a smaller number of variables, the labour of computation can be considerably reduced by converting it into the dual problem and then solving it. Secondly, the interpretation of the dual variables from the cost or economic point of view proves extremely useful in making future decisions in the activities being programmed.

(2) Formulation of dual problem. Consider the following L.P.P. :

$$\begin{aligned} & \text{Maximize } Z = c_1x_1 + c_2x_2 + \dots + c_nx_n \\ \text{subject to the constraints} \quad & a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n \leq b_1, \\ & a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n \leq b_2, \\ & \dots \\ & a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n \leq b_m \\ & x_1, x_2, \dots, x_n \geq 0. \end{aligned}$$

To construct the dual problem, we adopt the following guidelines:

(i) The maximization problem in the primal becomes the minimization problem in the dual and vice versa.

(ii) (\leq) type of constraints in the primal become (\geq) type of constraints in the dual and vice versa.

(iii) The coefficients c_1, c_2, \dots, c_n in the objective function of the primal become b_1, b_2, \dots, b_m in the objective function of the dual.

(iv) The constants b_1, b_2, \dots, b_m in the constraints of the primal become c_1, c_2, \dots, c_n in the constraints of the dual.

(v) If the primal has n variables and m constraints, the dual will have m variables and n constraints i.e. the transpose of the body matrix of the primal problem gives the body matrix of the dual.

(vi) The variables in both the primal and dual are non-negative.

Then the dual problem will be

$$\begin{aligned} & \text{Minimize } W = b_1 y_1 + b_2 y_2 + \dots + b_m y_m \\ \text{subject to the constraints} \quad & a_{11}y_1 + a_{21}y_2 + \dots + a_{m1}y_m \geq c_1, \\ & a_{12}y_1 + a_{22}y_2 + \dots + a_{m2}y_m \geq c_2, \\ & \dots \\ & a_{1n}y_1 + a_{2n}y_2 + \dots + a_{mn}y_m \geq c_n \\ & y_1, y_2, \dots, y_m \geq 0. \end{aligned}$$

Example 34.22. Write the dual of the following L.P.P.

Minimize

$$Z = 3x_1 - 2x_2 + 4x_3$$

subject to

$$3x_1 + 5x_2 + 4x_3 \geq 7, 6x_1 + x_2 + 3x_3 \geq 4, 7x_1 - 2x_2 - x_3 \leq 10, \\ x_1 - 2x_2 + 5x_3 \geq 3, 4x_1 + 7x_2 - 2x_3 \geq 2, x_1, x_2, x_3 \geq 0.$$

Solution. Since the problem is of minimization, all constraints should be of \geq type. We multiply the third constraint throughout by -1 so that $-7x_1 + 2x_2 + x_3 \geq -10$.

Let y_1, y_2, y_3, y_4 and y_5 be the dual variables associated with the above five constraints. Then the dual problem is given by

$$\begin{array}{ll} \text{Maximize} & W = 7y_1 + 4y_2 - 10y_3 + 3y_4 + 2y_5 \\ \text{subject to} & 3y_1 + 6y_2 - 7y_3 + y_4 + 4y_5 \leq 3, 5y_1 + y_2 + 2y_3 - 2y_4 + 7y_5 \leq -2, \\ & 4y_1 + 3y_2 + y_3 + 5y_4 - 2y_5 \leq 4, y_1, y_2, y_3, y_4, y_5 \geq 0. \end{array}$$

(3) **Formulation of dual problem when the primal has equality constraints.** Consider the problem

$$\begin{array}{ll} \text{Maximize} & Z = c_1x_1 + c_2x_2 \\ \text{subject to} & a_{11}x_1 + a_{12}x_2 = b_1, a_{21}x_1 + a_{22}x_2 = b_2, x_1, x_2 \geq 0. \end{array}$$

The equality constraint can be written as

$$\begin{aligned} a_{11}x_1 + a_{12}x_2 &\leq b_1 \text{ and } a_{11}x_1 + a_{12}x_2 \geq b_1 \\ a_{11}x_1 + a_{12}x_2 &\leq b_1 \text{ and } -a_{11}x_1 - a_{12}x_2 \leq -b_1, \end{aligned}$$

or Then the above problem can be restated as

$$\begin{array}{ll} \text{Maximize} & Z = c_1x_1 + c_2x_2 \\ \text{subject to} & a_{11}x_1 + a_{12}x_2 \leq b_1, -a_{11}x_1 - a_{12}x_2 \leq -b_1, \\ & a_{21}x_1 + a_{22}x_2 \leq b_2, x_1, x_2 \geq 0. \end{array}$$

Now we form the dual using y_1', y_1'', y_2 as the dual variables. Then the dual problem is

$$\begin{array}{ll} \text{Minimize} & W = b_1(y_1' - y_1'') + b_2y_2, \\ \text{subject to} & a_{11}(y_1' - y_1'') + a_{21}y_2 \geq c_1, a_{12}(y_1' - y_1'') + a_{22}y_2 \geq c_2, y_1', y_1'', y_2 \geq 0. \end{array}$$

The term $(y_1' - y_1'')$ appears in both the objective function and all the constraints of the dual. This will always happen whenever there is an equality constraint in the primal. Then the new variable $y_1' - y_1'' (= y_1)$ becomes unrestricted in sign being the difference of two non-negative variables and the above dual problem takes the form.

$$\begin{array}{ll} \text{Minimize} & W = b_1y_1 + b_2y_2, \\ \text{subject to} & a_{11}y_1 + a_{21}y_2 \geq c_1, a_{12}y_1 + a_{22}y_2 \geq c_2, y_1 \text{ unrestricted in sign}, y_2 \geq 0. \end{array}$$

In general, if the primal problem is

$$\begin{array}{ll} \text{Maximize} & Z = c_1x_1 + c_2x_2 + \dots + c_nx_n, \\ \text{subject to} & \begin{aligned} a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n &= b_1 \\ a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n &= b_2 \\ \dots \\ a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n &= b_m \\ x_1, x_2, \dots, x_n &\geq 0. \end{aligned} \end{array}$$

then the dual problem is

$$\begin{array}{ll} \text{Minimize} & W = b_1y_1 + b_2y_2 + \dots + b_my_m \\ \text{subject to} & \begin{aligned} a_{11}y_1 + a_{21}y_2 + \dots + a_{m1}y_m &\geq c_1, \\ a_{12}y_1 + a_{22}y_2 + \dots + a_{m2}y_m &\geq c_2, \\ \dots \\ a_{1n}y_1 + a_{2n}y_2 + \dots + a_{mn}y_m &\geq c_n \\ y_1, y_2, \dots, y_m &\text{ all unrestricted in sign.} \end{aligned} \end{array}$$

Thus the dual variables corresponding to equality constraints are unrestricted in sign. Conversely when the primal variables are unrestricted in sign, corresponding dual constraints are equalities.

Example 34.23. Construct the dual of the L.P.P. :

$$\begin{array}{ll} \text{Maximize} & Z = 4x_1 + 9x_2 + 2x_3, \\ \text{subject to} & 2x_1 + 3x_2 + 2x_3 \leq 7, 3x_1 - 2x_2 + 4x_3 = 5, x_1, x_2, x_3 \geq 0. \end{array}$$

Solution. Let y_1 and y_2 by the dual variables associated with the first and second constraints. Then the dual problem is

$$\begin{array}{ll} \text{Minimize} & W = 7y_1 + 5y_2, \\ \text{subject to} & 2y_1 + 3y_2 \leq 4, 3y_1 - 2y_2 \leq 9, 2y_1 + 4y_2 \leq 2, y_1 \geq 0, y_2 \text{ is unrestricted in sign.} \end{array}$$

PROBLEMS 34.6

Write the duals of the following problems (1 – 4) :

- Maximize $Z = 10x_1 + 13x_2 + 19x_3$
subject to $6x_1 + 5x_2 + 3x_3 \leq 26, 4x_1 + 2x_2 + 5x_3 \leq 7, x_1, x_2, x_3 \geq 0$.
- Minimize $Z = 2x_1 + 4x_2 + 3x_3$,
subject to $3x_1 + 4x_2 + x_3 \geq 11, -2x_1 - 3x_2 + 2x_3 \leq -7, x_1 - 2x_2 - 3x_3 \leq -1$
 $3x_1 + 2x_2 + 2x_3 \geq 5, x_1, x_2, x_3 \geq 0$.
- Maximize $Z = 3x_1 + 16x_2 + 7x_3$
subject to $x_1 - x_2 + x_3 \geq 3, -3x_1 + 2x_3 \leq 1, 2x_1 + x_2 - x_3 = 4, x_1, x_2, x_3 \geq 0$.
- Minimize $Z = 3x_1 - 3x_2 + x_3$
subject to $2x_1 - 3x_2 + x_3 \leq 5, 4x_1 - 2x_2 \geq 9, -8x_1 + 4x_2 + 3x_3 = 8$
 $x_1, x_2 \geq 0$ and x_3 is unrestricted.

(Mumbai, 2004)

- Obtain the dual problem of the following L.P.P.

$$\text{Maximize } f(x) = 2x_1 + 5x_2 + 6x_3$$

$$\text{subject to } 6x_1 + 6x_2 - x_3 \leq 3, -2x_1 + x_2 + 4x_3 \leq 4, x_1 - 5x_2 + 3x_3 \leq 1,$$

$$-3x_1 - 3x_2 + 7x_3 \leq 5, x_1, x_2, x_3 \geq 0.$$

Also verify that the dual of the dual problem is the primal problem.

34.12 (1) DUALITY PRINCIPLE

If the primal and the dual problems have feasible solutions then both have optimal solutions and the optimal value of the primal objective function is equal to the optimal value of the dual objective function i.e.,

$$\text{Max. } Z = \text{Min. } W$$

This is the fundamental theorem of duality. It suggests that an optimal solution to the primal problem can directly be obtained from that of the dual problem and vice-versa.

(2) Working rules for obtaining an optimal solution to the primal (dual) problem from that of the dual (primal) :

Suppose we have already found an optimal solution to the dual (primal) problem by simplex method.

Rule I. If the primal variable corresponds to a slack starting variable in the dual problem, then its optimal value is directly given by the coefficient of the slack variable with changed sign, in the C_j row of the optimal dual simplex table and vice-versa.

Rule II. If the primal variable corresponds to an artificial variable in the dual problem, then its optimal value is directly given by the coefficient of the artificial variable, with changed sign, in the C_j row of the optimal dual simplex table, after deleting the constant M and vice-versa.

On the other hand, if the primal has an unbounded solution, then the dual problem will not have a feasible solution and vice-versa.

Now we shall workout two examples to demonstrate the primal dual relationships.

Example 34.24. Construct the dual of the following problem and solve both the primal and the dual :

$$\text{Maximize } Z = 2x_1 + x_2$$

$$\text{subject to } -x_1 + 2x_2 \leq 2, x_1 + x_2 \leq 4, x_1 \leq 3, x_1, x_2 \geq 0.$$

(Rohtak, 2005)

Solution. Using the primal problem. Since only two variables are involved, it is convenient to solve the problem graphically.

In the x_1, x_2 -plane, the five constraints show that the point (x_1, x_2) lies within the shaded region $OABCD$ of Fig. 34.12. Values of the objective function $Z = 2x_1 + x_2$ at these corners are $Z(0) = 0$, $Z(A) = 6$, $Z(B) = 7$, $Z(C) = 6$ and $Z(D) = 1$. Hence the optimal solution is $x_1 = 3, x_2 = 1$ and max. (Z) = 7.

Solution. Using the dual problem. The dual problem of the given primal is :

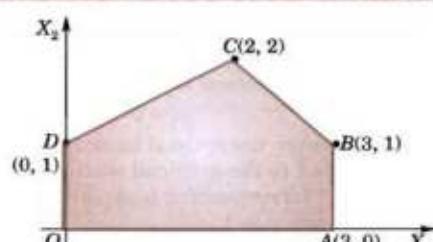

Fig. 34.12

$$\text{Minimize } W = 2y_1 + 4y_2 + 3y_3$$

$$\text{subject to } -y_1 + y_2 + y_3 \geq 2, 2y_1 + y_2 \geq 1, y_1, y_2 \geq 0.$$

Step 1. Express the problem in the standard form.

Introducing the slack and the artificial variables, the dual problem in the standard form is

$$\text{Max. } W' = -2y_1 - 4y_2 - 3y_3 + 0s_1 + 0s_2 - MA_1 - MA_2$$

$$\text{subject to } -y_1 + y_2 + y_3 - s_1 + 0s_2 + A_1 + 0A_2 = 2,$$

$$2y_1 + y_2 + 0y_3 + 0s_1 - s_2 + 0A_1 + A_2 = 1$$

Step 2. Find an initial basic feasible solution.

Setting the non-basic variables y_1, y_2, y_3, s_1, s_2 , each equal to zero, we get the initial basic feasible solution as

$$y_1 = y_2 = y_3 = s_1 = s_2 = 0 \text{ (non-basic); } A_1 = 2, A_2 = 1. \quad (\text{basic})$$

∴ Initial simplex table is

	c_j	-2	-4	-3	0	0	-M	-M		
c_B	Basis	y_1	y_2	y_3	s_1	s_2	A_1	A_2	b	0
-M	A_1	-1	1	1	-1	0	1	0	2	2/1
-M	A_2	2	(1)	0	0	-1	0	1	1	1/1 ←
	Z_j	-M	-2M	-M	M	M	-M	-M	-3M	
	C_j	$M - 2$	$2M - 4$	$M - 3$	$-M$	$-M$	0	0		

↑

As C_j is positive under some columns, the initial solution is not optimal.

Step 3. Iterate towards an optimal solution.

(i) Introduce y_2 and drop A_2 . Then the new simplex table is

	c_j	-2	-4	-3	0	0	-M	-M		
c_B	Basis	y_1	y_2	y_3	s_1	s_2	A_1	A_2	b	0
-M	A_1	-3	0	(1)	-1	1	1	-1	1	1/1 ←
-4	y_2	2	1	0	0	-1	0	1	1	1/0
	Z_j	$3M - 8$	-4	-M	M	$4 - M$	-M	$M - 4$	$-M - 4$	
	C_j	$6 - 3M$	0	$M - 3$	$-M$	$M - 4$	0	$4 - 2M$		

↑

As C_j is positive under some columns, this solution is not optimal.

(ii) Now introduce y_3 and drop A_1 . Then the revised simplex table is

	c_j	-2	-4	-3	0	0	-M	-M		
c_B	Basis	y_1	y_2	y_3	s_1	s_2	A_1	A_2	b	
-3	y_3	-3	0	1	-1	1	1	-1	1	
-4	y_2	2	1	0	0	-1	0	1	1	
	Z_j	1	-4	-3	3	1	-3	-1	-7	
	C_j	-3	0	0	-3	-1	$3 - M$	$1 - M$		

As all $C_j \leq 0$, the optimal solution is attained.

Thus an optimal solution to the dual problem is

$$y_1 = 0, y_2 = 1, y_3 = 1, \text{ Min. } W = -\text{Max. } (W') = 7.$$

To derive the optimal basic feasible solution to the primal problem, we note that the primal variables x_1, x_2 correspond to the artificial starting dual variables A_1, A_2 respectively. In the final simplex table of the dual problem, C_j corresponding to A_1, A_2 are 3 and 1 respectively after ignoring M . Thus by rule II, we get opt. $x_1 = 3$ and opt. $x_2 = 1$.

Hence an optimal basic feasible solution to the given primal is

$$x_1 = 3, x_2 = 1; \text{ max. } Z = 7.$$

Obs. The validity of the duality theorem is therefore, checked since $\max. Z = \min. W = 7$ from both the methods.

Example 34.25. Using duality solve the following problem :

$$\text{Minimize } Z = 0.7x_1 + 0.5x_2$$

$$\text{subject to } x_1 \geq 4, x_2 \geq 6, x_1 + 2x_2 \geq 20, 2x_1 + x_2 \geq 18, x_1, x_2 \geq 0.$$

(V.T.U., 2004)

Solution. The dual of the given problem is Max. $W = 4y_1 + 6y_2 + 20y_3 + 18y_4$,

$$\text{subject to } y_1 + y_3 + 2y_4 \leq 0.7, y_2 + 2y_3 + y_4 \leq 0.5, y_1, y_2, y_3, y_4 \geq 0.$$

Step 1. Express the problem in the standard form.

Introducing slack variables, the dual problem in the standard form becomes

$$\text{Max. } W = 4y_1 + 6y_2 + 20y_3 + 18y_4 + 0s_1 + 0s_2,$$

$$\text{subject to } y_1 + 0y_2 + y_3 + 2y_4 + s_1 + 0s_2 = 0.7,$$

$$0y_1 + y_2 + 2y_3 + y_4 + 0s_1 + s_2 = 0.5, y_1, y_2, y_3, y_4, s_1, s_2 \geq 0.$$

Step 2. Find an initial basic feasible solution.

Setting non-basic variables y_1, y_2, y_3, y_4 each equal to zero, the basic solution is

$$y_1 = y_2 = y_3 = y_4 = 0 \quad (\text{non-basic}); s_1 = 0.7, s_2 = 0.5 \quad (\text{basic})$$

Since the basic variables $s_1, s_2 > 0$, the initial basic solution is feasible and non-degenerate.

Initial simplex table is

	c_j	4	6	20	18	0	0	b	0
c_B	Basis	y_1	y_2	y_3	y_4	s_1	s_2		
0	s_1	1	0	1	2	1	0	0.7	0.7/1
0	s_2	0	1	(2)	1	0	1	0.5	0.5/2 ←
	Z_j	0	0	0	0	0	0	0	
	C_j	4	6	20	18	0	0		
			↑						

As C_j is positive in some columns, the initial basic solution is not optimal.

Step 3. Iterate towards an optimal solution.

(i) Introduce y_3 and drop s_2 . Then the new simplex table is

	c_j	4	6	20	18	0	0	b	0
c_B	Basis	y_1	y_2	y_3	y_4	s_1	s_2		
0	s_1	1	-1/2	0	(3/2)	1	-1/2	9/20	3/10 ←
20	y_3	0	1/2	1	1/2	0	1/2	1/4	1/2
	Z_j	0	10	20	10	0	10	5	
	C_j	4	-4	0	8	0	-10		
			↑						

As C_j is positive under some of the columns, this solution is not optimal.

(ii) Introduce y_4 and drop s_1 . Then the revised simplex table is

	c_j	4	6	20	18	0	0	b
c_B	Basis	y_1	y_2	y_3	y_4	s_1	s_2	
18	y_4	2/3	-1/3	0	1	2/3	-1/3	3/10
20	y_3	-1/3	2/3	1	0	-1/3	2/3	1/10
	Z_j	16/3	22/3	20	18	16/3	22/3	74/10
	C_j	-4/3	-4/3	0	0	-16/13	-22/3	
			↑					

As all $C_j \leq 0$, this table gives the optimal solution.

Thus the optimal basic feasible solution is $y_1 = 0, y_2 = 0, y_3 = 20, y_4 = 18$, max. $W = 7.4$.

Step 4. Derive optimal solution to the primal.

We note that the primal variables x_1, x_2 correspond to the slack starting dual variables s_1, s_2 respectively. In the final simplex table of the dual problem, C_j values corresponding to s_1 and s_2 are $-16/3$ and $-22/3$ respectively.

Thus, by rule I, we conclude that opt. $x_1 = 16/3$ and opt. $x_2 = 22/3$.

Hence an optimal basic feasible solution to the given primal is

$$x_1 = 16/3, x_2 = 22/3; \text{ min. } Z = 7.4.$$

Obs. To check the validity of the duality theorem, the student is advised to solve the given L.P.P. directly by simplex method and see that min. $Z = \max. W = 7.4$.

PROBLEMS 34.7

Using duality solve the following problems (1–4) :

1. Minimize $Z = 2x_1 + 9x_2 + x_3$,
subject to $x_1 + 4x_2 + 2x_3 \geq 5, 3x_1 + x_2 + 2x_3 \geq 4$ and $x_1, x_2 \geq 0$. (J.N.T.U., 2001)
2. Maximize $Z = 2x_1 + x_2$,
subject to $x_1 + 2x_2 \leq 10, x_1 + x_2 \leq 6, x_1 - x_2 \leq 2, x_1 - 2x_2 \leq 1, x_1, x_2 \geq 0$. (Andhra M. Tech., 2006)
3. Maximize $Z = 3x_1 + 2x_2$,
subject to $x_1 + x_2 \geq 1, x_1 + x_2 \leq 7, x_1 + 2x_2 \leq 10, x_2 \leq 3, x_1, x_2 \geq 0$.
4. Maximize $Z = 3x_1 + 2x_2 + 5x_3$
subject to $x_1 + 2x_2 + x_3 \leq 430, 3x_1 + 2x_3 \leq 460, x_1 + 4x_2 \leq 420, x_1, x_2, x_3 \geq 0$.

34.13 (1) DUAL SIMPLEX METHOD

In § 34.9, we have seen that a set of basic variables giving a feasible solution can be found by introducing artificial variables and using M -method or Two phase method. Using the primal-dual relationships for a problem, we have another method (known as *Dual simplex method*) for finding an initial feasible solution. Whereas the regular simplex method starts with a basic feasible (but non-optimal) solution and works towards optimality, the dual simplex method starts with a basic unfeasible (but optimal) solution and works towards feasibility. The dual simplex method is quite similar to the regular simplex method, the only difference lies in the criterion used for selecting the incoming and outgoing variables. In the dual simplex method, we first determine the outgoing variable and then the incoming variable while in the case of regular simplex method reverse is done.

(2) Working procedure for dual simplex method :

Step 1. (i) Convert the problem to maximization form, if it is not so.

(ii) Convert (\geq) type constraints, if any to (\leq) type by multiplying such constraints by -1 .

(iii) Express the problem in standard form by introducing slack variables.

Step 2. Find the initial basic solution and express this information in the form of dual simplex table.

Step 3. Test the nature of $C_j = c_j - Z_j$:

(a) If all $C_j \leq 0$ and all $b_i \geq 0$, then optimal basic feasible solution has been attained.

(b) If all $C_j \leq 0$ and at least one $b_i < 0$, then go to step 4.

(c) If any $C_j \geq 0$, the method fails.

Step 4. Mark the outgoing variable. Select the row that contains the most negative b_i . This will be the key row and the corresponding basic variable is the outgoing variable.

Step 5. Test the nature of key row elements :

(a) If all these elements are ≥ 0 , the problem does not have a feasible solution.

(b) If at least one element < 0 , find the ratios of the corresponding elements of C_j -row to these elements. Choose the smallest of these ratios. The corresponding column is the key column and the associated variable is the incoming variable.

Step 6. Iterate towards optimal feasible solution. Make the key element unity. Perform row operations as in the regular simplex method and repeat iterations until either an optimal feasible solution is attained or there is an indication of non-existence of a feasible solution.

Example 34.26. Using dual simplex method :

$$\text{maximize } -3x_1 - 2x_2$$

$$\text{subject to } x_1 + x_2 \geq 1, x_1 + x_2 \leq 7, x_1 + 2x_2 \geq 10, x_2 \geq 3, x_1 \geq 0, x_2 \geq 0.$$

(Mumbai, 2004)

Solution. Consists of the following steps :

Step 1. (i) Convert the first and third constraints into (\leq) type. These constraints become

$$-x_1 - x_2 \leq -1, -x_1 - 2x_2 \leq -10.$$

(ii) Express the problem in standard form

Introducing slack variables s_1, s_2, s_3, s_4 the given problem takes the form

$$\text{Max. } Z = -3x_1 - 2x_2 + 0s_1 + 0s_2 + 0s_3 + 0s_4$$

$$\text{subject to } -x_1 - x_2 + s_1 = -1, x_1 + x_2 + s_2 = 7, -x_1 - 2x_2 + s_3 = -10, \\ x_2 + s_4 = 3, x_1, x_2, s_1, s_2, s_3, s_4 \geq 0.$$

Step 2. Find the initial basic solution

Setting the decision variables x_1, x_2 each equal to zero, we get the basic solution

$$x_1 = x_2 = 0, s_1 = -1, s_2 = 7, s_3 = -10, s_4 = 3 \text{ and } Z = 0.$$

∴ Initial solution is given by the table below :

c_B	c_j	-3	-2	0	0	0	0	b
	Basis	x_1	x_2	s_1	s_2	s_3	s_4	
0	s_1	-1	-1	1	0	0	0	-1
0	s_2	1	1	0	1	0	0	7
0	s_3	-1	(-2)	0	0	1	0	-10 ←
0	s_4	0	1	0	0	0	1	3
$Z_j = \sum c_B a_{ij}$		0	0	0	0	0	0	0
$C_j = c_j - Z_j$		-3	-2	0	0	0	0	
			↑					

Step 3. Test nature of C_j

Since all C_j values are ≤ 0 and $b_1 = -1, b_3 = -10$, the initial solution is optimal but infeasible. We therefore, proceed further.

Step 4. Mark the outgoing variable.

Since b_3 is negative and numerically largest, the third row is the key row and s_3 is the outgoing variable.

Step 5. Calculate ratios of elements in C_j -row to the corresponding negative elements of the key row.

These ratios are $-3/-1 = 3, -2/-2 = 1$ (neglecting ratios corresponding to +ve or zero elements of key row). Since the smaller ratio is 1, therefore, x_2 -column is the key column and (-2) is the key element.

Step 6. Iterate towards optimal feasible solution.

(i) Drop s_3 and introduce x_2 alongwith its associated value -2 under c_B column. Convert the key element to unity and make all other elements of the key column zero. Then the second solution is given by the table below :

c_B	c_j	-3	-2	0	0	0	0	b
	Basis	x_1	x_2	s_1	s_2	s_3	s_4	
0	s_1	$-\frac{1}{2}$	0	1	0	$-\frac{1}{2}$	0	4
0	s_2	$\frac{1}{2}$	0	0	1	$\frac{1}{2}$	0	2
-2	x_2	$\frac{1}{2}$	1	0	0	$-\frac{1}{2}$	0	5
0	s_4	$(-\frac{1}{2})$	0	0	0	$\frac{1}{2}$	1	-2 ←
$Z_j = \sum c_B a_{ij}$		-1	-2	0	0	1	0	-10
$C_j = c_j - Z_j$		-2	0	0	0	-1	0	
			↑					

Since all C_j values are ≤ 0 and $b_4 = -2$, this solution is optimal but infeasible. We therefore proceed further.

(ii) *Mark the outgoing variable.*

Since b_4 is negative, the fourth row is the key row and s_4 is the outgoing variable.

(iii) *Calculate ratios of elements in C_j -row to the corresponding negative elements of the key row.*

This ratio is $-2/-\frac{1}{2} = 4$ (neglecting other ratios corresponding to +ve or 0 elements of key row).

$\therefore x_1$ -column is the key column and $(-\frac{1}{2})$ is the key element.

(iv) *Drop s_4 and introduce x_1 with its associated value -3 under the c_B column. Convert the key element to unity and make all other elements of the key column zero. Then the third solution is given by the table below :*

c_B	$Basis$	c_j	-3	-2	0	0	0	0	b
0	s_1	x_1	0	0	1	0	-1	-1	6
0	s_2	x_2	0	0	0	1	1	1	0
-2	x_2	x_1	0	1	0	0	0	1	3
-3	x_1	x_2	1	0	0	0	-10	-2	4
Z _j		-3	-2	0	0	3	4		-18
C _j		0	0	0	0	-3	-4		

Since all C_j values are ≤ 0 and all b 's are ≥ 0 , therefore this solution is optimal and feasible. Thus the optimal solution is $x_1 = 4$, $x_2 = 3$ and $Z_{\max} = -18$.

Example 34.27. Using dual simplex method, solve the following problem :

$$\text{Minimize } Z = 2x_1 + 2x_2 + 4x_3$$

$$\text{subject to } 2x_1 + 3x_2 + 5x_3 \geq 2, 3x_1 + x_2 + 7x_3 \leq 3, x_1 + 4x_2 + 6x_3 \leq 5, x_1, x_2, x_3 \geq 0.$$

(Kurukshetra, 2009; Kerala, 2005)

Solution. Consists of the following steps :

Step 1. (i) Convert the given problem to maximization form by writing

$$\text{Maximize } Z' = -2x_1 - 2x_2 - 4x_3.$$

(ii) Convert the first constraint into (\leq) type. Thus it is equivalent to

$$-2x_1 - 3x_2 - 4x_3 \leq -2$$

(iii) Express the problem in standard form.

Introducing slack variables, s_1, s_2, s_3 , the given problem becomes

$$\text{Max. } Z' = -2x_1 - 2x_2 - 4x_3 + 0s_1 + 0s_2 + 0s_3$$

$$\text{subject to } -2x_1 - 3x_2 - 5x_3 + s_1 + 0s_2 + 0s_3 = -2,$$

$$3x_1 + x_2 + 7x_3 + 0s_1 + s_2 + 0s_3 = 3,$$

$$x_1 + 4x_2 + 6x_3 + 0s_1 + 0s_2 + s_3 = 5,$$

$$x_1, x_2, x_3, s_1, s_2, s_3 \geq 0.$$

Step 2. Find the initial basic solution.

Setting the decision variables x_1, x_2, x_3 each equal to zero, we get the basic solution

$$x_1 = x_2 = x_3 = 0, s_1 = -2, s_2 = 3, s_3 = 5 \text{ and } Z' = 0.$$

\therefore Initial solution is given by the table below :

c_B	$Basis$	c_j	-2	-2	-4	0	0	0	b
0	s_1	x_1	-2	(-3)	-5	1	0	0	-2 ←
0	s_2	x_2	3	1	7	0	1	0	3
0	s_3	x_3	1	4	6	0	0	1	5
Z _j		0	0	0	0	0	0	0	0
C _j		-2	-2	-4	0	0	0		
					↑				

Step 3. Test nature of C_j

Since all C_j values are ≤ 0 and $b_1 = -2$, the initial solution is optimal but infeasible.

Step 4. Mark the outgoing variable.

Since $b_1 < 0$, the first row is the key row and s_1 is the outgoing variable.

Step 5. Calculate the ratio of elements of C_j row to the corresponding negative elements of the key row.

These ratios are $-2/-2 = 1$, $-2/-3 = 0.67$, $-4/-5 = 0.8$.

Since 0.67 is the smallest ratio, x_2 -column is the key column and (-3) is the key element.

Step 6. Iterate towards optimal feasible solution.

Drop s_1 and introduce x_2 with its associated value -2 under c_B column. Then the revised dual simplex table is

c_j	-2	-2	-4	0	0	0		
c_B	Basis	x_1	x_2	x_3	s_1	s_2	s_3	b
-2	x_2	2/3	1	5/3	-1/3	0	0	2/3
0	s_2	7/3	0	16/3	1/3	1	0	7/3
0	s_3	-5/3	0	-2/3	4/3	0	1	7/3
	Z_j	-4/3	-2	-10/3	2/3	0	0	-4/3
	C_j	-2/3	0	-2/3	-2/3	0	0	

Since all $C_j \leq 0$ and all b_i 's are > 0 , this solution is optimal and feasible. Thus the optimal solution is

$$x_1 = 0, x_2 = 2/3, x_3 = 0 \text{ and } \max Z' = -4/3 \text{ i.e., min. } Z = 4/3.$$

PROBLEMS 34.8

Using dual simplex method, solve the following problems :

- Maximize $Z = -3x_1 - x_2$
subject to $x_1 + x_2 \geq 1, 2x_1 + 3x_2 \geq 2; x_1, x_2 \geq 0$.
- Minimize $Z = 2x_1 + x_2$,
subject to $3x_1 + x_2 \geq 3, 4x_1 + 3x_2 \geq 6, x_1 + 2x_2 \leq 3, x_1, x_2 \geq 0$.
- Minimize $Z = x_1 + 2x_2 + 3x_3$,
subject to $2x_1 - x_2 + x_3 \geq 4, x_1 + x_2 + 2x_3 \leq 8, x_2 - x_3 \geq 2; x_1, x_2, x_3 \geq 0$.
- Minimize $Z = x_1 + 2x_2 + x_3 + 4x_4$
subject to $2x_1 + 4x_2 + 5x_3 + x_4 \geq 10, 3x_1 - x_2 + 7x_3 - 2x_4 \geq 2$
 $5x_1 + 2x_2 + x_3 + 6x_4 \geq 15, x_1, x_2, x_3, x_4 \geq 0$.

(Kurukshetra, 2007 S)

34.14 (1) TRANSPORTATION PROBLEM

This is a special class of linear programming problems in which the objective is to transport a single commodity from various origins to different destinations at a minimum cost.

(2) Formulation of a transportation problem. There are m plant locations (origins) and n distribution centres (destinations). The production capacity of the i th plant is a_i and the number of units required at the j th destination is b_j . The transportation cost of one unit from the i th plant to the j th destination is c_{ij} . Our objective is to determine the number of units to be transported from the i th plant to j th destination so that the total transportation cost is minimum.

Let x_{ij} be the number of units shipped from i th plant to j th destination, then the general transportation problem is :

$$\text{Minimize } Z = \sum_{i=1}^m \sum_{j=1}^n c_{ij} x_{ij}$$

subject to the constraints

$$x_{i1} + x_{i2} + \dots + x_{in} = a_i, \text{ for } i\text{th origin } (i = 1, 2, \dots, m)$$

$$x_{1j} + x_{2j} + \dots + x_{mj} = b_j, \text{ for } j\text{th destination } (j = 1, 2, \dots, n)$$

$$x_{ij} \geq 0.$$

Def. 1. The two sets of constraints will be consistent if

$$\sum_{i=1}^m a_i = \sum_{j=1}^n b_j$$

which is the condition for a transportation problem to have a *feasible solution*. Problems satisfying this condition are called *balanced transportation problems*.

2. A feasible solution to a transportation problem is said to be a *basic feasible solution* if it contains at the most $(m+n-1)$ strictly positive allocations, otherwise the solution will *degenerate*. If the total number of positive (non-zero) allocations is exactly $(m+n-1)$, then the basic feasible solution is said to be *non-degenerate*.

3. A feasible solution which minimizes the transportation cost is called an *optimal solution*. This problem is explicitly represented in the following *transportation table*:

		Distribution centres (Destinations)							
		1	2	\vdots	j	\vdots	n		
Plants (origins)	1	c_{11}	c_{12}	\vdots	c_{1j}	\vdots	c_{1n}	Supply	
	2	c_{21}	c_{22}	\vdots	c_{2j}	\vdots	c_{2n}	a_1	
	i	c_{i1}	c_{i2}	\vdots	c_{ij}	\vdots	c_{in}	a_2	
	m	c_{m1}	c_{m2}	\vdots	c_{mj}	\vdots	c_{mn}	a_i	
Demand		b_1	b_2	\vdots	b_j	\vdots	b_n	a_m	
								$\Sigma a_i = \Sigma b_j$	

The mn squares are called *cells*. The per unit cost c_{ij} of transporting from the i th origin to the j th destination is displayed in the *lower right side* of the (i, j) th cell. Any feasible solution is shown in the table by entering the value of x_{ij} in the *small square at the upper left side* of the (i, j) th cell. The various a 's and b 's are called *rim requirements*. The feasibility of a solution can be verified by summing the values of x_{ij} along the rows and down the columns.

Obs. 1. The special features of a transportation problem are that

- (i) the coefficients of all x_{ij} in the constraints are unity, and
- (ii) the total supply Σa_i = total demand Σb_j .

Obs. 2. The objective function and the constraints being all linear, the problem can be solved by simplex method. But the number of variables being large, there will be too many calculations. However, the coefficients of all x_{ij} in the constraints being unity, we can look for some technique which would be simpler than the simplex method.

34.15 WORKING PROCEDURE FOR TRANSPORTATION PROBLEMS

Step 1. Construct transportation table. Express the supply from the origins a_i , demand at destinations b_j and the unit shipping cost c_{ij} in the form of a matrix, known as transportation table. If the supply and demand are equal, the problem is *balanced*.

Step 2. Find the initial basic feasible solution. We find an initial allocation which satisfies the demand at each project site without violating the capacities of the plants (origins) and also meeting the non-negativity

restrictions. There are several methods for initial allocations e.g., North-West corner rule, Row minima method, Least cost method, Vogel's approximation method. The Vogel's approximation method (VAM) takes into account not only the least cost c_{ij} but also the costs that just exceed the least cost c_{ij} and therefore yields a better initial solution than obtained from other methods. As such we shall confine ourselves to VAM only which consists of the following steps :

- Display the difference between the least and the next to least costs in each row, by enclosing them in brackets to the right of the row. Similarly display the differences for each column within brackets below that column.
- Identify the row or column with the largest difference among all the rows and columns and allocate as much as possible under the rim requirements, to the lowest cost cell in that row or column. In case of a tie allocate to the cell associated with the lower cost.
If the greatest difference corresponds to i th row and c_{ij} is the lowest cost in the i th row, allocate as much as possible i.e., $\min(a_i, b_j)$ in the (i, j) th cell and cross off the i th row or the j th column.
- Recalculate the row and column differences for the reduced table and go to the previous step.
- Repeat the procedure till all the rim requirements are satisfied. Note the solution in the upper left corner small squares of the basic cells.

Step 3. Apply optimality check

In the above solution, the number of allocations must be ' $m + n - 1$ ', otherwise the basic solution degenerates.

Now to test for optimality, we apply the modified distribution (MODD) method and examine each unoccupied cell to determine whether making an allocation in it reduces the total transportation cost and then repeat this procedure until lowest possible transportation cost is obtained. This method consists of the following steps :

- Note the numbers u_i along the left and v_j along the top of the cost matrix such that their sums equal to the original costs of occupied cells i.e., solve the equations $[u_i + v_j = c_{ij}]$ starting initially with some $u_i = 0$.
- Compute the net evaluations $w_{ij} = u_i + v_j - c_{ij}$ for all the empty cells and enter them in upper right hand corners of the corresponding cells.
- Examine the sign of each w_{ij} . If all $w_{ij} \leq 0$, then the current basic feasible solution is optimal. If even one $w_{ij} > 0$, this solution is not optimal and we proceed further.

Step 4. Iterate towards optimal solution

- Choose the unoccupied cell with the largest w_{ij} and mark θ in it.
- Draw a closed path consisting of horizontal and vertical lines beginning and ending at θ -cell and having its other corners at the allocated cells.
- Add and subtract θ alternately to and from the transition cells of the loop subject to rim requirements. Assign a maximum value to θ so that one basic variable becomes zero and the other basic variables remain non-negative. Now the basic cell whose allocation has been reduced to zero leaves the basis.

Step 5. Return to step 3 and repeat the process until an optimal basic feasible solution is obtained.

Example 34.28. Solve the following transportation problem :

		Destination				Availability
		A	B	C	D	
Source	I	21	16	25	13	11
	II	17	18	14	23	13
III	33	27	18	41	19	
Requirement	6	10	12	15	43	

Solution. Consists of the following steps :

Step 1. Transportation table. Here the total availability and the total requirement being the same i.e. 43, the problem is balanced.

Step 2. Find the initial basic feasible solution. Following VAM, the differences between the smallest and next to the smallest costs in each row and each column are computed and displayed within brackets against the respective rows and columns (Table 1). The largest of these differences is (10) which is associated with the fourth column.

Table 1

21	16	25	11	13
17	18	14	23	
32	27	18	41	
6	10	12	15	
(4)	(2)	(4)	(10)	

Table 2

11(3)	17	18	14	4	23	13(3)
13(3)	32	27	18	41		19(9)
19(9)	6	10	12	4	+ 41	
	(15)	(9)	(4)	(18)		

Since c_{14} (= 13) is the minimum cost, we allocate $x_{14} = \min(11, 15) = 11$. This exhausts the availability of first row and therefore we cross it.

Table 3

6	17	18	14	9(3)
32	27	18		19(9)
6	10	12		
(15)	(9)	(4)		

Table 4

3	18	14	3(4)
27	18		19(9)
10	12		
(9)	(4)		

Table 5

7	12	18	19
7	12		
7	12		

The row and column differences are now computed for reduced table 2 and displayed within brackets. The largest of these is (18) which is against the fourth column. Since c_{14} (= 23) is the minimum cost, we allocate $x_{14} = \min(13, 4) = 4$.

This exhausts the availability of fourth column which we cross off. Proceeding in this way, the subsequent reduced transportation tables and differences for the remaining rows and columns are shown in Tables 3, 4 and 5.

Finally the initial basic feasible solution is as shown in Table 6.

Table 6

21	16	25	11	13
6	3		4	
17	18	14	23	
32	7	12	18	41

Table 7

$u_i \backslash v_j$	17	18	9	23
-10	(-)	(-)	(-)	11
0	6	3	(-)	4
9	(-)	7	12	(-)
	32	27	18	41

Step 3. Apply optimality check

As the number of allocations = $m + n - 1$ (i.e., 6), we can apply MODI method.

(i) We have $u_2 + v_1 = 17$, $u_2 + v_2 = 18$, $u_3 + v_2 = 27$

$$u_3 + v_3 = 18, u_1 + v_4 = 13, u_2 + v_4 = 23$$

Let $u_2 = 0$, then $v_1 = 17$, $v_2 = 18$, $u_3 = 9$, $v_3 = 9$, $v_4 = 23$, $u_1 = -10$.

(ii) Net evaluations $w_{ij} = (u_i + v_j) - c_{ij}$ for all empty cells are

$$w_{11} = -14, w_{12} = -8, w_{13} = -26, w_{23} = -5, w_{31} = -6, w_{34} = -9.$$

(iii) Since all the net evaluations are negative, the current solution is optimal. Hence the optimal allocation is given by

$$x_{14} = 11, x_{21} = 6, x_{22} = 3, x_{24} = 4, x_{32} = 7 \text{ and } x_{33} = 12.$$

∴ The optimal (minimum) transportation cost

$$= 11 \times 13 + 6 \times 17 + 3 \times 18 + 4 \times 23 + 7 \times 27 + 12 \times 18 = ₹ 796.$$

Example 34.29. A company has three cement factories located in cities 1, 2, 3 which supply cement to four projects located in towns 1, 2, 3, 4. Each plant can supply 6, 1, 10 truck loads of cement daily respectively and the daily cement requirements of the projects are respectively 7, 5, 3, 2 truck loads. The transportation costs per truck load of cement (in hundreds of rupees) from each plant to each project site are as follows :

		Project sites			
		1	2	3	4
Factories	1	2	3	11	7
	2	1	0	6	1
	3	5	8	15	9

Determine the optimal distribution for the company so as to minimize the total transportation cost.

Solution. Consists of the following steps :

Step 1. Construct transportation table. Express the supply from the factories, demands at sites and the unit shipping cost in the form of the following transportation table (Table 1). Here the supply being equal to the demand, the problem is balanced.

Table 1

		Project sites				Supply
		1	2	3	4	
Factories	1	2	3	11	7	6
	2	1	0	6	1	1
	3	5	8	15	9	10
Demand		7	5	3	2	17

Step 2. Find the initial basic feasible solution.

Using VAM, the initial basic feasible solution is as shown in Table 2. The transportation cost according to this route is given by

$$Z = ₹(1 \times 2 + 5 \times 3 + 1 \times 1 + 6 \times 5 + 3 \times 15 + 1 \times 9) \text{ times } 100 = ₹ 10,200.$$

Step 3. Apply optimality check.

As the numbers of allocations = $(m+n-1)$ i.e., 6, we can apply MODI method.

We now compute the net evaluations $w_{ij} = (u_i + v_j) - c_{ij}$ which are exhibited in Table 3. Since the net evaluations in two cells are positive, a better solution can be found.

Table 2

1	5		11	7
2		3		
			1	
1	0		6	1
6		3	1	
5	8		15	9
7	5	3	2	

Table 3

$u_i \setminus v_j$	2	3	12	6
0	1	5	(+)	(-)
-5	2	3	11	7
1	(-)	(-)	(+)	1
10	1	0	6	1
3	6	(-)	3	1
5	8	15		9

Step 4. Iterate towards optimal solution.

First iteration :

(a) Next basic feasible solution.

(i) Choose the unoccupied cell with the maximum w_{ij} . In case of a tie, select the one with lower original cost. In Table 3, cells (1, 3) and (2, 3) each have $w_{ij} = 1$ and out of these all (2, 3) has lower original cost 6, therefore we take this as the next basic cell and note 0 in it.

(ii) Draw a closed path beginning and ending at 0-cell. Add and subtract 0, alternately to and from the transition cells of the loop subject the rim requirements. Assign a maximum value to 0 so that one basic variable becomes zero and the other basic variables remain ≥ 0 . Now the basic cell whose allocation has been reduced to zero leaves the basis. This gives the second basic feasible solution (Table 5).

Table 4

1	5			
2		3	11	7
		0	1	-9
1		0	6	1
6		3	-9	1 + 6
	5	8	15	9

Table 5

1	5			
2		3	11	7
		0 = 1	1 - 1	
1		0	6	1
6		3 - 1	1 + 1	
	5	8	15	9

∴ Total transportation cost of this revised solution.

$$= \text{₹} (1 \times 2 + 5 \times 3 + 1 \times 6 + 6 \times 5 + 2 \times 15 + 2 \times 9) \text{ times } 100 = \text{₹} 10,100.$$

(b) *Optimality check.* As the number of allocations in table 5 = $m + n - 1$ (i.e., 6), we can apply MODI method. We compute the net evaluations which are shown in Table 6. Since the cell (1, 3) has a positive value, the second basic feasible solution is not optimal.

Table 6

v_j	2	3	12	6
u_i	1	5	(+)	(-)
0	2	3	11	7
	(-)	(-)	1	(-)
-6	1	0	6	1
	6	(-)	2	2
3	5	8	15	9

Table 7

1 - 1	5	0 = 1		
	2	3	11	7
	1	0	6	1
6 + 1		2 - 1	2	
	5	8	15	9

Second iteration :

(a) *Next basic feasible solution.* In the second basic feasible solution introduce the cell (1, 3) taking $\theta = 1$ and drop the cell (1, 1) giving Table 7. Thus we obtain the third basic feasible solution (Table 8).

Table 8

	5	1		
2		3	11	7
		1		
1		0	6	1
7		1	2	
	5	8	15	9

Table 9

v_j	1	3	11	5
u_i	(-)	5	1	(-)
0	2	3	11	7
	(-)	(-)	1	(-)
-5	1	0	6	1
	7	(-)	1	2
4	5	8	15	9

(b) *Optimality Check.* As the number of allocations in Table 8 = $m + n - 1$ (i.e., 6), we can apply MODI method.

We compute the net evaluations which are shown in Table 9. Since all the net evaluations are ≤ 0 , this basic feasible solution is optimal.

Thus the optimal transportation policy is as shown in Table 9 and the optimal transportation cost

$$= \text{₹} [5 \times 3 + 1 \times 11 + 1 \times 6 + 7 \times 5 + 1 \times 15 + 2 \times 9] \text{ times } 100 = \text{₹} 10,000.$$

34.16 DEGENERACY IN TRANSPORTATION PROBLEMS

When the number of basic cells in a non-transportation table, is less than ' $m + n - 1$ ' the basic solution degenerates. To remove the degeneracy, we assign a small positive value ϵ to as many zero-valued variables as may be necessary to complete ' $m + n - 1$ ' basic variables. The cells containing ϵ are then treated like other basic cells and the problem is solved in the usual way. The ϵ 's are kept till the optimum solution is attained. Then we let each $\epsilon \rightarrow 0$.

Example 34.30. Solve the following transportation problem:

		To						
		9	12	9	6	9	10	5
From	7	3	7	7	5	5	5	6
	6	5	9	11	3	11	2	2
	6	8	11	2	2	10	9	9
	4	4	6	2	4	2	22	

Solution. Consists of the following steps :

Step 1. Transportation table. The total supply and total demand being equal, the transportation problem is balanced.

Step 2. Find the initial basic feasible solution.

Using VAM, the initial basic feasible solution is as shown in Table 1.

Step 3. Apply optimality check. Since the number of basic cells is 8 which is less than $m + n - 1 = 9$, the basic solution degenerates. In order to complete the basis and thereby remove degeneracy, we require only one more positive basic variable. We select the variable x_{23} and allocate a small positive quantity ϵ to the cell (2, 3).

Table 1

		+							
		9	12	5	9	6	9	10	5
From	7	4		ϵ				2	$6 + \epsilon = 6$
	1			1					2
	6	5		9		11		3	11
	3				2		4		9
		4	4	$6 + \epsilon = 6$	2	2	2	2	+

We now compute the net evaluations $w_{ij} = (u_i + v_j) - c_{ij}$ which are exhibited in Table 2. Since all the net evaluations are ≤ 0 , the current solution is optimal. Hence the optimal allocation is

$$x_{13} = 5, x_{22} = 4, x_{26} = 2, x_{31} = 1, x_{33} = 1, x_{41} = 3, x_{44} = 2 \text{ and } x_{45} = 4.$$

\therefore The minimum (optimal) transportation cost

$$\begin{aligned} &= 5 \times 9 + 4 \times 3 + \epsilon \times 7 + 2 \times 5 + 1 \times 6 + 1 \times 9 + 3 \times 6 + 2 \times 2 + 4 \times 2 \\ &= 112 + 7\epsilon = ₹ 112 \text{ as } \epsilon \rightarrow 0. \end{aligned}$$

Table 2

v_j	4	3	7	0	0	5	
u_i	(-)	(-)	5	(-)	(-)	(-)	
2	9	12	9	6	9	10	
0	(-)	4	ϵ	(-)	(-)	2

3		(-)	(-)	2	4	(-)	
2	6	8	11	2	2	10	

PROBLEMS 34.9

1. Obtain an initial basic feasible solution to the following transportation problem :

		To				
		D	E	F	G	
From	A	11	13	17	14	250
	B	16	18	14	10	300
	C	21	24	13	10	400
		200	225	275	250	

2. Solve the following transportation problem :

Suppliers Consumers	A			B	C	Available
	I	II	III			
I	6	8	4			14
II	4	9	8			12
III	1	2	6			5
Required	6	10	15			31

3. Consider four bases of operations B_i and three targets T_j . The tons of bombs per aircraft from any base that can be delivered to any target are given in the following table :

B_i	T_j		
	1	2	3
1	8	6	5
2	6	6	6
3	10	8	4
4	8	6	4

The daily sortie capability of each of the four bases is 150 sorties per day. The daily requirement in sorties over each target is 200. Find the allocation of sorties from each base to each target which maximizes the total tonnage over all the three targets.

4. A company has factories F_1, F_2, F_3 which supply warehouses at W_1, W_2 and W_3 . Weekly factory capacities, weekly warehouse requirements and unit shipping costs (in rupees) are as follows :

Factories	Warehouses			Supply
	W_1	W_2	W_3	
F_1	16	20	12	200
F_2	14	8	18	160
F_3	26	24	16	90
Demand	180	120	150	450

Determine the optimal distribution for this company to minimize shipping costs.

5. A company is spending ₹ 1,000 on transportation of its units from plants to four distribution centres. The supply and demand of units, with unit cost of transportation are given below :

Plants	Distribution centres				Availabilities
	D_1	D_2	D_3	D_4	
P_1	19	30	50	12	7
P_2	70	30	40	60	10
P_3	40	10	60	20	18
Requirements	5	8	7	15	

What can be the maximum saving by optimal scheduling.

6. A departmental store wishes to stock the following quantities of a popular product in three types of containers :

Container type	1	2	3
Quantity	170	200	180
Dealer	1	2	3
Quantity	150	160	110

Tenders are submitted by four dealers who undertake to supply not more than the quantities shown below :

Dealer	1	2	3	4
Quantity	150	160	110	130

The store estimates that profit per unit will vary with the dealer as shown below :

Dealers → Container type ↓	1	2	3	4
1	8	9	6	3
2	6	11	5	10
3	3	8	7	9

Find the maximum profit of the store.

7. Obtain an optimum basic feasible solution to the following transportation problem :

		To			Available
		7	3	4	
From	2	1	3	2	3
	3	4	6	5	5
	4	1	5	10	
Demand					

8. A company has three plants at locations *A*, *B* and *C* which supply to warehouses located as *D*, *E*, *F*, *G* and *H*. Monthly plant capacities are 800, 500 and 900 units respectively. Monthly warehouse requirements are 400, 400, 500, 400 and 800 units respectively. Unit transportation costs in rupees are given below :

		To					Available
		<i>D</i>	<i>E</i>	<i>F</i>	<i>G</i>	<i>H</i>	
From	<i>A</i>	5	8	6	6	3	3
	<i>B</i>	4	7	7	6	6	6
	<i>C</i>	8	4	6	6	3	3

Determine an optimum distribution for the company in order to minimize the total transportation cost.

34.17 (1) ASSIGNMENT PROBLEM

An assignment problem is a special type of transportation problem in which the objective is to assign a number of origins to an equal number of destinations at a minimum cost (or maximum profit).

(2) **Formulation of an assignment problem.** There are *n* new machines M_i ($i = 1, 2, \dots, n$) which are to be installed in a machine shop. There are *n* vacant spaces S_j ($j = 1, 2, \dots, n$) available. The cost of installing the machine M_i at space S_j is c_{ij} rupees. Let us formulate the problem of assigning machines to spaces so as to minimize the overall cost.

Let x_{ij} be the assignment of machine M_i to space S_j i.e., let x_{ij} be a variable such that

$$x_{ij} = \begin{cases} 1, & \text{if } i\text{th machine is installed at } j\text{th space} \\ 0, & \text{otherwise} \end{cases}$$

Since one machine can only be installed at each space, we have

$$x_{i1} + x_{i2} + \dots + x_{in} = 1, \text{ for machine } M_i \quad (i = 1, 2, \dots, n)$$

$$x_{j1} + x_{j2} + \dots + x_{jn} = 1, \text{ for space } S_j \quad (j = 1, 2, \dots, n)$$

Also the total installation cost is $\sum_{i=1}^n \sum_{j=1}^n c_{ij} x_{ij}$.

Thus the assignment problem can be stated as follows :

Determine $x_{ij} \geq 0$ ($j = 1, 2, \dots, n$) so as to

$$\text{minimize } Z = \sum_{i=1}^n \sum_{j=1}^n c_{ij} x_{ij}$$

subject to the constraints $\sum_{i=1}^n x_{ij} = 1, j = 1, 2, \dots, n$ and $\sum_{j=1}^n x_{ij} = 1, i = 1, 2, \dots, n$.

This problem is explicitly represented by the following $n \times n$ cost matrix :

	S_1	S_2	S_3	...	S_n
M_1	c_{11}	c_{12}	c_{13}	...	c_{1n}
M_2	c_{21}	c_{22}	c_{23}	...	c_{2n}
M_3	c_{31}	c_{32}	c_{33}	...	c_{3n}
⋮	⋮	⋮	⋮	⋮	⋮
M_n	c_{n1}	c_{n2}	c_{n3}	...	c_{nn}

Obs. This assignment problem constitutes $n!$ possible ways of installing n machines at n spaces. If we enumerate all these $n!$ alternatives and evaluate the cost of each one of them and select the one with the minimum cost, the problem would be solved. But this method would be very slow and time consuming, even for small value of n and hence it is not at all suitable. However, a much more efficient method of solving such problems is available. This is the Hungarian method for solution of assignment problems which we describe below.

34.18 WORKING PROCEDURE TO SOLVE AN ASSIGNMENT PROBLEM

Step 1. Reduce the matrix. Subtract the smallest element of each row (of the given cost matrix) from all elements of that row. See if each row contains at least one zero. If not, subtract the smallest element of each column (not containing zero) from all the elements of that column. This gives the *reduced matrix*.

Step 2. Assign the zeros

(a) Examine rows (of the reduced matrix) successively until a row with exactly one unmarked zero is found. Make an assignment to this single zero by encircling it. Cross all other zeros in the column of this encircled zero, as these will not be considered for any future assignment. Continue in this way until all the rows have been examined.

(b) Now examine columns successively until a column with exactly one unmarked zero is found. Encircle this zero and make an assignment there. Then cross any other zero in its row. Continue in this way until all the columns have been examined.

In case, some rows or columns contain more than one unmarked zeros, encircle any unmarked zero arbitrarily and cross all other zeros in its row or column. Proceed in this way, till no zero is left unmarked.

Step 3. Apply optimality check.

Repeat step 2 (a) and (b) until one of the following occurs :

- (i) If no row or no column is without assignment (encircled zero), then the current assignment is optimal.
- (ii) If there is some row and/or column without an assignment, then the current assignment is not optimal and we go to next step.

Step 4. Find minimum number of lines crossing all zeros.

- (a) Tick (✓) the rows which do not have assignments.
- (b) Tick (✓) the columns (not already marked) which have zeros in the ticked row.
- (c) Tick (✓) the rows (not already marked) which have assignments in ticked columns.

Repeat (b) and (c) until no more marking is required.

- (d) Draw lines through all unticked rows and ticked columns. If the number of these lines is equal to the order of the matrix then it is an optimal solution otherwise not.

Step 5. Iterate towards optimal solution.

Select the smallest element and subtract it from all uncovered elements. Add this smallest element to every element lying at the intersection of two lines. The resulting matrix is the second basic feasible solution.

Step 6. Go to step 2 and repeat the procedure until the optimal solution is attained.

Example 34.31. Four jobs are to be done on four different machines. The cost (in rupees) of producing i th job on the j th machine is given below :

		Machines			
		M_1	M_2	M_3	M_4
Jobs	J_1	15	11	13	15
	J_2	17	12	12	13
	J_3	14	15	10	14
	J_4	16	13	11	17

Assign the jobs to different machines so as to minimize the total cost.

Solution. Consists of the following steps :

Step 1. Reduce the matrix. Subtract the smallest element 11 of row 1 from all its elements. Similarly subtract 12, 10 and 11 from rows 2, 3 and 4 respectively. The resulting matrix is as shown in Table 1. Columns 1 and 4 do not have any zero element. Subtract the smallest element 4 of Col. 1 from all its elements and element 1 from all elements of Col. 4. The reduced matrix is as given in Table 1.

Table 1

	M_1	M_2	M_3	M_4
J_1	4	0	2	4
J_2	5	0	0	1
J_3	4	5	0	4
J_4	5	2	0	6

Table 2

	M_1	M_2	M_3	M_4
J_1	0	0	2	3
J_2	1	X	X	0
J_3	0	5	X	3
J_4	1	2	0	5

Step 2. Assign the zeros. Row 4 has a single unmarked zero in Col. 3. Encircle it and cross all other zeros in Col. 3. Row 3 has a single unmarked zero in Col. 1. Encircle it and cross the other zero in col. 1. Row 1 has a single unmarked zero in Col. 2. Encircle it and cross the other zero in Col. 2. Finally row 2 has a single unmarked zero in Col. 4. Encircle it (Table 2).

Step 3. Apply optimality check. Since we have one encircled zero in each row and in each column, this gives the optimal solution.

∴ The optimal assignment policy is

Job 1 to machine 2, Job 2 to machine 4, Job 3 to machine 1, Job 4 to machine 3,
and the minimum assignment cost = ₹ (11 + 13 + 14 + 11) = ₹ 49.

Example 34.32. A marketing manager has 5 salesmen and 5 sales districts. Considering the capabilities of the salesmen and the nature of districts, the marketing manager estimates that sales per month (in hundred rupees) for each salesman in each district would be as follows :-

		Sales districts				
		A	B	C	D	E
Salesman	1	32	38	40	28	40
	2	40	24	28	21	36
	3	41	27	33	30	37
	4	22	38	41	36	36
	5	29	33	40	35	39

Find the assignment of salesmen to districts that will result in maximum sales.

(Madras, 2000)

Solution. Consists of the following steps :

Step 1. Reduce the matrix. Convert the given maximization problem into a minimization problem, by making all the profits negative, since $\max Z = \min (-Z)$. Then subtract the smallest element of each row from the elements of that row. Now subtract the smallest element of each col. (not containing zero) from the elements of that column. This gives the reduced matrix (Table 1).

Table 1

8	0	X	7	0
0	14	12	14	4
0	12	8	6	4
19	1	0	X	5
11	5	0	X	1

Table 2

12	0	0	7	0
0	10	8	10	0
0	8	4	2	0
23	1	0	0	5
15	5	0	0	1

Step 2. Assign the zeros. Rows 2 and 3 have each a single unmarked zero in Col. 1. Encircle these. Columns 2 and 5 have each a single unmarked zero in row 1. Encircle these and cross the zero in row 1. Columns 3 and 4 have each unmarked zeros. Encircle the zeros in each of the rows 4 and 5 as shown in Table 1 and cross other zeros.

Step 3. Apply optimality check. As col. 4 is without assignment, this solution is not optimal. Therefore we go to next step.

Step 4. Find minimum number of lines crossing all zeros. Draw the least number of horizontal and vertical (dotted) lines which cover all the zeros. Since there are four dotted lines which are less than the order of the cost matrix (= 5), we got to step 5.

Step 5. Iterate towards optimal solution. Select the smallest element in the Table 1, not covered by the dotted lines. Such an element is 4 which lies at two different positions. Selecting the elements that lies at position (3, 5) arbitrarily, subtract it from all the uncovered elements of the cost matrix (Table 1) and add the same to the elements lying at the intersection of two dotted lines. Now draw more minimum number of dotted lines so as to cover the new zero. Here we draw such a line in Col. 5 (Table 2).

Table 3

	A	B	C	D	E
1	0	X			
2	0				X
3	X				0
4			0	X	
5			X	0	

Now, since the number of dotted lines is equal to the order for the cost matrix, the optimal solution is attained.

Finally, to determine this optimal assignment, we consider only the zero elements (Table 3) :

- (i) Examine successively the rows with exactly one zero. There is no such row.
- (ii) Examine successively the columns with exactly one zero. Col. 2 has one zero, encircle it and cross all zeros of row 1.

(iii) Encircle arbitrarily the zero in position (2, 1) and cross all zeros in row 2 and Col. 1. Then encircle the unmarked zero in row 3. Now encircle arbitrarily the zero in position (4, 3) and cross all zeros in row 4 and Col. 3. Finally encircle the remaining unmarked zero in row 5.

Now each row and each column has one encircled zero, therefore the optimal assignment policy is :

Salesman 1 to district B, 2 to A, 3 to E, 4 to C and 5 to D.

Hence the maximum sales = ₹ (38 + 40 + 37 + 41 + 35) × 100 = ₹ 19,100.

PROBLEMS 34.10

1. A firm plans to begin production of three new products on its three plants. The unit cost of producing i at plant j is as given below. Find the assignment that minimizes the total unit cost.

		Plant		
		1	2	3
Product	1	10	8	12
	2	18	6	14
	3	6	4	2

2. Solve the following assignment problem :

		1	2	3	4
A	10	12	19	11	
	5	10	7	8	
	12	14	13	11	
	8	15	11	9	

3. A machine tool company decides to make four sub-assemblies through four contractors. Each contractor is to receive only one sub-assembly. The cost of each sub-assembly is determined by the bids submitted by each contractor and is shown in table below (in hundreds of rupees). Assign different assemblies to contractors so as to minimize the total cost.

		Contractor			
		A	B	C	D
Sub-assembly	I	15	13	14	17
	II	11	12	15	13
	III	18	12	10	11
	IV	15	17	14	16

4. Four professors are each capable of teaching any one of the four different courses. Class preparations time in hours for different topics varies from professor to professor and is given in the table below. Each professor is assigned only one course. Find the assignment policy schedule so as to minimize the total course preparation time for all courses.

Prof.	L.P.	Queuing Theory	Dynamic Programming	Regression analysis
A	2	10	9	7
B	15	4	14	8
C	13	14	16	11
D	3	15	13	8

5. Consider the problem of assigning four working labour units to four jobs. The assignment costs in thousands of rupees are given by the following matrix.

Labour unit	Job			
	I	II	III	IV
L_1	42	35	28	21
L_2	30	25	20	15
L_3	30	25	20	15
L_4	24	20	16	12

Find the optimal assignment.

6. A company has six jobs to be processed by six mechanics. The following table gives the return in rupees when the i th job is assigned to the j th mechanic. How should the jobs be assigned to the mechanics so as to maximize the overall return?

Mechanic ↓	Job					
	I	II	III	IV	V	VI
1	9	22	58	11	19	27
2	43	78	72	50	63	48
3	41	28	91	37	45	33
4	74	42	27	49	39	32
5	36	11	57	22	25	18
6	13	56	53	31	17	28

34.19 OBJECTIVE TYPE OF QUESTIONS

PROBLEMS 34.11

Fill up the blanks in the following questions.

1. Infeasibility in a linear programming problem means
2. The significance of the $(Z_j - C_j)$ row in the simplex solution procedure is that
3. The duality principle states that
4. The difference between the transportation problem and the assignment problem is
5. The special features of a transportation problem are
6. The canonical form of an L.P.P. is such that
7. The dual problem of the L.P.P. :

Max. $Z = 4x_1 + 9x_2 + 2x_3$
 subject to $2x_1 + 3x_2 + 2x_3 \leq 7$, $3x_1 - 2x_2 + 4x_3 = 5$, $x_1, x_2, x_3 \geq 0$, is

8. The optimality and feasibility conditions related with Dual simplex method are
9. Feasible and basic solutions related with a transportation problem are
10. A transportation problem is

					Supply	
		2	3	11	4	15
Demand		5	6	8	7	20
		10	5	12	8	

Its linear programming problem is

11. The basic feasible solutions of $2x_1 + x_2 + 4x_3 = 11$, $3x_1 + x_2 + 5x_3 = 14$ are
12. A slack variable is defined as
13. The advantage of dual simplex method is
14. If the total availability is equal to the total requirements, the transportation problem is called
15. An artificial variable is that
16. Two conditions on which the simplex method is based are
17. A feasible solution which minimizes the transportation cost is called an solution.
18. The dual problem of : Maximize $5x_1 + 6x_2$ subject to $x_1 + 2x_2 = 5$, $-x_1 + 4x_2 \geq 3$, x_1 unrestricted and $x_2 \geq 0$, is
19. For a balanced transportation problem with 3 rows and 3 columns, the number of basic variables will be
20. Using graphical method, Max. $Z = 5x_1 + 3x_2$ subject to $5x_1 + 2x_2 \leq 10$, $3x_1 + 5x_2 \leq 15$, $x_1, x_2 \geq 0$, is
21. In a L.P. problem, unbounded solution is that
22. Degeneracy in a transportation problem is resolved by
23. A basic solution is said to be non-degenerate in L.P.P. when
24. The dual of the problem Max. $Z = 2x_1 + x_2$ subject to $-x_1 + 2x_2 \leq 2$, $x_1 + x_2 \leq 4$, $x_1 \leq 3$, $x_1, x_2 \geq 0$ is
25. The two methods used to find the initial solution of a transportation problem are
26. Constraints involving 'equal to sign' do not require use of or variables.

35.1 INTRODUCTION

The calculus of variations is a powerful technique for the solution of problems in dynamics of rigid bodies, optimization of orbits and vibration problems. The subject primarily concerns with finding maximum or minimum value of a definite integral involving a certain function. It is something beyond finding stationary values of a given function. Only an elementary exposition of the subject is given here with the sole aim of introducing the student to a topic whose importance is fast growing in science and engineering.

Before proceeding further, the student should revise § 5.12 concerning maxima and minima of functions of several variables.

35.2 FUNCTIONALS

Consider the problem of finding a curve through two points (x_1, y_1) and (x_2, y_2) whose length is a minimum (Fig. 35.1). It is same as determining the curve $y = y(x)$ for which $y(x_1) = y_1$, $y(x_2) = y_2$ such that $\int_{x_1}^{x_2} \sqrt{1 + y'^2} dx$ is a minimum.

In general terms, we wish to find the curve $y = y(x)$ where $y(x_1) = y_1$ and $y(x_2) = y_2$ such that for a given function $f(x, y, y')$,

$$\int_{x_1}^{x_2} f(x, y, y') dx \text{ is a stationary value or an extremum.} \quad \dots(1)$$

An integral such as (1), which assumes a definite value for functions of the type $y = y(x)$ is called a **functional**.

In differential calculus, we deal with the problems of maxima and minima of functions. The calculus of variations is however, concerned with maximizing or minimizing functionals.

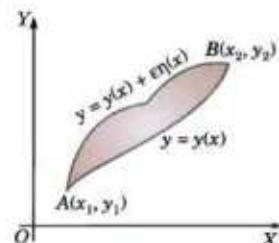

Fig. 35.1

35.3 EULER'S EQUATION

A necessary condition for

$$I = \int_{x_1}^{x_2} f(x, y, y') dx \text{ to be an extremum is that}$$

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 0$$

This is called *Euler's equation*.

Proof. Let $y = y(x)$ be the curve joining points $A(x_1, y_1), B(x_2, y_2)$ which makes I an extremum. Let

$$y = y(x) + \varepsilon \eta(x) \quad \dots(1)$$

be a neighbouring curve joining these points so that at A , $\eta(x_1) = 0$ and at B , $\eta(x_2) = 0$.
... (2)

The value of I along (1) is $I = \int_{x_1}^{x_2} f[x, y(x) + \varepsilon \eta(x), y'(x) + \varepsilon \eta'(x)] dx$

This being a function of ε , is a maximum or minimum for $\varepsilon = 0$, when

$$\frac{dI}{d\varepsilon} = 0 \text{ at } \varepsilon = 0 \quad \dots(3)$$

\therefore Differentiating I under the integral sign by Leibnitz's rule (p. 139), we have

$$\frac{dI}{d\varepsilon} = \int_{x_1}^{x_2} \left(\frac{\partial f}{\partial x} \frac{\partial x}{\partial \varepsilon} + \frac{\partial f}{\partial y} \frac{\partial y}{\partial \varepsilon} + \frac{\partial f}{\partial y'} \frac{\partial y'}{\partial \varepsilon} \right) dx \quad \dots(4)$$

But ε being independent of x , $\frac{\partial x}{\partial \varepsilon} = 0$. Also from (1), $\frac{\partial y}{\partial \varepsilon} = \eta(x)$ and $\frac{\partial y'}{\partial \varepsilon} = \eta'(x)$.

Substituting these values in (4), we get $\frac{dI}{d\varepsilon} = \int_{x_1}^{x_2} \left[\frac{\partial f}{\partial y} \eta(x) + \frac{\partial f}{\partial y'} \eta'(x) \right] dx$

Integrating the second term on the right by parts, we have

$$\begin{aligned} \frac{dI}{d\varepsilon} &= \int_{x_1}^{x_2} \frac{\partial f}{\partial y} \eta(x) dx + \left[\left. \frac{\partial f}{\partial y'} \eta(x) \right|_{x_1}^{x_2} - \int_{x_1}^{x_2} \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) \eta(x) dx \right] \\ &= \int_{x_1}^{x_2} \left[\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) \right] \eta(x) dx \end{aligned} \quad [\text{By (2)}]$$

Since this has to be zero by (3),

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 0 \quad \dots(I)$$

which is the desired *Euler's equation*.

Obs. 1. Other forms of Euler's equation.

$$\begin{aligned} (\text{a}) \text{ Since } f \text{ is a function of } x, y, y', \text{ we have } \frac{df}{dx} &= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} \frac{dy}{dx} + \frac{\partial f}{\partial y'} \frac{dy'}{dx} \\ &= \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' + \frac{\partial f}{\partial y'} y'' \end{aligned} \quad \dots(5)$$

$$\text{and } \frac{d}{dx} \left(y' \frac{\partial f}{\partial y'} \right) = y' \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) + \frac{\partial f}{\partial y'} y'' \quad \dots(6)$$

$$\text{Subtracting (6) from (5), we get } \frac{df}{dx} - \frac{d}{dx} \left(y' \frac{\partial f}{\partial y'} \right) = \frac{\partial f}{\partial x} + \frac{\partial f}{\partial y} y' - y' \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right)$$

$$\text{or } \frac{d}{dx} \left(f - y' \frac{\partial f}{\partial y'} \right) - \frac{\partial f}{\partial x} = y' \left\{ \frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) \right\} = 0 \quad [\text{By (I)}]$$

$$\text{Hence } \frac{d}{dx} \left(f - y' \frac{\partial f}{\partial y'} \right) - \frac{\partial f}{\partial x} = 0 \quad \dots(\text{II})$$

which is another form of (I).

$$(\text{b}) \text{ Again since } \frac{\partial f}{\partial y'} \text{ is also a function of } x, y, y', \text{ say : } \psi(x, y, y'),$$

$$\therefore \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = \frac{d\psi}{dx} = \frac{\partial \psi}{\partial y} + \frac{\partial \psi}{\partial y} \frac{dy}{dx} + \frac{\partial \psi}{\partial y'} \frac{dy'}{dx}$$

$$= \frac{\partial}{\partial x} \left(\frac{\partial f}{\partial y'} \right) + \frac{\partial}{\partial y} \left(\frac{\partial f}{\partial y'} \right) y' + \frac{\partial}{\partial y'} \left(\frac{\partial f}{\partial y'} \right) y'' = \frac{\partial^2 f}{\partial x \partial y'} + y' \frac{\partial^2 f}{\partial y \partial y'} + y'' \frac{\partial^2 f}{\partial y'^2}$$

Substituting this in (I), we get $\frac{\partial f}{\partial y} - \frac{\partial^2 f}{\partial x \partial y'} - y' \frac{\partial^2 f}{\partial y \partial y'} - y'' \frac{\partial^2 f}{\partial y'^2} = 0$ (V.T.U., 2001) ... (III)

which is an extended form of (I).

Obs. 2. The above problem can easily be extended to the integral

$$= \int_{x_1}^{x_2} f(x, y_1, y_2, \dots, y_n, y'_1, y'_2, \dots, y'_n) dx$$

involving n functions y_1, y_2, \dots, y_n of x . Then the necessary condition for this integral to be stationary is

$$\frac{\partial f}{\partial y_i} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'_i} \right) = 0, \quad i = 1, 2, \dots, n \quad \dots (IV)$$

These are Euler's equations for the n functions.

35.4 SOLUTIONS OF EULER'S EQUATION

Every solution of the Euler's equation which satisfies the boundary conditions, is called an *extremal* or a *stationary function* of the problem. The extremal can easily be obtained in the following cases :

(1) When f is independent of x

We have $\partial f / \partial x = 0$ and Euler's equation (II) above becomes $\frac{d}{dx} \left(f - y' \frac{\partial f}{\partial y'} \right) = 0$

Integrating, we get $f - y' \frac{\partial f}{\partial y'} = \text{constant}$. This directly gives a solution of Euler's equation.

(2) When f is independent of y

We have $\partial f / \partial y = 0$ and Euler's equation (I) reduces to $\frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 0$

Integrating $\frac{\partial f}{\partial y'} = \text{constant}$ which gives a solution directly.

(3) When f is independent of y' .

We have $\partial f / \partial y' = 0$ and the equation (I) becomes $\frac{\partial f}{\partial y} = 0$ which gives the desired solution.

(4) When f is independent of x and y

We have $\frac{\partial f}{\partial x} = 0, \frac{\partial f}{\partial y} = 0$ and $\frac{\partial^2 f}{\partial x \partial y'} = 0, \frac{\partial^2 f}{\partial y \partial y'} = 0$.

Then the equation (III) above becomes $y'' \frac{\partial^2 f}{\partial y'^2} = 0$.

If $\frac{\partial^2 f}{\partial y'^2} \neq 0$, it reduces to $y'' = 0$ which gives a solution of the form $y = ax + b$.

Example 35.1. Find the extremals of the functional $\int_{x_1}^{x_2} (y'^2 / x^3) dx$.

(V.T.U., 2003)

Solution. We have $f = y'^2 / x^3$ which is independent of y i.e., $\partial f / \partial y = 0$.

Also $\frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = \frac{d}{dx} \left(\frac{2y'}{x^3} \right) = 2 \frac{x^3 y'' - y' \cdot 3x^2}{x^6} = \frac{2}{x^4} (xy'' - 3y')$

\therefore Euler's equation reduces to $\frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 0$

i.e., $\frac{2}{x^4} (xy'' - 3y') = 0$ or $y''/y' = 3/x$

Integrating both sides, $\int \frac{y''}{y'} dy = 3 \int \frac{dx}{x} + \log c$

i.e., $\log y' = 3 \log x + \log c \quad \text{or} \quad y' = cx^3$

Hence

$$y = cx^4/4 + c' \quad \text{or} \quad y = c_1 x^4 + c_2$$

This is the required extremal.

Example 35.2. Prove that the shortest distance between two points in a plane is a straight line.

(V.T.U., 2003 S ; Bhopal, 2003)

Solution. Let $A(x_1, y_1)$ and $B(x_2, y_2)$ be the given points and s the arc length of a curve connecting them (Fig. 35.2). Then

$$s = \int_{x_1}^{x_2} ds = \int_{x_1}^{x_2} \sqrt{1+y'^2} dx$$

Now s will be minimum if it satisfies Euler's equation

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 0$$

Here $f = \sqrt{1+y'^2}$ which is independent of y i.e., $\partial f / \partial y = 0$

$$\therefore \frac{d}{dx} \left\{ \frac{\partial}{\partial y'} \sqrt{1+y'^2} \right\} = 0 \quad \text{or} \quad \frac{d}{dx} \left\{ \frac{y'}{\sqrt{1+y'^2}} \right\} = 0.$$

\therefore On integration, we have $y'/\sqrt{1+y'^2} = \text{constant}$ $y' = \text{constant}$, m say.

Integrating, we get $y = mx + c$, which is a straight line, the constants m and c are determined from the fact that the straight line passes through A and B .

Example 35.3. Find the curve passing through the points (x_1, y_1) and (x_2, y_2) which when rotated about the x -axis gives a minimum surface area. (V.T.U., 2009)

Solution. In Fig. 35.3, the surface area = $\int_{x_1}^{x_2} 2\pi y \, ds$

$$= 2\pi \int_{x_1}^{x_2} y \sqrt{1+y'^2} dx. \text{ This has to be minimum.}$$

Since $f = y \sqrt{1+y'^2}$ is independent of x , therefore, Euler's equation reduces to

$$f - y' \frac{\partial f}{\partial y'} = \text{constant}, c : \text{say} \quad [\text{By } \S 35.4 (1)]$$

$$\therefore y \sqrt{1+y'^2} - y' \frac{\partial}{\partial y'} \left\{ y \sqrt{1+y'^2} \right\} = c$$

$$\text{i.e.,} \quad y \sqrt{1+y'^2} - y' \left\{ \frac{y}{2} (1+y'^2)^{-1/2} \cdot 2y' \right\} = c$$

$$\text{or} \quad y/\sqrt{1+y'^2} = c \quad \text{or} \quad y' = \frac{dy}{dx} = \frac{\sqrt{y^2 - c^2}}{c}$$

Separating the variables and integrating, we have

$$\int \frac{dy}{\sqrt{y^2 - c^2}} = \int \frac{dx}{c} + c' \quad \text{or} \quad \cosh^{-1} \left(\frac{y}{c} \right) = \frac{x+a}{c}$$

$$\text{i.e.,} \quad y = c \cosh \left(\frac{x+a}{c} \right)$$

which is a *catenary*. The constants a and c are determined from the points (x_1, y_1) and (x_2, y_2) .

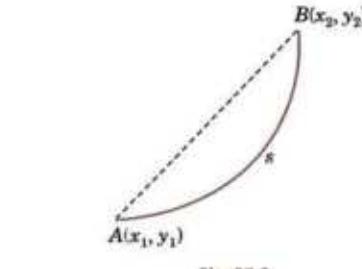

Fig. 35.2

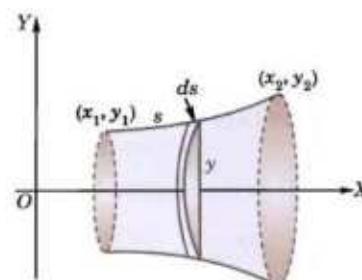

Fig. 35.3

Obs. This problem is also important in connection with *soap films* which are known to have shapes with minimum surface areas.

Example 35.4. Find the path on which a particle in the absence of friction, will slide from one point to another in the shortest time under the action of gravity. (V.T.U., 2004)

Solution. Let the particle start sliding on the curve OP_1 from O with zero velocity (Fig. 35.4). At time t , let the particle be $P(x, y)$ such that arc $OP = s$.

By the principle of work and energy, we have

K.E. at P – K.E. at O = Work done in moving the particle from O to P .

$$\frac{1}{2}m\left(\frac{ds}{dt}\right)^2 - 0 = mgy$$

$$\text{or } \frac{ds}{dt} = \sqrt{(2gy)} \quad \dots(i)$$

Thus the time taken by the particle to move from O to P_1 is

$$T = \int_0^T dt = \int_0^{x_1} \frac{ds}{\sqrt{(2gy)}} = \frac{1}{\sqrt{(2g)}} \int_0^{x_1} \frac{\sqrt{(1+y'^2)}}{\sqrt{y}} dx$$

Here $f = \sqrt{(1+y'^2)/y}$ is independent of x .

∴ Euler's equation reduces to $f - y' \frac{\partial f}{\partial y'} = \text{constant}, c : \text{say}$

$$\text{i.e., } \frac{\sqrt{(1+y'^2)}}{\sqrt{y}} - y' \frac{\partial}{\partial y'} \left[\frac{\sqrt{(1+y'^2)}}{\sqrt{y}} \right] = c \quad \text{or} \quad \frac{\sqrt{(1+y'^2)}}{\sqrt{y}} - y' \left[\frac{y'}{\sqrt{(1+y'^2)}\sqrt{y}} \right] = c$$

$$\text{or } \sqrt{|y(1+y'^2)|} = 1/c = \sqrt{a}, \text{ say.}$$

$$\text{Solving for } y', \text{ we have } y' = \frac{dy}{dx} = \sqrt{\left(\frac{a-y}{y}\right)}$$

Separating the variables and integrating, we get

$$\int_0^x dx = \int_0^y \sqrt{\left(\frac{y}{a-y}\right)} dy \quad [\text{Put } y = a \sin^2 \theta] \quad \dots(i)$$

$$\begin{aligned} \text{or } x &= \int_0^\theta \sqrt{\left(\frac{a \sin^2 \theta}{a - a \sin^2 \theta}\right)} 2a \sin \theta \cos \theta d\theta \\ &= a \int_0^\theta 2 \sin^2 \theta d\theta = a \int_0^\theta (1 - \cos 2\theta) d\theta = \frac{a}{2} (2\theta - \sin 2\theta) \end{aligned} \quad \dots(ii)$$

Writing $a/2 = b$ and $2\theta = \phi$, equations (ii) and (i) become $x = b(\phi - \sin \phi)$, $y = b(1 - \cos \phi)$ which is a cycloid. The constant b is found from the fact that the curve goes through (x_1, y_1) .

Obs. This is the well-known brachistochrone problem which derives its name from the Greek words 'brachistos' meaning shortest and 'chronos' meaning time. It was proposed by John Bernoulli in 1696 and its solution formed the basis for the study of the 'Calculus of Variations'. (V.T.U., 2006)

Example 35.5. Find the curves on which the functional $\int_0^1 [(y')^2 + 12xy] dx$ with $y(0) = 0$ and $y(1) = 1$ can be extremised. (V.T.U., 2010)

Solution. We have

$$f = y'^2 + 12xy$$

$$\therefore \frac{\partial f}{\partial y} = 12x; \frac{\partial f}{\partial y'} = 2y'; \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 2y''$$

Hence the Euler's equation $\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 0$ becomes

$$12x - 2y'' = 0 \quad \text{i.e., } y'' = 6x \quad \dots(i)$$

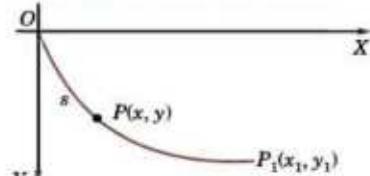

Fig. 35.4

Integrating (i), $y' = 3x^2 + C$... (ii) and $y = x^3 + Cx + C'$... (iii)

Using the boundary conditions, when $x = 0, y = 0$ (iii) gives $C' = 0$.

When $x = 1, y = 1$, (iii) again gives $C = 0$.

Hence (iii) reduces to $y = x^3$ which is the only curve on which extremum can be attained.

Example 35.6. On which curve the functional $\int_0^{\pi/2} (y'^2 - y^2 + 2xy) dy$ with $y(0) = 0$ and $y(\pi/2) = 0$, be extremized? (V.T.U., 2006)

Solution. Let $f = y'^2 - y^2 + 2xy$ so that $\frac{\partial f}{\partial y'} = 0 - 2y + 2x$

and

$$\frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = \frac{d}{dx} (2y') = 2y''$$

\therefore Euler's equation $\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 0$ becomes

$$-2y + 2x - 2y'' = 0 \quad \text{or} \quad y'' + y = x \quad \text{or} \quad (D^2 + 1)y = x$$

Its A.E. $D^2 + 1 = 0$ gives $D = \pm i$.

\therefore C.F. = $c_1 \cos x + c_2 \sin x$

and

$$\text{P.I.} = \frac{1}{D^2 + 1} x = (1 + D^2)^{-1} x = (1 - D^2) x = x$$

Thus

$$y = c_1 \cos x + c_2 \sin x + x \quad \dots(i)$$

Using boundary conditions : when $x = 0, y = 0$, (i) gives $c_1 = 0$;

when $x = \pi/2, y = 0$, (i) gives $0 = c_2 + \pi/2$, i.e., $c_2 = -\pi/2$.

Hence (i) reduces to $y = x - \frac{\pi}{2} \sin x$, which is the only curve on which the given functional can be extremized.

Example 35.7. Solve the variational problem

$$5 \int_1^2 [x^2(y')^2 + 2y(x+y)] dx = 0, \text{ given } y(1) = y(2) = 0. \quad (\text{V.T.U., 2006})$$

Solution. Let $f = x^2(y')^2 + 2xy + 2y^2$ so that $\frac{\partial f}{\partial y} = 2x + 4y, \frac{\partial f}{\partial y'} = 2x^2y'$

\therefore Euler's equation $\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 0$ becomes

$$2x + 4y - \frac{d}{dx} (2x^2y') = 0 \quad \text{or} \quad 2x + 4y - (2x^2y'' + 4xy') = 0$$

or

$x^2y'' + 2xy' - 2y = x$. This is Cauchy's homogeneous linear (§ 13.9)

Putting $x = e^t$, it reduces to $(D^2 + D - 2)y = e^t$.

Its solution is $y = c_1 e^t + c_2 e^{-2t} + \frac{1}{3} te^t$ or $y = c_1 x + \frac{c_2}{x^2} + \frac{1}{3} x \log x$... (i)

Since $y(1) = 0$, we have $c_1 + c_2 = 0$

and $y(2) = 0$ gives $0 = 2c_1 + \frac{1}{4}c_2 + \frac{2}{3} \log 2$

Solving these equations, we get $c_1 = -c_2 = \frac{-8}{21} \log 2$.

Putting the values of c_1 and c_2 in (i), we get

$$y = \frac{1}{21} (8 \log 2 (x^{-2} - x) + 7x \log x)$$

which is the required solution.

35.5 GEODESICS

A geodesic on a surface is a curve along which the distance between any two points of the surface is a minimum. To find the geodesics on a surface is a variational problem involving the conditional extremum. This problem was first studied by Jacob Bernoulli in 1698 and its general method of solution was given by Euler.

Example 35.8. Show that the geodesics on a plane are straight lines.

(V.T.U., 2009)

Solution. Let $y = y(x)$ be a curve joining the points $A(x_1, y_1)$ and $B(x_2, y_2)$ in the xy -plane. Then the length of a curve joining A and B is given by

$$s = \int_A^B \frac{ds}{dx} dx = \int_{x_1}^{x_2} \sqrt{1 + (dy/dx)^2} dx \quad \text{i.e., } s = \int_{x_1}^{x_2} \sqrt{1 + y'^2} dx$$

The geodesic on the xy -plane is the curve $y = y(x)$ for which s is minimum.

We have $f(x, y, y') = \sqrt{1 + y'^2}$ which depends on y' only. Hence the Euler's equation.

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) = 0 \text{ yields}$$

$$\frac{d}{dx} \left\{ \frac{2y'}{2\sqrt{1+y'^2}} \right\} = 0 \quad \text{i.e., } y'' \sqrt{1+y'^2} - \frac{y'_2 2y'y''}{2\sqrt{1+y'^2}} = 0$$

$$\text{i.e., } y''(1+y'^2) - y'^2 y''' = 0 \quad \text{i.e., } \frac{d^2 y}{dx^2} = 0$$

Integrating twice, we get $y = c_1 x + c_2$
which is a straight line.

Hence the geodesics on a plane are straight lines.

Example 35.9. Find the geodesics on a right circular cylinder of radius a .

Solution. In cylindrical coordinates (ρ, ϕ, z) we have

$$x = r \cos \phi, y = r \sin \phi, z = z. \quad (p. 357)$$

\therefore The element of arc on a right circular cylinder of radius a , is given by

$$ds^2 = (dx)^2 + (dy)^2 + (dz)^2 = (d\rho)^2 + (\rho d\phi)^2 + dz^2 = a^2 d\phi^2 + dz^2$$

$$\text{or } ds = \sqrt{a^2 + (dz/d\phi)^2} . d\phi \quad \text{or } s = \int_{\phi_1}^{\phi_2} \sqrt{a^2 + z'^2} d\phi \quad \dots(i)$$

Now the geodesic for the given cylinder is the curve for which s is minimum. Here $f = \sqrt{a^2 + z'^2}$, which is a function of ϕ and z' while z is absent.

\therefore Euler's equation for the functional (i) reduces to

$$\frac{\partial f}{\partial z'} = \text{constant} \quad \text{or} \quad \frac{z'}{\sqrt{a^2 + z'^2}} = c, \text{ say.}$$

This simplifies to $(z')^2 = \text{constant}$ or $dz/d\phi = c_1$, say.

Integrating, $z = c_1 \phi + c_2$

This is the desired geodesics on a circular cylinder which is a circular helix. (Example 8.3, p. 318)

Example 35.10. Show that the geodesics on a sphere of radius a are its great circles.

Solution. In spherical coordinates (r, θ, ϕ) , we have

$$x = r \sin \theta \cos \phi, y = r \sin \theta \sin \phi, z = r \cos \theta. \quad (p. 359) \quad \dots(i)$$

\therefore The arc element on a sphere of radius a , is given by

$$ds^2 = dr^2 + (r d\theta)^2 + (r \sin \theta d\phi)^2 = a^2 d\theta^2 + (a \sin \theta)^2 d\phi^2$$

$$\therefore r = a, dr = 0$$

$$\text{or } ds = a \sqrt{1 + \sin^2 \theta (d\phi/d\theta)^2} d\theta, \quad \text{or } s = a \int_{\theta_1}^{\theta_2} \sqrt{1 + \sin^2 \theta (\phi')^2} d\theta$$

Now the geodesic on the sphere $r = a$ is the curve for which s is minimum. Here $f = a \sqrt{(1 + \sin^2 \theta \cdot \phi'^2)}$ which is a function of θ and ϕ' while ϕ is absent.

\therefore Euler's equation reduces to $\partial f / \partial \phi' = \text{constant}$.

$$\frac{\partial f}{\partial \phi'} = \frac{a \sin^2 \theta \cdot \phi'}{\sqrt{(1 + \sin^2 \theta \cdot \phi'^2)}} = \text{constant}.$$

or $\frac{\sin^2 \theta \cdot \phi'}{\sqrt{(1 + \sin^2 \theta \cdot \phi'^2)}} = c \text{ (say)} \quad \text{or} \quad \sin^2 \theta (\sin^2 \theta - c^2) \phi'^2 = c^2$

or $\frac{d\phi}{d\theta} = \frac{c}{\sin \theta \sqrt{(\sin^2 \theta - c^2)}} = \frac{c \operatorname{cosec}^2 \theta}{\sqrt{(1 - c^2 \operatorname{cosec}^2 \theta)}}$

Integrating $\phi = \int \frac{c \operatorname{cosec}^2 \theta \cdot d\theta}{\sqrt{[(1 - c^2) - (c \cot \theta)^2]}} + c' = -\sin^{-1} \left\{ \frac{c \cot \theta}{\sqrt{(1 - c^2)}} \right\} + c'$

or $\cot \theta = A \cos \phi + B \sin \phi \quad \text{or} \quad a \cos \theta = Aa \sin \theta \cos \phi + Ba \sin \theta \sin \phi$
or $z = Ax + By$ [By (i) when $r = a$]

This is a plane through the centre $(0, 0, 0)$ of the sphere which cuts the sphere along a great circle. Hence the required geodesics are the arcs of the great circles.

PROBLEMS 35.1

1. Solve the Euler's equation for the following functionals:

(i) $\int_{x_0}^{x_1} (x + y') y' dx \quad$ (ii) $\int_{x_0}^{x_1} (1 + x^2 y') y' dx,$ (V.T.U., 2004)

2. Show that the general solution of the Euler's equation for the integral

$$\int_a^b \frac{1}{y} \sqrt{1 + \left(\frac{dy}{dx} \right)^2} dx \text{ is } (x - h)^2 + y^2 = k^2.$$

Find the extremals of the following functionals:

3. $\int_{x_0}^{x_1} (y^2 + y'^2 + 2ye^x) dx,$ (V.T.U., 2004)

4. $\int_0^{\pi/2} (y^2 + y'^2 - 2y \sin x) dx, y(0) = y(\pi/2) = 0,$ (V.T.U., 2008)

5. $\int_0^{\pi} (y'^2 - y^2 + 4y \cos x) dx; y(0) = 0, y(\pi) = 0,$ (V.T.U., 2008 S)

6. $\int_{x_0}^{x_1} \frac{1+y^2}{y^3} dx, \quad$ 7. $\int_1^2 \frac{x^3}{y^2} dx; y(1) = 0, y(2) = 3.$

8. $\int_1^2 \frac{\sqrt{1+y'^2}}{x} dx; y(1) = 0, y(2) = 1.$ (Madurai, M.E., 2000 S)

9. Solve the variational problem $\delta \int_0^{\pi/2} [y^2 - (y')^2] dx$ under the conditions $y(0) = 0, y(\pi/2) = 2.$ (V.T.U., 2010)

10. A heavy cable hangs freely under gravity between two fixed points. Show that the shape of the cable is a catenary.

11. A particle is moving with a force perpendicular to and proportional to its distance from the line of zero velocity. Show that the path of quickest descent (brachistochrone) is a circle.

12. Find the geodesics on a right circular cone of semi-vertical angle $\alpha.$

35.6 ISOPERIMETRIC PROBLEMS

In certain problems, it is necessary to make a given integral.

$$I = \int_{x_1}^{x_2} f(x, y, y') dx \quad \dots(1)$$

maximum or minimum while keeping another integral

$$J = \int_{x_1}^{x_2} g(x, y, y') dx \quad \dots(2)$$

constant. Such problems involve one or more constraint conditions, just as $J = a$ constant. A typical example of this type is that of finding a closed curve of a given perimeter and maximum area. This being one of the earliest problems to engage attention, we often refer to problems of this type as *isoperimetric problems*.

Such problems are generally solved by the method of Lagrange multipliers. To extremize (1), we multiply

(2) by λ and add to (1) where λ is the Lagrange multiplier. Then the necessary condition for the integral $\int_{x_1}^{x_2} H$

dx to be an extremum is $\frac{\partial H}{\partial y} - \frac{d}{dx} \left(\frac{\partial H}{\partial y'} \right) = 0$ where $H = f + \lambda g$. The values of the two constants of integration and the parameter λ are determined from the three conditions namely : the two boundary conditions and the integral J having given constant value.

Example 35.11. Find the plane curve of fixed perimeter and maximum area.

(V.T.U., 2000 S)

Solution. Let l be the fixed perimeter of a plane curve between the points with abscissae x_1 and x_2 (Fig. 35.5). Then

$$l = \int_{x_1}^{x_2} \sqrt{1+y'^2} dx \quad \dots(i)$$

Also the area between the curve and the x -axis is

$$A = \int_{x_1}^{x_2} y dx \quad \dots(ii)$$

We have to maximize (ii) subject to constraint (i).

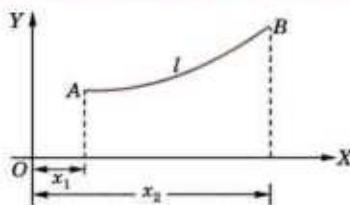

Fig. 35.5

∴ Taking $f = y$ and $g = \sqrt{1+y'^2}$, we write $H = f + \lambda g = y + \lambda \sqrt{1+y'^2}$

Now H must satisfy the Euler's equation

$$\frac{\partial H}{\partial y} - \frac{d}{dx} \left(\frac{\partial H}{\partial y'} \right) = 0 \quad \therefore 1 - \frac{d}{dx} \left[\frac{\lambda y'}{\sqrt{1+y'^2}} \right] = 0$$

Integrating w.r.t. x , we have $x - \lambda y' / \sqrt{1+y'^2} = 0$

Solving for y' , we get $y' = \frac{x-a}{\sqrt{\lambda^2 - (x-a)^2}}$

ebuzzpro.blogspot.com

Integrating again, $y = \sqrt{\lambda^2 - (x-a)^2} + b$ i.e. $(x-a)^2 + (y-b)^2 = \lambda^2$ which is a circle.

Example 35.12. Prove that the sphere is the solid figure of revolution which, for a given surface area, has maximum volume.

(V.T.U., 2006; Madras, 2000 S)

Solution. Consider the arc OPA of the curve which rotates about the x -axis as shown in Fig. 35.6.

$$\text{Then surface area } S = \int_{x=0}^a 2\pi y ds = \int_0^a 2\pi y \sqrt{1+y'^2} dx$$

and volume of the solid so formed $V = \int_0^a \pi y^2 dx$.

Here we have to maximize V subject to fixed S . Taking $f = \pi y^2$ and $g = 2\pi y \sqrt{1 + y'^2}$, we write $H = f + \lambda g = \pi y^2 + 2\pi \lambda y \sqrt{1 + y'^2}$.

Now H has to satisfy Euler's equation. But it does not contain x explicitly.

$$\therefore H - y' \frac{\partial H}{\partial y'} = \text{constant}, c : \text{say}$$

$$\text{i.e., } \pi y^2 + 2\pi \lambda y \sqrt{1 + y'^2} - y' \cdot 2\pi \lambda y \frac{y'}{\sqrt{1 + y'^2}} = c$$

$$\text{or } \pi y^2 + \frac{2\pi \lambda y}{\sqrt{1 + y'^2}} = c \quad \dots(i)$$

Since the curve passes through O and A for which $y = 0$, (i) gives $c = 0$.

$$\therefore y + 2\lambda \sqrt{1 + y'^2} = 0$$

$$\text{Solving for } y', \quad y' \left(= \frac{dy}{dx} \right) = \frac{\sqrt{(4\lambda^2 - y^2)}}{y}$$

Separating the variables and integrating, we get

$$\int dx = \int \frac{y dy}{\sqrt{(4\lambda^2 - y^2)}} + k \quad \text{or} \quad x = k - \sqrt{(4\lambda^2 - y^2)} \quad \dots(ii)$$

When $x = 0, y = 0 \quad \therefore k = 2\lambda$

\therefore (ii) becomes $(x - 2\lambda)^2 + y^2 = (2\lambda)^2$ which is a circle with centre $(2\lambda, 0)$ and radius 2λ .

Hence the figure formed by the revolution of given arc is a sphere.

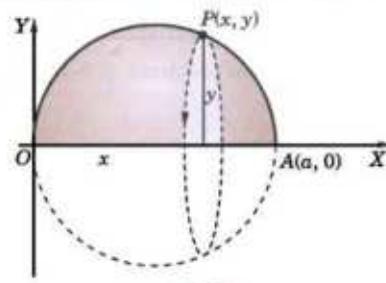

Fig. 35.6

PROBLEMS 35.2

1. Find a function $y(x)$ for which $\int_0^1 (x^2 + y'^2) dx$ is stationary, given that $\int_0^1 y^2 dx = 2; y(0) = 0, y(1) = 0$.

(Madras, 2000 S)

2. Find the extremals of the isoperimetric problem $v[y(x)] = \int_{x_0}^{x_1} y'^2 dx$ given that $\int_{x_0}^{x_1} y dx = c$, a constant.

3. Show that the curve c of given length l which minimizes the curved surface area of the solid generated by the revolution of c about the x -axis is a catenary. (V.T.U., 2000 S)

4. Find the extremal of the functional $I = \int_0^\pi |(y')^2 - y^2| dx$ under the conditions $y(0) = 0, y(\pi) = 1$ and subject to the constraint $\int_0^\pi y dx = 1$.

5. Prove that the extremal of the isoperimetric problem $v[y(x)] = \int_1^4 y'_2 dx, y(1) = 3, y(4) = 24$, subject to the condition $\int_1^4 y dx = 36$ is a parabola. (Madras M.E., 2000)

35.7 SEVERAL DEPENDENT VARIABLES

We now extend the variational problem of § 35.3 to a problem with several variables as functions of a single independent variable i.e., A necessary condition for

$$I = \int_{x_1}^{x_2} f(x, y_1, y_2, \dots, y_n, y'_1, y'_2, \dots, y'_n) dx \quad \dots(1)$$

to be an extremum is that $\frac{\partial f}{\partial y_i} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'_i} \right) = 0, i = 1, 2, \dots, n$... (2)

Let y_1, y_2, \dots, y_n satisfy the boundary conditions $y_i(x_1) = y_{i1}, y_i(x_2) = y_{i2}$

Consider arbitrary functions $\eta_1(x), \eta_2(x), \dots, \eta_n(x)$ which are all zero on the boundary i.e.,

$$\eta_i(x_1) = 0 = \eta_i(x_2)$$

Replacing y_1, y_2, \dots by $y_1 + \varepsilon_1 \eta_1, y_2 + \varepsilon_2 \eta_2, \dots$ in (1), we get

$$I(\varepsilon) = \int_{x_1}^{x_2} f(x, y_1 + \varepsilon_1 \eta_1, y_2 + \varepsilon_2 \eta_2, \dots, y'_1 + \varepsilon_1 \eta'_1, y'_2 + \varepsilon_2 \eta'_2, \dots) dx \quad \dots (3)$$

This is a function of the parameters $\varepsilon_1, \varepsilon_2, \dots$ and reduces to (1) for $\varepsilon_1 = \varepsilon_2 = \dots = 0$.

To find the stationary value of (1), we find the stationary value of $I(\varepsilon)$ for $\varepsilon_1 = \varepsilon_2 = \dots = 0$, $I(\varepsilon)$ will have a stationary value when

$$\frac{\partial I(\varepsilon)}{\partial \varepsilon_1} = 0, \frac{\partial I(\varepsilon)}{\partial \varepsilon_2} = 0, \dots$$

Writing

$$f = f(x, y_1, y_2, \dots, y'_1, y'_2, \dots)$$

and

$$F = f(x, y_1 + \varepsilon_1 \eta_1, y_2 + \varepsilon_2 \eta_2, \dots, y'_1 + \varepsilon_1 \eta'_1, y'_2 + \varepsilon_2 \eta'_2, \dots)$$

$$(3) \text{ becomes } I(\varepsilon) = \int_{x_1}^{x_2} F dx.$$

x_1, x_2 being constants independent of ε_1 , differentiating under the integral sign, we get

$$\frac{\partial I(\varepsilon)}{\partial \varepsilon_1} = \int_{x_1}^{x_2} \frac{\partial F}{\partial \varepsilon_1} dx = \int_{x_1}^{x_2} \left(\frac{\partial F}{\partial y_1} \eta_1 + \frac{\partial F}{\partial y'_1} \eta'_1 \right) dx$$

$$\therefore \frac{\partial I(\varepsilon)}{\partial \varepsilon_1} = 0, \text{ when } \varepsilon_1 = \varepsilon_2 = \dots = 0 \text{ gives}$$

$$\int_{x_1}^{x_2} \left(\frac{\partial f}{\partial y_1} \eta_1 + \frac{\partial f}{\partial y'_1} \eta'_1 \right) = 0$$

Integrating by parts the second term, we get

$$\int_{x_1}^{x_2} \frac{\partial f}{\partial y_1} \eta_1 + \left| \frac{\partial f}{\partial y'_1} \eta_1 \right|_{x_1}^{x_2} - \int_{x_1}^{x_2} \frac{d}{dx} \left(\frac{\partial f}{\partial y'_1} \right) \eta_1(x) dx = 0$$

$$\text{i.e., } \int_{x_1}^{x_2} \left[\frac{\partial f}{\partial y_1} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'_1} \right) \right] \eta_1(x) dx = 0 \quad [\because \eta_1(x_1) = 0 = \eta_1(x_2)]$$

Since this equation must hold good for all values of $\eta_1(x)$, we get

$$\frac{\partial f}{\partial y_1} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'_1} \right) = 0$$

Similarly $\frac{\partial I(\varepsilon)}{\partial \varepsilon_2} = 0$ when $\varepsilon_1 = \varepsilon_2 = \dots = 0$, will give

$$\frac{\partial f}{\partial y_2} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'_2} \right) = 0 \text{ and so on.}$$

All these conditions give a system of Euler's equation (2). A solution of these equations leads to the desired curves.

Example 35.13. Show that the functional $\int_0^{\pi/2} \left[2xy + \left(\frac{dx}{dt} \right)^2 + \left(\frac{dy}{dt} \right)^2 \right] dt$ such that $x(0) = 0, x(\pi/2) = 1, y(0) = 0, y(\pi/2) = 1$ is stationary for $x = -\sin t, y = \sin t$.

Solution. Euler's equations are $\frac{\partial f}{\partial x} - \frac{d}{dt} \left(\frac{\partial f}{\partial x'} \right) = 0$... (i)

$$\frac{\partial f}{\partial y} - \frac{d}{dt} \left(\frac{\partial f}{\partial y'} \right) = 0 \quad \dots (ii)$$

$$\text{Here } f = 2xy + x'^2 + y'^2. \quad \therefore \quad \frac{\partial f}{\partial x} = 2y, \quad \frac{\partial f}{\partial x'} = 2x', \quad \frac{\partial f}{\partial y} = 2x, \quad \frac{\partial f}{\partial y'} = 2y'$$

$$(i) \text{ becomes } 2y - \frac{d}{dt}(2x') = 0 \quad i.e., \quad 2y - 2 \frac{d^2 x}{dt^2} = 0 \quad \text{or} \quad \frac{d^2 x}{dt^2} = y \quad \dots (iii)$$

$$(ii) \text{ becomes } 2x - \frac{d}{dt}(2y') = 0 \quad i.e., \quad 2x - 2 \frac{d^2 y}{dt^2} = 0 \quad \text{or} \quad \frac{d^2 y}{dt^2} = x \quad \dots (iv)$$

Now to solve these simultaneous differential equations, we differentiate (iii) twice,

$$\frac{d^4 x}{dt^4} = \frac{d^2 y}{dt^2} = x \quad [\text{By (iv)}]$$

or $(D^4 - 1)x = 0$ which is a linear equation with constant coefficients.

$$\text{Its solution is } x = c_1 e^x + c_2 e^{-x} + c_3 \cos x + c_4 \sin x \quad \dots (v)$$

$$\text{From (iii), } y = x'' = c_1 e^x + c_2 e^{-x} - c_3 \cos x - c_4 \sin x \quad \dots (vi)$$

$$\text{Since } x = 0 \text{ when } t = 0 \quad \therefore \quad 0 = c_1 + c_2 + c_3 \quad \dots (vii)$$

$$y = 0 \text{ when } t = 0 \quad \therefore \quad 0 = c_1 + c_2 - c_3 \quad \dots (viii)$$

$$\text{Also } x = -1 \text{ when } t = \pi/2 \quad \therefore \quad -1 = c_1 e^{\pi/2} + c_2 e^{-\pi/2} + c_4 \quad \dots (ix)$$

$$y = 1 \text{ when } t = \pi/2 \quad \therefore \quad 1 = c_1 e^{\pi/2} + c_2 e^{-\pi/2} - c_4 \quad \dots (x)$$

$$\text{Adding (vii) and (viii), } c_1 + c_2 = 0$$

$$\text{Adding (ix) and (x), } c_1 e^{\pi/2} + c_2 e^{-\pi/2} = 0$$

Solving these equations, we get $c_1 = c_2 = 0$.

$$\text{From (viii), } c_3 = c_1 + c_2 = 0. \text{ From (ix), } c_4 = -1.$$

Hence from (v), $x = -\sin x$ and from (vi), $y = \sin x$.

35.8 FUNCTIONALS INVOLVING HIGHER ORDER DERIVATIVES

A necessary condition for

$$I = \int_{x_1}^{x_2} f(x, y, y', y'') dx \quad \dots (1)$$

$$\text{to be extremum is } \frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) + \frac{d^2}{dx^2} \left(\frac{\partial f}{\partial y''} \right) = 0.$$

Let $y(x)$ be the function which makes (1) stationary and satisfies the boundary conditions

$$y(x_1) = y_1, y(x_2) = y_2, y'(x_1) = y'_1 \text{ and } y''(x_2) = y''_2.$$

Consider the differentiable function $\eta(x)$ such that

$$\eta(x_1) = 0 = \eta(x_2) \quad \text{and} \quad \eta'(x_1) = 0 = \eta'(x_2) \quad \dots (2)$$

Replacing y by $y + \epsilon \eta$ in (1), we get

$$I(\epsilon) = \int_{x_1}^{x_2} f(x, y + \epsilon \eta, y' + \epsilon \eta', y'' + \epsilon \eta'') dx \quad \dots (3)$$

This is a function of the parameter ϵ and reduces to (1) for $\epsilon = 0$.

To find the stationary value of (1), we find the stationary value of $I(\epsilon)$ for $\epsilon = 0$. But $I(\epsilon)$ will have a stationary value when $dI(\epsilon)/d\epsilon = 0$.

Writing $f = f(x, y, y', y'')$ and $F = f(x, y + \epsilon \eta, y' + \epsilon \eta', y'' + \epsilon \eta'')$.

$$(3) \text{ becomes } I(\epsilon) = \int_{x_1}^{x_2} F dx$$

x_1, x_2 being constants independent of ε , differentiating under the integral sign, we get

$$\frac{dI(\varepsilon)}{d\varepsilon} = \int_{x_1}^{x_2} \frac{dF}{d\varepsilon} dx = \int_{x_1}^{x_2} \left(\frac{\partial F}{\partial y} \eta + \frac{\partial F}{\partial y'} \eta' + \frac{\partial F}{\partial y''} \eta'' \right) dx$$

$$\therefore \frac{dI(\varepsilon)}{d\varepsilon} = 0 \text{ when } \varepsilon = 0 \text{ gives } \int_{x_1}^{x_2} \left(\frac{\partial f}{\partial y} \eta + \frac{\partial f}{\partial y'} \eta' + \frac{\partial f}{\partial y''} \eta'' \right) dx = 0$$

Integrating by parts once the second term and twice the third term, we get

$$\begin{aligned} \int_{x_1}^{x_2} \frac{\partial f}{\partial y} \eta dx + \left| \frac{\partial f}{\partial y'} \eta \right|_{x_1}^{x_2} - \int_{x_1}^{x_2} \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) \cdot \eta dx + \left| \frac{\partial f}{\partial y''} \eta' - \frac{d}{dx} \left(\frac{\partial f}{\partial y''} \right) \cdot \eta \right|_{x_1}^{x_2} \\ + \int_{x_1}^{x_2} \frac{d^2}{dx^2} \left(\frac{\partial f}{\partial y''} \right) \cdot \eta dx = 0 \end{aligned}$$

or

$$\int_{x_1}^{x_2} \left[\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) + \frac{d^2}{dx^2} \left(\frac{\partial f}{\partial y''} \right) \right] \eta(x) dx = 0 \quad [\text{By (2)}]$$

Since this equation must hold good for all values of $\eta(x)$, we get

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) + \frac{d^2}{dx^2} \left(\frac{\partial f}{\partial y''} \right) = 0$$

In general, a necessary condition for the functional $I = \int_{x_1}^{x_2} f(x, y, y', y'', \dots, y^{(n)}) dx$ to be stationary will be

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) + \frac{d^2}{dx^2} \left(\frac{\partial f}{\partial y''} \right) - \dots + (-1)^n \frac{d^n}{dx^n} \left(\frac{\partial f}{\partial y^{(n)}} \right) = 0$$

which is called the *Euler-Poisson equation* and its solutions are called *extremals*.

Example 35.14. Show that the curve which extremizes the functional $I = \int_0^{\pi/4} (y'^2 - y^2 + x^2) dx$ under

the conditions $y(0) = 0, y'(0) = 1, y(\pi/4) = y'(\pi/4) = 11/\sqrt{2}$ is $y = \sin x$.

(Madras M.E., 2000 S)

Solution. The Euler-Poisson equation is

$$\frac{\partial f}{\partial y} - \frac{d}{dx} \left(\frac{\partial f}{\partial y'} \right) + \frac{d^2}{dx^2} \left(\frac{\partial f}{\partial y''} \right) = 0 \quad \dots(i)$$

$$\text{Here } f = (y')^2 - y^2 + x^2, \frac{\partial f}{\partial y} = -2y, \frac{\partial f}{\partial y'} = 0, \frac{\partial f}{\partial y''} = 2y''$$

$$\therefore (i) \text{ becomes } -2y + \frac{d^2}{dx^2}(2y'') = 0 \quad \text{or} \quad y^{(4)} - y = 0 \quad \text{or} \quad (D^4 - 1)y = 0$$

$$\text{Its solution is } y(x) = c_1 e^x + c_2 e^{-x} + c_3 \cos x + c_4 \sin x \quad \dots(ii)$$

$$\therefore y'(x) = c_1 e^x - c_2 e^{-x} - c_3 \sin x + c_4 \cos x \quad \dots(iii)$$

Applying the given boundary conditions to (ii) and (iii), we get

$$0 = y(0) = c_1 + c_2 + c_3, 1 = y'(0) = c_1 - c_2 + c_4$$

$$\frac{1}{\sqrt{2}} = y(\pi/4) = c_1 e^{\pi/4} + c_2 e^{-\pi/4} + \frac{1}{\sqrt{2}} c_3 + \frac{1}{\sqrt{2}} c_4 \quad \dots(iv)$$

$$\frac{1}{\sqrt{2}} = y'(\pi/4) = c_1 e^{\pi/4} - c_2 e^{-\pi/4} - \frac{1}{\sqrt{2}} c_3 + \frac{1}{\sqrt{2}} c_4$$

Solving the equation (iv), we get $c_1 = c_2 = c_3 = 0, c_4 = 1$. Hence the required curve is $y = \sin x$.

PROBLEMS 35.3

1. Show that the functional $\int_0^1 \left[2x + \left(\frac{dx}{dt} \right)^2 + \left(\frac{dy}{dt} \right)^2 \right] dt$, such that $x(0) = 1, y(0) = 1, x(1) = 1.5, y(1) = 1$ is stationary for $x = 1 + t^2/2, y = t$.
2. Find the extremals of the functional $v(y, z) = \int_{z_0}^{z_1} (2yz - 2y^2 + y'^2 - z^2) dx$ (V.T.U., M.E., 2006)
3. Find a function $y(x)$ such that $\int_0^\pi y^2 dx = 1$ which makes $\int_0^\pi y'^2 dx$ a minimum if $y(0) = 0 = y(\pi), y''(0) = 0 = y''(\pi)$.
4. Find the extremals of the functional $\int_0^{\pi/2} (y'^2 - y^2 + x^2) dx$ that satisfies the conditions $y(0) = 1, y'(0) = 0, y(\pi/2) = 0, y'(\pi/2) = -1$. (Madras, M.E., 2000 S)
5. Find the extremals of the functional $\int_{-a}^a (ky + \frac{1}{2}ky'^2) dx$ which satisfies the boundary conditions $y(-a) = 0, y'(-a) = 0, y(a) = 0, y'(a) = 0$.
6. Find the extremals of the following functionals :
- (i) $v[y(x)] = \int_{z_0}^{z_1} (16y^2 - y'^2 + x^2) dx$ (Nagpur, 1997) (ii) $v[y(x)] = \int_{z_0}^{z_1} (2xy + y'^2) dx$,

35.9 APPROXIMATE SOLUTION OF BOUNDARY VALUE PROBLEMS — Rayleigh-Ritz Method

In § 35.3, we have seen that the solution of Euler's differential equation alongwith boundary conditions amounts to extremising a certain definite integral. This fact provides a technique of solving a boundary value problem approximately by assuming a trial solution satisfying the given boundary conditions and then extremising the integral whose integrand is found from the given differential equation.

To solve a boundary value problem of Rayleigh-Ritz method, we try to write the given differential equation as the Euler's equation of some variational problem. Then we reduce this variational problem to a minimising problem assuming an approximate solution in the form

$$\bar{y}(x) = y_0(x) + \sum c_i \phi_i(x) \quad \dots(1)$$

where the *trial functions* $\phi_i(x)$ satisfy the boundary conditions and $\phi_i(x) = 0$ on the boundary C of its region R .

$$\text{Let the integral to be extremised be } I = \int_a^b f(y, y', x) dx \quad \dots(2)$$

such that $y(a) = A$ and $y(b) = B$.

Substituting (1) in (2) by replacing y in \bar{y} in I , giving \bar{I} as a function of the unknowns c_i . Then c 's become parameters which are so determined as to extremise \bar{I} . This requires

$$\frac{\partial \bar{I}}{\partial c_i} = 0, \quad i = 1, 2, \dots$$

Solving these equations, we get the values of c_i , which when substituted in (1) give the desired solution.

Example 35.15. Solve the boundary value problem $y'' - y + x = 0$ ($0 \leq x \leq 1$), $y(0) = y(1) = 0$ by Rayleigh-Ritz method.

Solution. Given differential equation is $y'' - y + x = 0$ $\dots(i)$

Its solution is equivalent to extremising the integral $I = \int_0^1 F(x, y, y') dx$

where

$$F(x, y, y') = 2xy - y^2 - y'^2, \quad \dots(ii)$$

since the Euler's equation $\frac{\partial F}{\partial y} - \frac{d}{dx} \left(\frac{\partial F}{\partial y'} \right) = 0$ gives (i).

Assume that the trial function is $\bar{y}(x) = c_0 + c_1 x + c_2 x^2$... (iii)

To satisfy $y(0) = 0, y(1) = 0$, we require $c_0 = 0, c_2 = -c_1$.

\therefore (iii) becomes $\bar{y}(x) = c_1 x(1-x)$... (iv)

Substituting \bar{y} and \bar{y}' in I , we have

$$\begin{aligned} \bar{I} &= \int_0^1 [2x\bar{y} - \bar{y}^2 - (\bar{y}')^2] dx = \int_0^1 [2c_1(x^2 - x^3) - c_1^2(x - x^2)^2 - c_1^2(1 - x)^2] dx \\ &= \frac{1}{6}c_1 - \frac{11}{30}c_1^2 \end{aligned}$$

Its stationary values are given by $d\bar{I}/dc_1 = 0$. $\therefore \frac{1}{6} - \frac{11}{15}c_1 = 0$ i.e., $c_1 = \frac{5}{22}$.

Thus the approximate solution is $\bar{y}(x) = \frac{5}{22}x(1-x)$... (v)

35.10 WEIGHTED RESIDUAL METHOD—Galerkin's Method

The starting point of this method is to guess a solution to the differential equation which satisfies the boundary conditions. This trial solution will contain certain parameters which can be adjusted to minimize the errors so that the trial solution is as close to the exact solution as possible.

Consider the boundary value problem

$$y'' = f(y, y', x) \text{ with } y(a) = A \text{ and } y(b) = B \quad \dots(1)$$

We write the differential equation as $R = \bar{y}'' - f(\bar{y}, \bar{y}', x)$... (2)

where R is the residual of the equation ($R = 0$ for the exact solution $y(x)$ only which will satisfy the boundary conditions).

Consider the trial solution as $\bar{y}(x) = c_1 \phi_1(x) + c_2 \phi_2(x) + \dots$

where $\bar{y}(a) = A$ and $\bar{y}(b) = B$. The trial solution is differentiated twice and is substituted in (2).

To find c_1, c_2, \dots , we weight the residual by trial functions $\phi_1(x), \phi_2(x), \dots$ and set the integrals to zero. Thus we have $\int_c R \phi_1(x) dx = 0, \int_c R \phi_2(x) dx = 0, \dots$

These lead to simultaneous equations in the unknowns.

Having found c_1, c_2, \dots , the approximate solution $\bar{y}(x)$ is obtained.

Example 35.16. Use Galerkin's method to solve the boundary value problem of Example 35.14.

Compare your approximate solution with the exact solution.

Solution. The residual is $R = \bar{y}'' - \bar{y} + x$... (i)

To find the trial solution which satisfies the boundary conditions, we derive a Lagrangian polynomial (§ 28.8) which passes through the points :

x	:	0	1/2	1
y	:	0	c	0

The resulting polynomial is $\bar{y}(x) = 4cx(1-x)$, so that $\phi(x) = x(1-x)$.

Substituting $\bar{y}(x), \bar{y}'(x)$ in (i), we get $R = 4cx^2 + (1-4c)x - 8c$

Thus $\int R \phi(x) dx = 0$ gives $\int_0^1 [4cx^2 + (1-4c)x - 8c] x(1-x) dx = 0$ whence $c = 5/88$.

Hence the approximate solution is $\bar{y}(x) = \frac{5}{22}x(1-x)$ which is same as found in Example 34.14.

Exact solution. Rewriting the given equation as $(D^2 - 1)y = -x$, we find its solution as $y = c_1 e^x + c_2 e^{-x} + x$

Since $y(0) = 0$ and $y(1) = 0$, therefore $c_2 = -c_1 = 1/(e - e^{-1})$.

Hence the exact solution is $y = x - \frac{e^x - e^{-x}}{e - e^{-1}}$

The approximate and the exact solutions for some values of x are given below for comparison :

x	Approx. Sol.	Exact Sol.
0.25	0.043	0.035
0.50	0.057	0.057
0.75	0.043	0.05

Obs. To obtain a trial solution containing two unknown parameters, we derive a Lagrangian polynomial which passes through the points :

$$\begin{array}{l} x : 0 \quad 1/3 \quad 2/3 \quad 1 \\ y : 0 \quad c_1 \quad c_2 \quad 0 \end{array}$$

More the undetermined parameters, the more accurate is the solution, but it involves more labour to find their values.

Example 35.17. Find the approximate deflection of a simply supported beam under a uniformly distributed load w per unit length, using Galerkin's method.

Solution. The differential equation governing the deflection $y(x)$ of the beam is

$$EI \frac{d^4 y}{dx^4} - w = 0, \quad 0 < x < l \quad (\text{i}) \quad [\S \text{ 14.8}]$$

The boundary conditions to be satisfied are

$$y(x=0) = y(x=l) = 0 \quad (\text{deflection is zero at ends}) \quad \dots (\text{ii})$$

$$\frac{d^2 y}{dx^2}(x=0) = \frac{d^2 y}{dx^2}(x=l) = 0 \quad (\text{bending moment zero at ends})$$

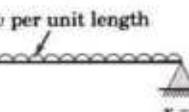

Fig. 35.7

... (iii)

We assume the trial solution $\bar{y}(x) = c_1 \sin(\pi x/l) + c_2 \sin(3\pi x/l)$, which satisfies the boundary conditions (ii) and (iii).

Substituting the trial solution in (i), we obtain the residual

$$R = EI c_1 (\pi l)^4 \sin(\pi x/l) + EI c_2 (3\pi l)^4 \sin(3\pi x/l) - w$$

$$\text{Thus } \int_0^l R \cdot \sin(\pi x/l) dx = 0 \quad \text{and} \quad \int_0^l R \cdot \sin(3\pi x/l) dx = 0$$

Computing these integrals, we get

$$EI c_1 (\pi l)^4 l/2 - w \cdot 2l/\pi = 0, \quad EI c_2 (3\pi l)^4 l/2 - w \cdot 2l/3\pi = 0$$

$$\text{Solving these, we obtain } c_1 = \frac{4wl^4}{\pi^5 EI} \text{ and } c_2 = \frac{4wl^4}{243\pi^5 EI}.$$

Hence the deflection of the beam is given by

$$\bar{y}(x) = \frac{4wl^4}{\pi^5 EI} \left\{ \sin\left(\frac{\pi x}{l}\right) + \frac{1}{243} \sin\left(\frac{3\pi x}{l}\right) \right\}.$$

PROBLEMS 35.4

1. Solve the boundary value problem :

$$y'' + y' + x = 0 \quad (0 \leq x \leq 1), \quad y(0) = y(1) = 0 \text{ by}$$

(i) Rayleigh-Ritz method. (ii) Galerkin's method. Compare your solution with the exact solution.

2. Using Galerkin's method, solve the boundary value problem $y'' = 3x + 4y$; $y(0) = 0$, $y(1) = 1$.

3. Apply Galerkin's method to the boundary value problem $y'' + y' + x = 0$ ($0 \leq x \leq 1$); $y(0) = y(1) = 0$, to find the coefficients of the approximate solution $\bar{y}(x) = c_1 x(1-x) + c_2 x^2(1-x)$.

[Hint. Substituting $\bar{y}(x)$, $\bar{y}'(x)$ in the given equation replacing y, y'' by \bar{y}, \bar{y}'' , we get the residual $R = -2c_1 + c_2(2 - 6x) + x(1-x)(c_1 + c_2x) + x$

$$\text{Thus, } \int_0^1 R \cdot x(1-x) dx = 0 \text{ and } \int_0^1 R \cdot x^2(1-x) dx = 0.$$

Computing these integrals, we get

$$\frac{3}{10}c_1 + \frac{3}{20}c_2 = \frac{1}{12}, \quad \frac{3}{20}c_1 + \frac{13}{305}c_2 = \frac{1}{20}.$$

Solving these, we obtain $c_1 = 71/369$, $c_2 = 7/41$.]

4. Using Ritz method, find an approximate solution of the problem $y'' - y + 4\pi x^2 = 0$, $y'(0) = y(0) = 1$, $y'(1) + y(1) = -e$.
5. Solve the boundary value problem : $y'' + (1+x^2)y + 1 = 0$, $y(-1) = y(1) = 0$, by taking the approximate solution $\bar{y}(x) = c_1(1-x^2) + c_2x^2(1-x^2)$ and using (i) Ritz method, (ii) Galerkin's method.
6. Given the boundary value problem : $y'' + \pi^2y = x$, $y(0) = 1$, $y(1) = -0.9$.

Use Galerkin's method to estimate $y(0.5)$, taking the trial solution :

$$y = 1 - 1.9x + c_1x(1-x) + c_2x^2(1-x).$$

7. Using Galerkin's method, obtain an approximate solution of the boundary value problem :

$$\frac{d}{dx} \left(x \frac{dy}{dx} \right) + y = x, \quad y(0) = 0, \quad y(1) = 1,$$

in the form $\bar{y}(x) = x + x(1-x)(c_1 + c_2x)$.

8. Of all the parabolas which pass through $(0, 0)$ and $(1, 1)$, determine the one, which when rotated about the x -axis, generates a solid of revolution with least possible volume between $x = 0$ and $x = 1$.

[Hint. Take the parabola as $y = x + cx(1-x)$.]

9. Using Rayleigh-Ritz method, find the potential at any point due to a charged sphere of radius a .

[Hint. Potential at a distance r from the centre of the sphere is $\phi = \phi_0(r/a)^k$, where ϕ_0 is the value of ϕ for $r = a$ and $k < 0$ so that $\phi \rightarrow 0$ as $r \rightarrow \infty$.]

Electrostatic field due to charged sphere being conservative, electrostatic intensity $E = \nabla\phi$.

Also potential energy for unit volume = $\frac{1}{8\pi}E^2$

\therefore Total potential energy of the field in the entire region R exterior to the given sphere is

$$\begin{aligned} V &= \frac{1}{8\pi} \iiint_R E^2 dx dy dz = \frac{1}{8\pi} \iiint_R \left[\left(\frac{\partial \phi}{\partial x} \right)^2 + \left(\frac{\partial \phi}{\partial y} \right)^2 + \left(\frac{\partial \phi}{\partial z} \right)^2 \right] dx dy dz \\ &= \frac{1}{8\pi} \int_a^\infty \int_0^\pi \int_0^{2\pi} \left(\frac{\partial \phi}{\partial r} \right)^2 r^2 \sin \theta d\phi dr. \end{aligned}$$

Electrostatic field will be in stable equilibrium if V is minimum, i.e., $dV/dp = 0$ and $d^2V/dp^2 > 0$.

This gives $k = -1$. Hence $\phi = \phi_0/air$.]

35.11 HAMILTON'S PRINCIPLE*

An important concept of mathematical physics is *Hamilton's principle* which states that the time integral of the difference between the kinetic and potential energies of a dynamical system is stationary

Consider a particle of mass m moving from a fixed origin O under the effect of a force F (Fig. 35.8). At any time t , let its position vector be \mathbf{R} . Then by Newton's second law,

$$\frac{md^2\mathbf{R}}{dt^2} = \mathbf{F} \quad \dots(1)$$

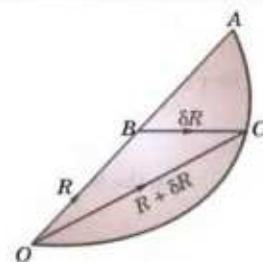

Fig. 35.8

* Named after the Irish mathematician William Rowan Hamilton (1805–1865) who is known for his contributions to dynamics.

Let the natural path OBA of the particle be changed to another path OCA , end points remaining the same. Let this variation in path, often called *virtual displacement*, be $\delta\mathbf{R}$. Then the work done during this displacement is

$$\delta W = \mathbf{F} \cdot \delta\mathbf{R} = \frac{md^2\mathbf{R}}{dt^2} \cdot \delta\mathbf{R} \quad [\text{By (1)}]$$

Also the kinetic energy of the particle is

$$T = \frac{1}{2} m \left(\frac{d\mathbf{R}}{dt} \right)^2$$

$$\therefore \delta T = m \frac{d\mathbf{R}}{dt} \cdot \delta \left(\frac{d\mathbf{R}}{dt} \right) = m \frac{d\mathbf{R}}{dt} \cdot \frac{d}{dt} (\delta\mathbf{R})$$

$$\text{Thus } \delta T + \delta W = m \frac{d\mathbf{R}}{dt} \cdot \frac{d}{dt} (\delta\mathbf{R}) + m \frac{d^2\mathbf{R}}{dt^2} \cdot \delta\mathbf{R} = m \frac{d}{dt} \left(\frac{d\mathbf{R}}{dt} \cdot \delta\mathbf{R} \right)$$

Integrating both sides w.r.t. t from t_0 to t_1 , we get

$$\int (\delta T + \delta W) dt = m \left| \frac{d\mathbf{R}}{dt} \cdot \delta\mathbf{R} \right|_{t_0}^{t_1} = 0 \quad \dots(2) \quad [\because \delta\mathbf{R} = 0 \text{ at } t_0 \text{ and } t_1]$$

If the force field is conservative, there exists a potential V such that $W = -V$. Then (2) takes the form

$$\int (\delta T - \delta V) dt = 0 \quad \text{or} \quad \delta \int (T - V) dt = 0 \quad i.e., \quad \int (T - V) dt \quad \dots(3)$$

is stationary. This proves the Hamilton's principle for a particle. Its derivation can be extended to a system of particles by summation and to a rigid body by integration. Hence the principle is true for any dynamical system.

Obs. It can be easily shown that the integral (3) is a minimum along the natural path as compared to that along any other path joining O to A .

Def. The energy difference $T - V = L$ is called the **kinetic potential** or the **Lagrangian function**.

35.12 LAGRANGE'S EQUATION

In a dynamical system, the position of a body can be specified by the quantities q_1, q_2, \dots, q_n which are called the *generalised coordinates*.

The potential energy V , being a function of position only depends on these generalised coordinates q_i . The kinetic energy T , however, depends upon q_i and the velocities dq/dt (i.e., q_i) $i = 1, 2, \dots, n$. Therefore, Lagrangian function $L = T - V$ is also a function of q_i and q_i , $i = 1, 2, \dots, n$.

Thus by Hamilton's principle, the system moves so that $\int_{t_0}^{t_1} L dt$ is stationary.

$$\therefore \text{Euler's equation must hold good, i.e., } \frac{\partial L}{\partial q_i} - \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{q}_i} \right) = 0, \quad i = 1, 2, \dots, n.$$

These are called *Lagrange's equations* which determine the motion of the system.

Example 35.18. A mass, suspended at the end of a light spring having spring constant k , is set into vertical motion. Use Lagrange's equation, to find the equation of motion of the mass.

Solution. At any time t , let the displacement of m from the equilibrium position O be x (Fig. 35.9). Then the kinetic energy of P is

$$T = \frac{1}{2} m \left(\frac{dx}{dt} \right)^2$$

Also the work done during its fall from O to P is

$$W = \int_0^x (mg - kx) dx = mgx - \frac{1}{2} kx^2.$$

If V is the potential energy of the mass at P , then

$$V = -W = \frac{1}{2} kx^2 - mgx$$

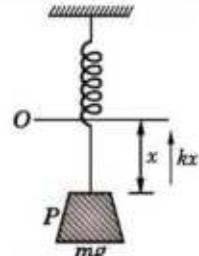

Fig. 35.9

$$\therefore \text{Lagrangian} \quad L = T - V = \frac{1}{2}m\dot{x}^2 + mgx - \frac{1}{2}kx^2.$$

Thus the Lagrange's equation

$$\frac{\partial L}{\partial x} - \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{x}} \right) = 0$$

$$\text{becomes} \quad (mg - kx) - \frac{d}{dt} (m\dot{x}) = 0 \quad \text{or} \quad m \frac{d^2x}{dt^2} = mg - kx$$

which is the required equation of motion.

Example 35.19. Apply Lagrange's equations, to show that the equations of motion of the double pendulum of Fig. 35.10 are given by

$$(m_1 + m_2)l_1 \ddot{\theta}_1 + m_2 l_2 \ddot{\theta}_2 + (m_1 + m_2)g\theta_2 = 0$$

$$\text{and} \quad l_1 \ddot{\theta}_1 + l_2 \ddot{\theta}_2 + g\theta_2 = 0$$

for small angles θ_1, θ_2

(Punjab, M.E., 1997)

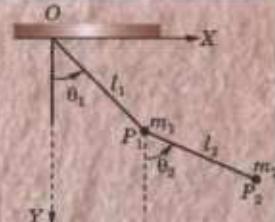

Fig. 35.10

Solution. At any time t , let the masses m_1, m_2 be at $P_1(x_1, y_1)$ and $P_2(x_2, y_2)$ (Fig. 35.10) so that

$$\begin{aligned} x_1 &= l_1 \sin \theta_1, \quad y_1 = l_1 \cos \theta_1 \\ x_2 &= l_1 \sin \theta_1 + l_2 \sin \theta_2, \quad y_2 = l_1 \cos \theta_1 + l_2 \cos \theta_2 \end{aligned} \quad \left. \right\} \quad \dots(i)$$

Then total kinetic energy is

$$\begin{aligned} T &= \frac{1}{2}m_1(\dot{x}_1^2 + \dot{y}_1^2) + \frac{1}{2}m_2(\dot{x}_2^2 + \dot{y}_2^2) \\ &= \frac{1}{2}(m_1 + m_2)l_1^2\dot{\theta}_1^2 + \frac{1}{2}m_2l_2^2\dot{\theta}_2^2 + m_2l_1l_2\dot{\theta}_1\dot{\theta}_2 \cos(\theta_1 - \theta_2) \end{aligned} \quad [\text{Using (i)}]$$

Also total potential energy is

$$V = m_1gl_1(1 - \cos \theta_1) + m_2g(l_1 + l_2 - l_1 \cos \theta_1 - l_2 \cos \theta_2)$$

$$\begin{aligned} \therefore \text{Lagrangian} \quad L &= T - V = \frac{1}{2}(m_1 + m_2)l_1^2\dot{\theta}_1^2 + \frac{1}{2}m_2l_2^2\dot{\theta}_2^2 \\ &\quad + m_2l_1l_2\dot{\theta}_1\dot{\theta}_2 \cos(\theta_1 - \theta_2) - (m_1 + m_2)gl_1(1 - \cos \theta_1) - m_2gl_2(1 - \cos \theta_2) \quad \dots(ii) \end{aligned}$$

Thus the Lagrange's equation corresponding to θ_1 , is

$$\frac{\partial L}{\partial \theta_1} - \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{\theta}_1} \right) = 0, \text{ becomes}$$

$$-m_2l_1l_2\dot{\theta}_1\dot{\theta}_2 \sin(\theta_1 - \theta_2) - (m_1 + m_2)gl_1 \sin \theta_1 - \frac{d}{dt} [(m_1 + m_2)l_1^2\dot{\theta}_1 + m_2l_1l_2\dot{\theta}_2 \cos(\theta_1 - \theta_2)] = 0$$

$$\text{or} \quad (m_1 + m_2)l_1\ddot{\theta}_1 + m_2l_2\ddot{\theta}_2 \cos(\theta_1 - \theta_2) + m_2l_2^2\dot{\theta}_2^2 \sin(\theta_1 - \theta_2) + (m_1 + m_2)g \sin \theta_1 = 0 \quad \dots(iii)$$

Similarly from (ii), Lagrange's equation corresponding to θ_2 , i.e.,

$$\frac{\partial L}{\partial \theta_2} - \frac{d}{dt} \left(\frac{\partial L}{\partial \dot{\theta}_2} \right) = 0$$

$$\text{becomes} \quad m_2l_1l_2\dot{\theta}_1\dot{\theta}_2 \sin(\theta_1 - \theta_2) - m_2gl_2 \sin \theta_2 - \frac{d}{dt} [m_2l_2^2\dot{\theta}_2 + m_2l_1l_2\dot{\theta}_1 \cos(\theta_1 - \theta_2)] = 0$$

$$\text{or} \quad l_2\ddot{\theta}_2 + l_1\dot{\theta}_1 \cos(\theta_1 - \theta_2) - l_1\dot{\theta}_1^2 \sin(\theta_1 - \theta_2) + g \sin \theta_2 = 0 \quad \dots(iv)$$

Now $\dot{\theta}_1$ and $\dot{\theta}_2$ being small, retaining first order terms only, (iii) and (iv) reduce to

$$(m_1 + m_2)l_1\ddot{\theta}_1 + m_2l_2\ddot{\theta}_2 + (m_1 + m_2)g\theta_1 = 0 \quad \text{and} \quad l_1\ddot{\theta}_1 + l_2\ddot{\theta}_2 + g\theta_2 = 0.$$

PROBLEMS 35.5

1. In a single pendulum, a mass m is suspended by a light rod of length l and the system vibrates in a plane. Using Lagrange's equation, show that $\ddot{\theta} + (g/l) \sin \theta = 0$.

Show that if θ is small, the period of oscillation is $2\pi\sqrt{l/g}$.

2. Two masses m_1 and m_2 are connected by an inextensible string which passes over a fixed pulley. Using Lagrange's equations, show that the acceleration of either mass is numerically

$$= (m_1 - m_2) g / (m_1 + m_2).$$

3. A perfectly flexible rope of uniform density per unit length is suspended with its end points fixed. Show that it assumes the shape of a catenary.

4. A bead of mass m from rest slides without friction under gravity along a wire inclined at an angle α to the vertical and rotating with constant angular velocity ω . Show that in times t , the bead has滑 through a distance

$$\frac{g \cos \alpha}{\omega^2 \sin^2 \alpha} \cosh(\omega t \sin \alpha - 1).$$

Integral Equations

Integro-differential equations. 9. Integral equations with separable kernels. 10. Solution of Fredholm equations with separable kernels. 11. Solution of Fredholm and Volterra equations by the method of successive approximations.

36.1 INTRODUCTION

Integral equations play an effective role in the study of boundary value problems. Such equations also occur in many fields of mechanics and mathematical physics. Integral equations may be obtained directly from physical problems e.g., radiation transfer problem and neutron diffusion problem etc. They also arise as representation formulae for the solutions of differential equations. A differential equation can be replaced by an integral equation with the help of initial and boundary conditions.

Integral equations were first encountered in the theory of Fourier integrals. In 1826, another integral equation was obtained by *Abel*. Actual development of the theory of integral equations began with the works of the Italian mathematician V. *Volterra* (1896) and the Swedish mathematician I. *Fredholm* (1900).

36.2 DEFINITION

An integral equation is an equation in which an unknown function appears under the integral sign. We shall take up integral equations in which only linear functions of the unknown function are involved. The general type of linear integral equation is of the form

$$y(x) = F(x) + \lambda \int_a^b K(x, t) y(t) dt$$

where $F(x)$ and $K(x, t)$ are known functions while $y(x)$ is to be determined. The function $K(x, t)$ is called the *Kernel of the integral equation*.

If a and b are constants, the equation is known as *Fredholm integral equation*.

If a is a constant while b is a variable, it is called a *Volterra integral equation*.

36.3 CONVERSION OF A LINEAR DIFFERENTIAL EQUATION TO AN INTEGRAL EQUATION AND VICE VERSA

To make this transformation, the use of the following formula is necessary :

$$\int_a^x \int_a^x f(x) dx dx = \int_a^x (x-t) f(t) dt \quad \dots(I)$$

$$\text{In general, } \int_a^x \int_a^x \dots \int_a^x f(x) dx^n = \frac{1}{(n-1)!} \int_a^x (x-t)^{n-1} f(t) dt \quad \dots(II)$$

Proof. Let $I_n = \int_a^x (x-t)^{n-1} f(t) dt$... (1)

where n is a positive integer and a is a constant.

Differentiating both sides w.r.t. x , using Leibnitz's rule (p. 139)

$$\begin{aligned}\frac{dI_n}{dx} &= \int_a^x \frac{\partial}{\partial x} (x-t)^{n-1} f(t) dt + [(x-t)^{n-1} f(t)]_{t=x} \cdot 1 - [(x-t)^{n-1} f(t)]_{t=a} \cdot 0 \\ &= \int_a^x (n-1)(x-t)^{n-2} f(t) dt = (n-1) I_{n-1}(x)\end{aligned}\quad \dots(2)$$

Again differentiating (2) w.r.t. x

$$\frac{d^2 I_n}{dx^2} = (n-1) \frac{d}{dx} [I_{n-1}(x)] = (n-1)(n-2) I_{n-2}, \text{ using (1)}$$

Proceeding in this way, we get

$$\frac{d^{n-1} I_n}{dx^{n-1}} = (n-1)(n-2) \dots 1 \cdot I_1(x) = (n-1)! I_1(x)$$

Now taking $n = 1$ in (1), we get

$$I_1 = \int_a^x f(t) dt = \int_a^x f(x_1) dx_1 \quad \dots(3)$$

Putting $x = a$ in (1), we obtain

$$I_n(a) = 0 \text{ for all } n$$

Taking $n = 2$ in (2), we get $\frac{dI_2}{dx} = I_1(x)$

$$\begin{aligned}I_2 &= \int_a^x I_1(x_2) dx_2 \quad [\because I_1(a) = 0] \\ &= \int_a^x \int_a^{x_2} f(x_1) dx_1 dx_2 \quad [\text{Using (3)}] \dots(4)\end{aligned}$$

Putting $n = 3$ in (2), we have $\frac{dI_3}{dx} = 2I_2(x)$

$$\begin{aligned}I_3 &= 2 \int_a^x I_2(x) dx \quad [\because I_2(a) = 0] \\ &= 2 \int_a^x \int_a^{x_2} \int_a^{x_3} f(x_1) dx_1 dx_2 dx_3 \quad [\text{Using (4)}]\end{aligned}$$

Proceeding in this way, we get

$$I_n = (n-1)! \int_a^x \int_a^{x_2} \dots \int_a^{x_n} F(x_1) dx_1 dx_2 \dots dx_n$$

i.e., $\int_a^x \int_a^{x_2} \dots \int_a^{x_n} f(x_1) dx_1 dx_2 \dots dx_n = \frac{1}{(n-1)!} \int_a^x (x-t)^{n-1} f(t) dt$

If x_2, x_3, \dots, x_n be the same as x , we get the formula (II) above.

Example 36.1. Convert the differential equation $y''(x) - 3y'(x) + 2y(x) = 5 \sin x$, $y(0) = 1$, $y'(0) = -2$ into an integral equation.

Solution. Integrating both sides of the given differential equation, we get

$$[y'(x) - y'(0)] - 3[y(x) - y(0)] + 2 \int_0^x y(t) dt = 5(1 - \cos x)$$

Since $y'(0) = -2$ and $y(0) = 1$, it becomes

$$y'(x) + 2 - 3y(x) + 3 + 2 \int_0^x y(t) dt = 5 - 5 \cos x$$

i.e.,

$$y'(x) - 3y(x) + 2 \int_0^x y(t) dt = -5 \cos x$$

Integrating again as before, we have

$$[y(x) - y(0)] - 3 \int_0^x y(t) dt + 2 \int_0^x \int_0^t y(t) dt = -5 \sin x$$

or

$$y(x) - 1 - 3 \int_0^x y(t) dt + 2 \int_0^x (x-t) y(t) dt = -5 \sin x \quad [\text{Using (I) above}]$$

or

$$y(x) + \int_0^x [2(x-t) - 3] y(t) dt = 1 - 5 \sin x$$

which is the desired integral equation.

Example 36.2. Show that the integral equation

$$y(x) = \int_0^x (x+t) y(t) dt + 1 \quad \dots(i)$$

is equivalent to the differential equation

$$y''(x) - 2x y'(x) - 3y(x) = 0, y(0) = 1, y'(0) = 0.$$

(Kerala, M. Tech., 2005)

Solution. Differentiating (i) by Leibnitz's rule (p. 139), we have

$$\begin{aligned} \frac{dy}{dx} &= \int_0^x \frac{\partial}{\partial x} (x+t) y(t) dt + (x+x) y(x) \frac{d}{dx} (x) - (x+0) y(0) \frac{d}{dx} (0) \\ &= \int_0^x y(t) dt + 2xy(x) = \int_0^x y(x) dx + 2xy(x) \end{aligned} \quad \dots(ii)$$

Differentiating again w.r.t. x , we get

$$\frac{d^2y}{dx^2} = y(x) + 2[x y'(x) + 1 \cdot y(x)] = 2x y'(x) + 3y(x)$$

$$\text{or} \quad \frac{d^2y}{dx^2} - 2x \frac{dy}{dx} - 3y(x) = 0 \quad \dots(iii)$$

Putting $x = 0$ in (i), we obtain

$$y(0) = \int_0^0 (x+t) y(t) dt + 1 \quad \text{i.e., } y(0) = 1$$

and putting $x = 0$ in (ii), we get $y'(0) = 0$.Hence (i) is equivalent to (iii) with initial conditions $y(0) = 1, y'(0) = 0$.**Example 36.3.** Show that the integral equation

$$y(x) = \int_0^x t(t-x) y(t) dt + \frac{1}{2} x^2, \quad \dots(iv)$$

is equivalent to the differential equation

$$\frac{d^2y}{dx^2} + xy = 1 \text{ and the conditions } y(0) = y'(0) = 0.$$

Solution. Differentiating (iv) w.r.t. x by Leibnitz's rule (p. 139), we have

$$\begin{aligned} \frac{dy}{dx} &= \int_0^x \frac{\partial}{\partial x} [t(t-x)] y(t) dt + [t(t-x)y(t)]_{t=x} \cdot 1 + x - [t(t-x)y(t)]_{t=0} \cdot 0 \\ &= \int_0^x t(-1) y(t) dt + x = x - \int_0^x ty(t) dt \end{aligned} \quad \dots(v)$$

Differentiating (v) w.r.t. x , we get

$$\frac{d^2y}{dx^2} = 1 - \left\{ \int_0^x \frac{\partial}{\partial x} [t y(t)] dt - [t y(t)]_{t=0} \cdot 0 + [ty(t)]_{t=x} \cdot 1 \right\} = 1 - xy(x)$$

or $\frac{d^2y}{dx^2} + xy = 1$ which is the differential equation corresponding to (i).

Also $y(0) = 0$ and $y'(0) = 0$.

Example 36.4. Find the integral equation corresponding to the boundary value problem
 $y''(x) + \lambda y(x) = 0, \quad y(0) = y(1) = 0.$

Solution. Integrating both sides of the given differential equation w.r.t. x over $(0, x)$, we get

$$y'(x) - y'(0) + \lambda \int_0^x y(x) dx = 0$$

or $y'(x) = c - \lambda \int_0^x y(x) dx$, taking $y'(0) = c$... (i)

Again integrating (i) w.r.t. x in $(0, x)$, we obtain

$$y(x) - y(0) = cx - \lambda \int_0^x \int_0^x y(x) dx$$

$$y(x) = cx - \lambda \int_0^x (x-t) y(t) dt$$
 ... (ii)

[Using (I) of § 36.3 and noting that $y(0) = 0$]

Putting $x = 1$ in (ii), we get

$$y(1) = c - \lambda \int_0^1 (1-t) y(t) dt \quad [\because y(1) = 0]$$

$$\therefore c = \lambda \int_0^1 (1-t) y(t) dt \quad \dots (iii)$$

Substituting the value of c from (iii) in (ii), we get

$$\begin{aligned} y(x) &= \lambda x \int_0^1 (1-t) y(t) dt - \lambda \int_0^x (x-t) y(t) dt \\ &= \lambda x \left\{ \int_0^x (1-t) y(t) dt + \int_x^1 (1-t) y(t) dt \right\} - \lambda \int_0^x (x-t) y(t) dt \\ &= \lambda \int_0^x t(1-x) y(t) dt + \lambda \int_x^1 (1-t) y(t) dt \\ &= \lambda \left\{ \int_0^x K(x, t) y(t) dt + \int_x^1 K(x, t) y(t) dt \right\} \end{aligned}$$

where

$$K(x, t) = \begin{cases} t(1-x) & \text{when } t < x \\ x(1-t) & \text{when } t > x \end{cases}$$

Hence $y(x) = \lambda \int_0^1 K(x, t) y(t) dt$

which is a *Fredholm integral equation* with a symmetric kernel $K(x, t)$.

PROBLEMS 36.1

Transform each of the following boundary value problems into corresponding integral equations :

1. $y'' + xy' + y = 0$, given that $y(0) = 1, y'(0) = 0$.

(Mudras, M.E., 2000)

2. $y'' - \sin xy' + e^x = x$, given that $y = 1, \frac{dy}{dx} = -1$ when $x = 0$.

3. $y'' + xy' = 1$, given that $y(0) = y'(0) = 0$.

(Madras, 2000 S)

4. $y'' + (1-x)y' + e^{-x}y = x^3 - 5x$, given that $y = -3, \frac{dy}{dx} = 4$ when $x = 0$.

5. $\frac{d^3y}{dx^3} + y = \cos x$ given that $y = 0, y' = 1, y'' = 2$ at $x = 0$.

(Kerala, M.Tech, 2005)

6. $\frac{d^3y}{dx^3} + \frac{d^2y}{dx^2} - xy = \sin x$ given that $y = 1, y' = -1, y'' = \frac{1}{2}$ at $x = 0$.

7. $\frac{d^4y}{dx^4} - 4\frac{d^3y}{dx^3} + 6\frac{d^2y}{dx^2} - 4\frac{dy}{dx} + y = 4 \cos 2x$ given that
 $y = -1, y' = 4, y'' = 0, y''' = 2$ when $x = 0$.

Convert each of the following integral equations into differential equations alongwith initial conditions:

8. $y(x) = \int_0^x (x-t) y(t) dt - 1.$

9. $y(x) = \int_0^x (x-t) y(t) dt + 3 \sin x.$

10. $y(x) + 3 \int_0^x (x-t)^2 y(t) dt = x^2 - 3x + 4.$

11. $y(x) + \int_0^x (x-t)^2 + 4(x-t) - 3y(t) dt = e^{-x}.$

12. If $y''(x) = f(x); y(0) = y(l) = 0$, show that $y(x) = \int_0^l K(x,t) f(t) dt$,

where $K(x,t) = \begin{cases} \frac{t}{l}(x-l) & \text{when } t < x \\ \frac{x}{l}(t-l) & \text{when } t > x \end{cases}$

36.4 CONVERSION OF BOUNDARY VALUE PROBLEMS TO INTEGRAL EQUATIONS USING GREEN'S FUNCTION

Consider the linear homogeneous differential equation

$$L(y) + \phi(x) = 0 \quad \dots(1)$$

where $L(y) = \left[\frac{d}{dx} \left(p \frac{dy}{dx} \right) + q \right] y = py'' + p'y' + qy \quad \dots(2)$

together with the homogeneous boundary conditions of the form

$$\alpha y + \beta \frac{dy}{dx} = 0 \quad \dots(3)$$

Now let us find a function $G(x, t)$ which for a given number t , is given by $G_1(x)$ when $x < t$ and by $G_2(x)$ when $x > t$ and which has the following properties :

I. G_1 and G_2 satisfy the equation $L(G) = 0$ in their defined intervals i.e., $L(G_1) = 0$ when $x < t$; $L(G_2) = 0$ when $x > t$.

II. G_1 and G_2 satisfy the boundary conditions at the end points $x = a$ and $x = b$ respectively.

III. $G(x, t)$ is continuous at $x = t$ i.e., $G_1(t) = G_2(t)$.

IV. The derivative of G is continuous at every point within the range of x except at $x = t$ i.e., $G_2'(t) - G_1'(t) = -1/p(t)$

Def. $G(x, t)$ as defined above is called the **Green's function**.

If $G(x, t)$ exists, then the solution of the given problem can be transformed to the integral equation

$$y(x) = \int_a^b G(x, t) \phi(t) dt \quad \dots(4)$$

Let $y = y_1(x)$ and $y = y_2(x)$ be the non-trivial solutions of the equations $L(y) = 0$ which satisfy the homogeneous conditions at $x = a$ and $x = b$ respectively.

The above conditions I and II are satisfied if we write

$$G = \begin{cases} C_1 y_1(x), & \text{when } x < t \\ C_2 y_2(x), & \text{when } x > t \end{cases} \quad \dots(5)$$

Imposing the condition III on (5), we get

$$C_2 y_2(t) - C_1 y_1(t) = 0 \quad \dots(6)$$

Imposing the condition IV on (5), we have

$$C_2 y_2'(t) - C_1 y_1'(t) = -1/p(t) \quad \dots(7)$$

Equations (6) and (7) give a unique solution, if

$$\begin{vmatrix} y_1(t) & y_2(t) \\ y_1'(t) & y_2'(t) \end{vmatrix} = y_1(t)y_2'(t) - y_2(t)y_1'(t) \neq 0$$

By Abel's formula*, we find that

$$y_1(t)y_2'(t) - y_2(t)y_1'(t) = C/p(t) \quad \dots(8)$$

Now [(7) $\times y_2(t)$ - (6) $\times y_1(t)$] gives on using (8),

$$C_1 = -\frac{1}{C} y_2(t) \text{ and } C_2 = -\frac{1}{C} y_1(t)$$

$$\text{Thus (5) reduces to } G(x, t) = \begin{cases} -\frac{1}{C} y_1(x) y_2(t), & x < t \\ -\frac{1}{C} y_1(t) y_2(x), & x > t \end{cases} \quad \dots(9)$$

Conversely it can be shown that the integral equation.

$$y(x) = \int_a^b G(x, t) \phi(t) dt$$

where $G(x, t)$ is as defined by (9), satisfies the differential equation $L(y) + \phi(x) = 0$ together with the prescribed boundary conditions.

Example 36.5. Transform the differential equation $y'' + y = x$, $y(0) = 1$, $y'(1) = 0$ to a Fredholm integral equation, finding the corresponding Green's function. (Madras M.E., 2000 S)

Solution. Given equation is $L(y) + \phi(x) = 0$...(i)

with the conditions $y(0) = 0$, $y'(1) = 0$, where $L(y) = y''$ and $\phi(x) = y - x$

The associated equation $L(y) = 0$ is $y''(y) = 0$...(ii)

Its solution is $y = C_1 x + C_2$...(iii)

Now $y_1(x)$ is a particular solution of (ii) satisfying the condition $y(0) = 0$.

\therefore Taking $C_2 = 0$ and $C_1 = 1$, we get $y_1(x) = x$...(iv)

$y_2(x)$ is another solution of (ii) satisfying the condition $y'(1) = 0$.

\therefore From (iii), $y'(1) = C_1 = 0$. Then $y(x) = C_2$

Taking $C_2 = 1$, a particular solution is $y_2(x) = 1$.

The constant C is found from $y_1(x)y_2'(x) - y_2(x)y_1'(x) = \frac{C}{p(x)}$

Since $L(y) = py'' + p'y' + qy = y''$ (given), $\therefore p = 1$.

Thus $C = y_1(x)y_2'(x) - y_2(x)y_1'(x) = x \cdot 0 - 1 \cdot 1 = -1$.

\therefore Green's function is given by

$$G(x, t) = \begin{cases} -\frac{y_1(x)y_2(t)}{C}, & x < t \\ -\frac{y_1(t)y_2(x)}{C}, & x > t \end{cases} = \begin{cases} x, & x < t \\ t, & x > t \end{cases} \quad \dots(v)$$

Hence the equation (i) is equivalent to the integral equation

$$\begin{aligned} y(x) &= \int_0^1 G(x, t) \phi(t) dt = \int_0^1 G(x, t) \cdot (y - t) dt \\ &= \int_0^1 G(x, t) y(t) dt - \left[\int_0^x t \cdot dt + \int_x^1 t \cdot dt \right] \end{aligned}$$

* The conditions that $y_1(x)$ and $y_2(x)$ satisfy the equation

$L(y) = 0$ are $(py_1)' + qy_1 = 0$...(i), $(py_2)' + qy_2 = 0$...(ii)

[(i) $\times y_2$ - (ii) $\times y_1$] gives $y_2(py_1)' - y_1(py_2)' = 0$

or $[p(y_1y_2' - y_2y_1')]' = 0$ or $y_1y_2' - y_2y_1' = C/p$

$$\begin{aligned}
 &= \int_0^1 G(x, t) y(t) dt - \left[x \left| \frac{t^2}{2} \right|_0^x + \left| \frac{t^3}{3} \right|_x^1 \right] \\
 &= \int_0^1 G(x, t) y(t) dt - \frac{1}{6} (x^3 + 2)
 \end{aligned}$$

where $G(x, t)$ is given by (v).

Example 36.6. Find the Green's function for the boundary value problem

$$d^2y/dx^2 + \mu^2 x = 0, \quad y(0) = 0 = y(1).$$

Solution. We observe that the solution $y_1 = \sin \mu x$ satisfies the boundary condition $y(0) = 0$ and the solution $y_2 = \sin \mu(x - 1)$ satisfies the second condition $y(1) = 0$. Also both these solutions are linearly independent.

The constant C is found from $y_1 y_2' - y_2 y_1' = C/p(x)$.

Since $L(y) = py'' + p'y' + qy = y''$ (given), $\therefore p = 1$

$$\therefore C = y_1 y_2' - y_2 y_1' = \mu \sin \mu x \cos \mu(x - 1) - \mu \sin \mu(x - 1) \cos \mu x = \mu \sin \mu$$

Hence the Green's function is given by

$$G(x, t) = \begin{cases} -\frac{y_1(x) y_2(t)}{C}, & x < t \\ -\frac{y_1(t) y_2(x)}{C}, & x > t \end{cases} = \begin{cases} -\frac{\sin \mu x \sin \mu(t-1)}{\mu \sin \mu}, & x < t \\ -\frac{\sin \mu t \sin \mu(x-1)}{\mu \sin \mu}, & x > t \end{cases}$$

PROBLEMS 36.2

- Transform the problem $d^2y/dx^2 + xy = 1 ; y(0) = 0 = y(1)$ to an integral equation, finding the corresponding Green's function.
- Transform the problem $y'' + y = x ; y(0) = 1, y'(1) = 0$ to an integral equation using Green's function.
- Construct an integral equation corresponding to the boundary value problem

$$\frac{d^2u}{dx^2} + e^x u = x ; u(0) = 0, u(1) = 1.$$

- Find the Green's function for the boundary value problem $d^2y/dx^2 - y = 0$ with $y(0) = y(1) = 0$.

- Transform the boundary value problem $x^2 \frac{d^2u}{dx^2} + x \frac{du}{dx} + (\lambda x^2 - 1) u = 0 ; u(0) = u(1) = 0$, to an integral equation.

[Hint. $u_1(x) = x, u_2(x) = \frac{1}{x} - x$ and $C = -2$]

36.5 SOLUTION OF AN INTEGRAL EQUATION

The solution of the integral equation $y(x) = F(x) + \lambda \int_a^b K(x, t) y(t) dt$ is a function $y(x)$ which when substituted in the equation reduces it to an identity w.r.t. x .

Example 36.7. Show that $y(x) = 2 - x$ is a solution of the integral equation

$$\int_0^x e^{x-t} y(t) dt = e^x + x - 1. \quad \dots (i)$$

Solution. Since

$$y(t) = 2 - t$$

$$\therefore \int_0^x e^{x-t} y(t) dt = \int_0^x e^{x-t} (2-t) dt$$

$$= 2e^x \int_0^x e^{-t} dt - e^x \int_0^x t e^{-t} dt$$

$$\begin{aligned}
 &= 2e^x - e^{-t} \Big|_0^x - e^x \left\{ \left[t \cdot (-e^{-t}) \right]_0^x - \int_0^x 1 \cdot (-e^{-t}) dt \right\} \\
 &= 2e^x (-e^{-x} + 1) + e^x (xe^{-x}) - e^x \Big|_0^x - e^{-t} \Big|_0^x \\
 &= -2 + 2e^x + x + e^x (e^{-x} - 1) = e^x + x - 1.
 \end{aligned}$$

Thus (i) is identically satisfied by $y(x) = 2 - x$. Hence $y(x) = 2 - x$ is a solution of (i).

Example 36.8. Show that the function $y(x) = (1 + x^2)^{-3/2}$ is a solution of the Volterra integral equation :

$$y(x) = \frac{1}{1+x^2} - \int_0^x \frac{t}{1+x^2} y(t) dt. \quad \dots(i)$$

Solution. Substituting $y(x) = (1 + x^2)^{-3/2}$ in the R.H.S. of (i), we have

$$\begin{aligned}
 &\frac{1}{1+x^2} - \int_0^x \frac{t}{1+x^2} \cdot \frac{1}{(1+t^2)^{3/2}} dt \\
 &= \frac{1}{1+x^2} + \frac{1}{1+x^2} \left\{ \frac{1}{(1+t^2)^{1/2}} \right\}_0^x \\
 &= \frac{1}{1+x^2} + \frac{1}{1+x^2} \cdot \frac{1}{(1+x^2)^{1/2}} - \frac{1}{1+x^2} = \frac{1}{(1+x^2)^{3/2}} = y(x)
 \end{aligned}$$

Thus $y(x) = (1 + x^2)^{-3/2}$ is a solution of the integral equation (i).

Example 36.9. Show that the function $y(x) = xe^x$ is a solution of the integral equation

$$y(x) = \sin x + 2 \int_0^x \cos(x-t) y(t) dt. \quad \dots(ii)$$

Solution. Substituting $y(x) = xe^x$ in the R.H.S. of (i), we have

$$\begin{aligned}
 &\sin x + 2 \int_0^x \cos(x-t) \cdot te^t dt \\
 &= \sin x + 2 \left\{ \cos x \int_0^x t \cdot e^t \cos t dt + \sin x \int_0^x te^t \sin t dt \right\} \quad (\text{Integrating by parts}) \\
 &= \sin x + 2 \cos x \left\{ \frac{1}{2} \left[t \cdot e^t (\cos t + \sin t) \right]_0^x - \frac{1}{2} \int_0^x e^t (\cos t + \sin t) dt \right\} \\
 &\quad + 2 \sin x \left\{ \frac{1}{2} \left[t \cdot e^t (\sin t - \cos t) \right]_0^x - \frac{1}{2} \int_0^x e^t (\sin t - \cos t) dt \right\} \\
 &= \sin x + xe^x (\cos^2 x + \cos x \sin x + \sin^2 x - \sin x \cos x) \\
 &\quad - \cos x \int_0^x e^t (\cos t + \sin t) dt - \sin x \int_0^x t (\sin t - \cos t) dt \\
 &= \sin x + xe^x - \cos x \Big| e^t \sin t \Big|_0^x + \sin x \Big| e^t \cos t \Big|_0^x \\
 &= \sin x + xe^x - e^x \cos x \sin x + e^x \sin x \cos x - \sin x = xe^x
 \end{aligned}$$

Thus $y(x) = xe^x$ is a solution of the integral equation (i).

36.6 INTEGRAL EQUATIONS OF THE CONVOLUTION TYPE

$$y(x) = F(x) + \int_0^x K(x-t) y(t) dt$$

is an *integral equation of convolution type* and can be written as

$$y(x) = F(x) + K(x) * y(x)$$

[See p. 748]

It is a special integral equation of importance in applications.

Taking Laplace transform of both sides, assuming that $L[F(x)] = f(s)$ and $L[K(x)] = k(s)$ both exist, and using convolution theorem

$$\bar{y}(s) = f(s) + k(s) \cdot y(s) \quad \text{or} \quad \bar{y}(s) = \frac{f(s)}{1 - k(s)}$$

Now taking the inverse transform of both sides, we get the required solution.

Example 36.10. Solve the integral equation

$$y(x) = 3x^2 + \int_0^x y(t) \sin(x-t) dt.$$

Solution. Given integral equation can be written as

$$y(x) = 3x^2 + y(x) * \sin(x-t) \quad \dots(i)$$

Taking Laplace transform of both sides and using the convolution theorem (p. 748), we get

$$\bar{y} = \frac{6}{s^3} + y \cdot \frac{s}{s^2 + 1} \quad \text{or} \quad \bar{y} = \frac{6(s^2 + 1)}{s^5} = 6 \left(\frac{1}{s^3} + \frac{1}{s^5} \right)$$

$$\text{On inversion, we get} \quad y = 6 \left(\frac{x^2}{2!} + \frac{x^4}{4!} \right) = 3x^2 + x^4/4$$

which is the required solution of (i).

Obs. The above solution can also be verified by direct substitution in the given integral equation.

Example 36.11. Solve $y(x) = x + 2 \int_0^x \cos(x-t) y(t) dt.$

Solution. The given equation can be written as

$$y(x) = x + 2 \cos(x) * y(x)$$

Taking Laplace transform of both sides and using convolution theorem, we get

$$\bar{y}(s) = \frac{1}{s^2} + 2 \frac{s}{s^2 + 1} \cdot \bar{y}(s) \quad \text{or} \quad \bar{y} \left(1 - \frac{2s}{s^2 + 1} \right) = \frac{1}{s^2}$$

$$\text{or} \quad \bar{y} = \frac{s^2 + 1}{s^2(s-1)^2} = \frac{2}{s} + \frac{1}{s^2} - \frac{2}{s-1} + \frac{2}{(s-1)^2}$$

$$\text{On inversion, we obtain} \quad y = 2 + x - 2e^x + 2xe^x$$

Hence $y = x + 2 + 2(x-1)e^x$ is the desired solution.

Example 36.12. Solve the integral equation $\int_0^x y(t) y(x-t) dt = 4 \sin 9x.$

Solution. The given integral equation can be written as

$$y(x) * y(x) = 4 \sin 9x \quad \dots(i)$$

Taking Laplace transform of both sides and using the convolution theorem, we get

$$(\bar{y}(s))^2 = \frac{36}{s^2 + 81} \quad \text{or} \quad \bar{y} = \pm \frac{6}{\sqrt{s^2 + 81}}$$

On inversion and noting that $L^{-1} \frac{1}{\sqrt{(s^2 + a^2)}} = J_0(ax)$, we get

$$y = \pm 6 L^{-1} \left\{ \frac{1}{\sqrt{(s^2 + 9^2)}} \right\} = \pm 6 J_0(9x)$$

Thus $y = 6J_0(9x)$ and $y = -6J_0(9x)$ are both solutions of (i).

36.7 ABEL'S INTEGRAL EQUATION

The integral equation $\int_0^x \frac{y(t)}{(x-t)^\alpha} dx = G(x)$

such that $G(x)$ is given and α is a constant ($0 < \alpha < 1$), is known as *Abel's integral equation*. This is an important integral equation of the convolution type. An application of this equation is in finding the shape of a smooth wire lying in a vertical plane such that a bead placed anywhere on the wire slides to the lowest point in the same time. This is the well known *tautochrone problem* and the shape of the wire is a *cycloid*.

Example 36.13. Solve the Abel's integral equation $\int_0^x \frac{y(t)}{\sqrt{x-t}} dt = 1 + 2x - x^2$.

Solution. The given equation can be written as

$$y(x) * x^{-1/2} = 1 + 2x - x^2$$

Taking the Laplace transform of both sides and using convolution theorem, we get

$$\bar{y} \cdot L(x^{-1/2}) = L(1 + 2x - x^2)$$

or

$$\bar{y} \frac{\Gamma(1/2)}{s^{1/2}} = \frac{1}{s} + \frac{2}{s^2} - \frac{2}{s^3} \quad \text{or} \quad \bar{y} = \frac{1}{\Gamma(1/2)} \left(\frac{1}{s^{1/2}} + 2 \cdot \frac{1}{s^{3/2}} - 2 \cdot \frac{1}{s^{5/2}} \right)$$

On inversion, and noting that $L^{-1} \frac{1}{s^n+1} = \frac{x^n}{\Gamma(n+1)}$, we have

$$\begin{aligned} y &= \frac{1}{\Gamma(\frac{1}{2})} \frac{x^{-1/2}}{\Gamma(\frac{1}{2})} + 2 \cdot \frac{x^{1/2}}{\Gamma(\frac{3}{2})} - 2 \cdot \frac{x^{3/2}}{\Gamma(\frac{5}{2})} \\ &= \frac{1}{\pi} \left(x^{-1/2} + 4x^{1/2} - \frac{8}{3}x^{3/2} \right) \end{aligned}$$

Hence

$$y = \frac{1}{3\pi\sqrt{x}} (3 + 12x - 8x^3) \text{ is the desired solution.}$$

36.8 INTEGRO-DIFFERENTIAL EQUATIONS

An integral equation in which various derivatives of the unknown function $y(x)$ are also present, is called an *integro-differential equation*. An example of such an equation is

$$y'(x) = y(x) - \cos x + \int_0^x \sin(x-t) y(t) dt$$

The solution of integro-differential equation subject to given initial conditions can also be found by Laplace transforms as illustrated below :

Example 36.14. Solve $\frac{dy}{dx} + 3y + 2 \int_0^x y dx = x$, given $y(0) = 1$.

Solution. Given equation can be written as $y'(x) + 3y(x) + 2 \int_0^x y dx = x$

Taking Laplace transform of both sides, we get

$$L[y'(x)] + 3L[y(x)] + 2L \left[\int_0^x y(x) dx \right] = L(x)$$

or

$$[s \bar{y}(s) - y(0)] + 3 \bar{y}(s) + 2 \frac{1}{s} \bar{y}(s) = \frac{1}{s^2} \quad [\text{Using } \S 21.6]$$

$$s\bar{y} + 3\bar{y} + 2 \frac{1}{s}\bar{y} = 1 + \frac{1}{s^2} \quad [\because y(0) = 1]$$

or

$$\bar{y} = \frac{1+s^2}{s(s^2+3s+2)} = \frac{1+s^2}{s(s+1)(s+2)} = \frac{1}{2s} - \frac{2}{s+1} + \frac{5}{2(s+2)}$$

On inversion, we obtain $y = \frac{1}{2} L^{-1}\left(\frac{1}{s}\right) - 2L^{-1}\left(\frac{1}{s+1}\right) + \frac{5}{2} L^{-1}\left(\frac{1}{s+2}\right)$

Hence $y = \frac{1}{2} - 2e^{-x} + \frac{5}{2} e^{-2x}$ is the required solution.

Example 36.15. Solve $\frac{dy}{dx} = 3 \int_0^x \cos 2(x-t) y(t) dt + 2$ given $y(0) = 1$.

Solution. Given equation can be written as

$$y'(x) = 3 \cos 2x * y(x) + 2$$

Taking Laplace transform of both sides, we get

$$\begin{aligned} L[y'(x)] &= 3L(\cos 2x) \cdot \bar{y}(s) + \frac{2}{s} \\ s\bar{y}(s) - y(0) &= \frac{3s\bar{y}(s)}{s^2+4} + \frac{2}{s} \quad \text{or} \quad \bar{y} = \frac{(s+2)(s^4+4)}{s^2(s^2+1)} \\ &= \frac{4}{s} + \frac{8}{s^2} - 3\frac{s}{s^2+1} - 6\frac{1}{s^2+1} \end{aligned} \quad [\because y(0) = 1]$$

On inversion, we obtain $y = 4 + 8x - 3 \cos x - 6 \sin x$

which is the required solution.

Obs. The given integro-differential equation can be converted into the following integral equation by integrating it from 0 to x and using $y(0) = 1$.

$$y(x) = 2x + 1 + 3 \int_0^x (x-t) \cos 2(x-t) y(t) dt.$$

PROBLEMS 36.3

1. Show that $y(x) = 1-x$ is a solution of the integral equation $\int_0^x e^{x-t} y(t) dt = x$.

2. Show that $y(x) = 1$ is a solution of the Fredholm integral equation

$$y(x) + \int_0^1 x(e^{tx}-1) y(t) dt = e^x - x.$$

3. Show that $y(x) = \frac{1}{\pi\sqrt{x}}$ is a solution of the integral equation $\int_0^x \frac{y(t)}{\sqrt{(x-t)}} dt = 1$.

4. Show that $y(x) = e^x(2x-2/3)$ is a solution of the Fredholm integral equation

$$y(x) + \int_0^1 e^{x-t} y(t) dt = 2xe^x.$$

Solve each of the following integral equations :

5. $y(x) = x + \frac{1}{6} \int_0^x (x-t)^2 y(t) dt.$

6. $y(x) = x^2 + \int_0^x y(t) \sin(x-t) dt.$

7. $\int_0^x y(t) y(x-t) dt = 2y(x) + x - 2.$

8. $\int_0^x y(t) y(x-t) dt = 9 \sin 4x.$

9. Find a solution of the integral equation $y(x) = \frac{1}{2} \sin 2x + \int_0^x y(t) y(x-t) dt.$

Solve the following integral equations :

10. $\frac{dy}{dx} + 4y + 5 \int_0^x y(t) dt = e^{-x}, y(0) = 0.$

11. $\frac{dy}{dx} + 2y + \int_0^x y(t) dt = \sin x, y(0) = 1. \quad (\text{Mumbai, 2006})$

12. $y'(x) = x + \int_0^x y(x-t) \cos t dt, y(0) = 1.$

13. $y'(x) = \int_0^x y(t) \cos(x-t) dt, y(0) = 1.$

14. $\int_0^x \frac{y(t)}{\sqrt{x-t}} dt = \sqrt{x}.$

15. $\int_0^x \frac{y(t)}{(x-t)^{1/2}} dt = x(x+1).$

36.9 INTEGRAL EQUATIONS WITH SEPARABLE KERNELS

A kernel $K(x, t)$ of Fredholm integral equation is said to be *separable* (or *degenerate*) if it can be expressed as the sum of a finite number of terms, each of which is the product of a function of x alone and a function of t alone i.e., if it is of the form $K(x, t) = \sum_{n=1}^m f_n(x) g_n(t)$.

Also since $\cos(x+t) = \cos x \cos t - \sin x \sin t$, $\cos(x+t)$ is a separable kernel.

36.10 SOLUTION OF FREDHOLM EQUATIONS WITH SEPARABLE KERNELS

Consider the integral equation

$$y(x) = \lambda \int_a^b K(x, t) \cdot y(t) dt + F(x) \quad \dots(1)$$

where

$$K(x, t) = f_1(x) \cdot g_1(t) + f_2(x) \cdot g_2(t) + \dots + f_m(x) \cdot g_m(t) \quad \dots(2)$$

Substituting (2) in (1), we get

$$\begin{aligned} y(x) &= \lambda \int_a^b \left[\sum_{n=1}^m f_n(x) \cdot g_n(t) \right] y(t) dt + F(x) \\ &= \lambda \sum_{n=1}^m f_n(x) \left\{ \int_a^b g_n(t) y(t) dt \right\} + F(x) \end{aligned} \quad \dots(3)$$

Evidently $\int_a^b g_n(t) y(t) dt = C_n$ (say), is a constant and will be different for different values of n . Then (3) takes the form

$$y(x) = \lambda \sum_{n=1}^m C_n f_n(x) + F(x) \quad \dots(4)$$

This is a solution of (1) in which m constants C_1, C_2, \dots, C_m are to be determined.

Now multiplying both sides of (4) by $g_k(x)$ and integrating from a to b , we obtain

$$\int_a^b y(x) g_k(x) dx = \lambda \int_a^b \sum_{n=1}^m C_n f_n(x) g_k(x) dx + \int_a^b F(x) g_k(x) dx$$

Writing $\int_a^b g_k(x) f_n(x) dx = \alpha_{kn}$ and $\int_a^b g_k(x) F(x) dx = \beta_k$, the above equation becomes

$$\begin{aligned} C_k &= \lambda \sum_{n=1}^m C_n \alpha_{kn} + \beta_k \\ &= \lambda(C_1 \alpha_{k1} + C_2 \alpha_{k2} + \dots + C_m \alpha_{km}) + \beta_k \end{aligned}$$

Taking $k = 1, 2, \dots, m$, we get the following m equations which determine C_1, C_2, \dots, C_m :

$$\left. \begin{aligned} (1 - \lambda \alpha_{11}) C_1 - \lambda \alpha_{12} C_2 - \dots - \lambda \alpha_{1m} C_m &= \beta_1 \\ - \lambda \alpha_{21} C_1 + (1 - \lambda \alpha_{22}) C_2 - \dots - \lambda \alpha_{2m} C_m &= \beta_2 \\ \dots & \\ - \lambda \alpha_{m1} C_1 - \lambda \alpha_{m2} C_2 - \dots + (1 - \lambda \alpha_{mm}) C_m &= \beta_m \end{aligned} \right\} \quad \dots(5)$$

Equations (5) will give a unique solution if the determinant Δ of the coefficients of C_1, C_2, \dots, C_m is not zero.

Now the following cases arise :

I. When $F(x) = 0$, (1) is said to be a *homogeneous integral equation* and all β 's are zero.

(i) If $\Delta \neq 0$, the only solution of (4) is the trivial solution $C_1 = C_2 = \dots = C_m = 0$. Then $y(x) = 0$ is the trivial solution of (1).

(ii) If $\Delta = 0$, at least one of the C 's can be assigned any value and the remaining C 's can be found accordingly. Then (4) gives infinitely many solutions. The values of λ for which $\Delta = 0$ are known as the *eigen values*. Any non-trivial solution of the homogeneous integral equation for a certain value of λ is called the corresponding *eigen function*. The solutions corresponding to eigen values of λ can be expressed as arbitrary multiples of eigen functions.

II. When $F(x) \neq 0$. Let us assume that $\int_a^b g_m(x) F(x) dx = 0$ so that $\beta_m = 0$

(i) If $\Delta \neq 0$, the only solution of (i) is the trivial solution $C_1 = C_2 = \dots = C_m = 0$.

Then $y = F(x)$ is the desired solution of (1).

(ii) If $\Delta = 0$, atleast one of the C 's can be given any value and the remaining C 's can be found.

Then (4) gives infinitely many solutions.

III. When atleast one of the β 's $\neq 0$

(i) If $\Delta \neq 0$, then equations (5) give a unique solution of the constants C .

Hence there is a unique solution of (1).

(ii) If $\Delta = 0$, then equations (5) will be inconsistent.

\therefore Either there is no solution or infinitely many solutions of (i) exist.

Example 36.16. Find the eigen values and eigen functions of the following homogeneous integral equations with degenerate kernels :

$$(i) y(x) = \lambda \int_0^1 (2xt - 4x^2) y(t) dt \quad (ii) y(x) = \frac{1}{e^x - 1} \int_0^x e^{x+t} y(t) dt,$$

Solution. (i) Given equation may be written as

$$y(x) = \lambda \left\{ 2x \int_0^1 t y(t) dt - 4x^2 \int_0^1 y(t) dt \right\}$$

or

$$y(x) = (2\lambda x) C_1 - (4\lambda x^2) C_2 \quad \dots(i)$$

where $C_1 = \int_0^1 t y(t) dt$, $C_2 = \int_0^1 y(t) dt$

Substituting $y(x)$ in C_1 , C_2 we get

$$C_1 = \int_0^1 t [(2\lambda t) C_1 - (4\lambda t^2) C_2] dt$$

$$C_2 = \int_0^1 [(2\lambda t) C_1 - (4\lambda t^2) C_2] dt$$

or

$$C_1 \left\{ 1 - 2\lambda \int_0^1 t^2 dt \right\} + C_2 \left\{ 4\lambda \int_0^1 t^3 dt \right\} = 0$$

$$C_1 \left\{ -2\lambda \int_0^1 t dt \right\} + C_2 \left\{ 1 + 4\lambda \int_0^1 t^2 dt \right\} = 0$$

or

$$C_1 \left(1 - \frac{2\lambda}{3} \right) + \lambda C_2 = 0 ; -\lambda C_1 + C_2 (1 + 4\lambda/3) = 0 \quad \dots(ii)$$

\therefore The determinant of eigen values will be

$$\begin{vmatrix} 1 - 2\lambda/3 & \lambda \\ -\lambda & 1 + 4\lambda/3 \end{vmatrix} = 0 \text{ or } (\lambda + 3)^2 = 0$$

\therefore The eigen values are $\lambda_1 = -3$, $\lambda_2 = -3$

For $\lambda_1 = \lambda_2 = -3$, the equations (ii) reduce to

$$3C_1 - 3C_2 = 0 ; 3C_1 - 3C_2 = 0 \text{ i.e., } C_1 = C_2$$

\therefore From (i) $y(x) = -6C_1(x - 2x^2) = x - 2x^2$ if $C_1 = -1/6$

Hence the eigen function corresponding to $\lambda_1 = \lambda_2 = -3$, is

$$y(x) = x - 2x^2$$

(ii) Given integral equation may be written as

$$y(x) = \frac{e^x}{e^2 - 1} \int_0^1 e^t e^t \cdot y(t) dt = \frac{e^x}{e^2 - 1} C, \quad \dots(i)$$

where $C = \int_0^1 e^t y(t) dt$

Substituting the value of $y(t)$ from (i) in C , we get

$$C = \int_0^1 e^t \left(\frac{e^t C}{e^2 - 1} \right) dt = \frac{C}{e^2 - 1} \int_0^1 e^{2t} dt$$

or

$$C \left[1 - \frac{1}{e^2 - 1} \int_0^1 e^{2t} dt \right] = 0 \quad i.e. \quad C = 0$$

Hence from (i), $y(x) = 0$

which shows that the given integral equation has only trivial solution.

Thus it does not contain any eigen values or eigen functions.

Example 36.17. Solve the integral equation

$$y(x) = \cos x + \lambda \int_0^{\pi} \sin(x-t) y(t) dt.$$

Solution. Writing the given equation in the following form :

$$y(x) = \cos x + \lambda \left\{ \sin x \int_0^{\pi} \cos t \cdot y(t) dt - \cos x \int_0^{\pi} \sin t \cdot y(t) dt \right\}$$

or $y(x) = \cos x + (\lambda \sin x) C_1 - (\lambda \cos x) C_2 \quad \dots(ii)$

where $C_1 = \int_0^{\pi} \cos t \cdot y(t) dt, \quad C_2 = \int_0^{\pi} \sin t \cdot y(t) dt$

Substituting $y(x)$ in C_1 and C_2 , we get

$$C_1 = \int_0^{\pi} \cos t [\cos t + (\lambda \sin t) C_1 - (\lambda \cos t) C_2] dt$$

$$C_2 = \int_0^{\pi} \sin t [\cos t + (\lambda \sin t) C_1 - (\lambda \cos t) C_2] dt$$

or

$$\left. \begin{aligned} C_1 \left\{ 1 - \lambda \int_0^{\pi} \cos t \sin t dt \right\} + C_2 \left(\lambda \int_0^{\pi} \cos^2 t dt \right) &= \int_0^{\pi} \cos^2 t dt \\ C_1 \left\{ -\lambda \int_0^{\pi} \sin^2 t dt \right\} + C_2 \left\{ 1 + \lambda \int_0^{\pi} \sin t \cos t dt \right\} &= \int_0^{\pi} \sin t \cos t dt \end{aligned} \right\} \quad \dots(ii)$$

By evaluating each of the integrals in (ii), we get

$$C_1 + \frac{1}{2} C_2 \lambda \pi = \frac{1}{2} \pi; -\frac{1}{2} C_1 \lambda \pi + C_2 = 0 \quad \dots(iii)$$

The determinant of the equations (iii) is given by

$$\begin{vmatrix} 1 & \frac{1}{2} \lambda \pi \\ -\frac{1}{2} \lambda \pi & 1 \end{vmatrix} = 1 + \frac{1}{4} \lambda^2 \pi^2 \neq 0$$

Thus the equations (iii) have a unique solution

$$C_1 = \frac{2\pi}{4 + \lambda^2 \pi^2}; C_2 = \frac{\lambda \pi^2}{4 + \lambda^2 \pi^2}$$

Substituting these values of C_1 and C_2 in (i), we obtain the required solution

$$y(x) = \cos x + \frac{\lambda}{4 + \lambda^2 \pi^2} (2\pi \sin x - \lambda \pi^2 \cos x)$$

or

$$y(x) = \frac{2}{4 + \lambda^2 \pi^2} (2 \cos x + \pi \lambda \sin x).$$

PROBLEMS 36.4

Determine the eigen values and eigen functions for the following homogeneous integral equations with degenerate kernels :

1. $y(x) = \lambda \int_0^1 (3x - 2t) \cdot y(t) dt.$

2. $y(x) = \lambda \int_{-1}^1 (5x t^2 + 4x^2 t + 3xt) y(t) dt.$

3. $y(x) = \lambda \int_0^{\pi/4} \sin^2 x \cdot y(t) dt.$

4. $y(x) - \lambda \int_0^{2\pi} \sin x \cdot \sin t y(t) dt = 0. \quad (\text{Madras M.E., 2000 S})$

5. $y(x) = \lambda \int_0^{\pi} \sin x \cos t \cdot y(t) dt.$

6. $y(x) = \lambda \int_0^{2\pi} \sin(x+t) \cdot y(t) dt. \quad (\text{Madras M.E., 2000})$

Solve the following integral equations :

7. $y(x) = x + \lambda \int_0^1 (x-t) y(t) dt.$

8. $y(x) = x + \lambda \int_0^1 (1+x+t) y(t) dt.$

9. $y(x) = x + \lambda \int_0^2 (1 + \sin x \sin t) y(t) dt.$

10. $y(x) = (2x - \pi) + 4 \int_0^{\pi/2} \sin^2 x \cdot y(t) dt.$

11. $y(x) = \sin x + \lambda \int_0^{\pi/2} \sin x \cos t \cdot y(t) dt.$

12. $y(x) = x + \lambda \int_{-\pi}^{\pi} (x \cos t + t^2 \sin x + \cos x \sin t) y(t) dt.$

13. Obtain the solution of $y(x) = 1 + \lambda \int_0^1 xt \cdot y(t) dt$ in the form $y(x) = 1 + \frac{3\lambda x}{2(3-\lambda)}$ ($\lambda \neq 3$).

What happens when $\lambda = 3$?

14. For the integral equation

$$y(x) = F(x) + \lambda \int_0^1 (1 - 3xt) y(t) dt,$$

find the eigen values of λ and the corresponding eigen functions.

15. Obtain the most general solution of the equation

$$y(x) = F(x) + \lambda \int_0^{2\pi} \sin(x+t) y(t) dt$$

where (i) $F(x) = x$ (ii) $F(x) = 1$, under the assumption that $\lambda \neq \pm 1/\pi$.

36.11 SOLUTION OF FREDHOLM INTEGRAL EQUATION BY THE METHOD OF SUCCESSIVE APPROXIMATIONS

Consider the Fredholm equation $y(x) = F(x) + \lambda \int_a^b K(x, t) y(t) dt$... (1)

where $F(x)$ is continuous in $a \leq x \leq b$ and $K(x, t)$ is finite and continuous in the rectangle $a \leq x \leq b$ and $a \leq t \leq b$.

Replacing y under the integral sign by an initial approximation $y(0)$, we get the first approximation

$$y^{(1)}(x) = F(x) + \lambda \int_a^b K(x, t) y^{(0)}(t) dt \quad \dots (2)$$

Replacing y under the integral sign in (1) by $y^{(1)}$, we get the next approximation

$$y^{(2)}(x) = F(x) + \lambda \int_a^b K(x, t) y^{(1)}(t) dt \quad \dots (3)$$

Proceeding in this manner, we get the general formula for successive approximations as

$$y^{(n)}(x) = F(x) + \lambda \int_a^b K(x, t) y^{(n-1)}(t) dt \quad \dots(4)$$

We now, obtain the condition for the convergency of the sequence $y^{(n)}(x)$.

Replacing x by t and t by a dummy variable t_1 , (2) becomes

$$y^{(1)}(t) = F(t) + \lambda \int_a^b K(t, t_1) y^{(0)}(t_1) dt_1$$

Then (3) takes the form

$$\begin{aligned} y^{(2)}(x) &= F(x) + \lambda \int_a^b K(x, t) \left\{ F(t) + \lambda \int_a^b K(t, t_1) y^{(0)}(t_1) dt_1 \right\} dt \\ &= F(x) + \lambda \int_a^b K(x, t) F(t) dt + \lambda^2 \int_a^b K(x, t) \cdot \int_a^b K(t, t_1) y^{(0)}(t_1) dt_1 dt \end{aligned} \quad \dots(5)$$

Writing $K^* \phi(x) = \int_a^b K(x, t) \phi(t) dt$, the equations (1), (2) and (5) become

$$\begin{aligned} y(x) &= F(x) + \lambda K^* y(x) \\ y^{(1)}(x) &= F(x) + \lambda K^* y^{(0)}(x) \\ y^{(2)}(x) &= F(x) + \lambda K^* F(x) + \lambda^2 K^{*2} y^{(0)}(x) \end{aligned}$$

Similarly $y^{(3)}(x) = F(x) + \lambda K^* F(x) + \lambda^2 K^{*2} F(x) + \lambda^3 K^{*3} y^{(0)}(x)$

In general $y^{(n)}(x) = F(x) + \lambda K^* F(x) + \lambda^2 K^{*2} F(x) + \lambda^3 K^{*3} F(x) + \dots + \lambda^n K^{*n} y^{(0)}(x)$

As $n \rightarrow \infty$, we get

$$y(x) = \lim_{n \rightarrow \infty} y^{(n)}(x) = F(x) + \lim_{n \rightarrow \infty} (\lambda K^* F(x) + \lambda^2 K^{*2} F(x) + \dots) \quad \dots(6)$$

Now $F(x)$ and $K(x, t)$ being continuous for all values of x and t in (a, b) , $F(x) \leq M$ and $|K(x, t)| \leq m$ where M, m are their respective maximum values in (a, b) .

$$\begin{aligned} |K^* F(x)| &= \left| \int_a^b K(x, t) F(t) dt \right| \\ &\leq mM \left| \int_a^b dt \right| \leq mM(b-a) \end{aligned}$$

Similarly $K^{*r} F(x) \leq m^r M \cdot (b-a)^r$

$$\begin{aligned} |\lambda^r K^{*r} F(x)| &\leq |\lambda|^r \cdot m^r M(b-a)^r \\ &\leq M (|\lambda| m (b-a))^r \end{aligned}$$

$$\therefore \text{In (6), } \sum_1^\infty \lambda^r K^{*r} F(x) \leq M \sum_1^\infty (|\lambda| m (b-a))^r$$

Now the series on R.H.S. being a geometric series, converges for $|\lambda| m (b-a) < 1$.

Thus by comparison test, $\sum_1^\infty \lambda^r K^{*r} F(x)$ also converges for $|\lambda| m (b-a) < 1$

$$\text{i.e., for } |\lambda| < \frac{1}{m(b-a)} \quad \dots(7)$$

Hence the given integral equation (1) will have a continuous solution when the condition (7) is satisfied.

Obs. 1. To evaluate the successive terms in the series (6) conveniently, we choose $y^{(0)}(x) = F(x)$.

Obs. 2. Volterra integral equations can also be solved by following exactly similar procedure as above (See Example 36.19).

Example 36.18. Solve, by using the method of successive approximations, the integral equation

$$y(x) = 1 + \lambda \int_0^x xt y(t) dt \quad \dots(1)$$

Solution. Taking the initial approximation $y^{(0)}(x) = 1$ and substituting it in the R.H.S. of (i), we get

$$y^{(1)}(x) = 1 + \lambda \int_0^1 xt \cdot 1 dt = 1 + \lambda x \left| \frac{t^2}{2} \right|_0^1 = 1 + \frac{\lambda x}{2}$$

Substituting $y^{(1)}(x)$ in the R.H.S. of (i), we have

$$\begin{aligned} y^{(2)}(x) &= 1 + \lambda \int_0^1 xt \left(1 + \lambda \frac{t}{2} \right) dt = 1 + \lambda x \int_0^1 \left(t + \frac{\lambda t^2}{2} \right) dt \\ &= 1 + \lambda x \left| \frac{t^2}{2} + \frac{\lambda}{2} \cdot \frac{t^3}{3} \right|_0^1 = 1 + \frac{\lambda x}{2} + \frac{\lambda^2 x}{6} \end{aligned}$$

Substituting $y^{(2)}(x)$ in the R.H.S. of (i), we get

$$\begin{aligned} y^{(3)}(x) &= 1 + \lambda \int_0^1 xt \left(1 + \frac{\lambda t}{2} + \frac{\lambda^2 t^2}{6} \right) dt = 1 + \lambda x \left| \frac{t^2}{2} + \left(\frac{\lambda}{2} + \frac{\lambda^2}{6} \right) \frac{t^3}{3} \right|_0^1 \\ &= 1 + \frac{\lambda x}{2} + \frac{\lambda^2 x}{6} + \frac{\lambda^3 x}{18} = 1 + \frac{\lambda x}{2} \left(1 + \frac{\lambda}{3} + \frac{\lambda^2}{3^2} + \dots \right) \end{aligned}$$

Hence the solution of (i) is

$$y(x) = 1 + \frac{\lambda x}{2} \left(1 + \frac{\lambda}{3} + \left(\frac{\lambda}{3} \right)^2 + \left(\frac{\lambda}{3} \right)^3 + \dots \right)$$

As the number of terms tends to infinity, the exact solution is

$$\begin{aligned} y(x) &= 1 + \frac{\lambda x}{2} \left(1 + \frac{\lambda}{3} + \left(\frac{\lambda}{3} \right)^2 + \left(\frac{\lambda}{3} \right)^3 + \dots \right) \\ &= 1 + \frac{\lambda x}{2} \frac{1}{1 - \lambda/3} \quad [\text{Summing up the G.P. which converges for } \lambda/3 < 1] \\ y(x) &= 1 + \frac{3\lambda x}{2(3 - \lambda)} \quad \text{only if } \lambda < 3. \end{aligned}$$

Example 36.19. Using the method of successive approximations, solve the Volterra integral equation

$$y(x) = 1 + x + \int_0^x (x-t) y(t) dt,$$

Solution. Taking the initial approximation $y^{(0)}(x) = 1 + x$ and substituting it in the R.H.S. of (i), we get

$$\begin{aligned} y^{(1)}(x) &= 1 + x + \int_0^x (x-t)(1+t) dt \\ &= 1 + x + x \left(x + \frac{x^2}{2} \right) - \left(\frac{x^2}{2} + \frac{x^3}{3} \right) = 1 + x + \frac{x^2}{2} + \frac{x^3}{6} \end{aligned}$$

Substituting $y^{(1)}(x)$ in the R.H.S. of (i), we obtain

$$\begin{aligned} y^{(2)}(x) &= 1 + x + \int_0^x (x-t) \left(1 + t + \frac{t^2}{2} + \frac{t^3}{6} \right) dt \\ &= 1 + x + x \left(x + \frac{x^2}{2} + \frac{x^3}{6} + \frac{x^4}{24} \right) - \left(\frac{x^2}{2} + \frac{x^3}{3} + \frac{x^4}{8} + \frac{x^5}{30} \right) \\ &= 1 + x + \frac{x^2}{2} + \frac{x^3}{6} + \frac{x^4}{24} + \frac{x^5}{120} \end{aligned}$$

Proceeding in this manner, we get

$$y^{(n)}(x) = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \frac{x^4}{4!} + \frac{x^5}{5!} + \dots + \frac{x^n}{n!}$$

As $n \rightarrow \infty$, the exact solution of (i) is

$$y(x) = \lim_{n \rightarrow \infty} \left(1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots + \frac{x^n}{n!} \right) = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \cdots \infty = e^x.$$

PROBLEMS 36.5

Apply the method of successive approximations, to solve the following Fredholm integral equations : (1 to 3)

1. $y(x) = 1 - \lambda \int_0^1 xt y(t) dt.$

2. $y(x) = \sin x + \lambda \int_0^{2\pi} \cos(x+t) y(t) dt.$

3. $y(x) = 1 + \lambda \int_0^1 (1 - 3xt) y(t) dt.$

Using the iterative method, solve the following Volterra integral equations : (4 to 6)

4. $y(x) = 1 + \int_0^x y(t) dt. \quad (\text{Madras M.E., 2000 S})$

5. $y(x) = 1 + x - \int_0^x y(t) dt.$

6. $y(x) = x + \int_0^x (t-x) y(t) dt.$

7. $y(x) = 2(1+x^2) - \int_0^x xy(t) dt,$

8. Choosing the initial approximation $y^{(0)}(x) = 0$, for the solution of the integral equation

$$y(x) = \int_0^x t(t-x) y(t) dt + \frac{x^2}{2}, \text{ show that } y^{(2)}(x) = \frac{x^2}{2} - \frac{x^5}{40}.$$

9. Starting with the initial approximation $y^{(0)}(x) = 1$, for the solution of the integral equation

$$y(x) = 1 + \int_0^x (x+t) y(t) dt,$$

show that $y^{(3)}(x) = 1 + \frac{3x^2}{2} + \frac{7x^4}{8} + \frac{77x^6}{240}$.

(Madras M.E., 2000)

I. SET THEORY

37.1 SETS

(1) The concept and the language of sets play a very important role in expressing mathematical ideas concisely and precisely. It was Cantor* who first introduced and developed the notion of sets in mathematical investigations. It is, therefore, essential for a student of engineering to grasp the basic ideas of *Set Theory*.

Def. A collection of objects defined by some property, is called a **set**. The objects belonging to a set are called its **elements or members**.

Examples of a set are (i) the set of positive integers less than 25, (ii) set of pages in a book, and (iii) set of women students in a college.

A set is denoted by a single capital letter e.g. A, B, \dots, S, X, Y and the elements of a set are generally denoted by small letters a, b, c, \dots, x, y, z .

When e is an element of a set S , we write $e \in S$ and read as ' e belongs to S '. When e is not an element of S , we write $e \notin S$.

If S be a set of odd integers, $3, 7, 11 \in S$ but $4, 6 \notin S$.

(2) Representation of a set

(i) **Tabular form of a set.** In this, the elements are enclosed in curly brackets after separating them by commas, e.g., the set of positive even integers less than 9 is written as $S = \{2, 4, 6, 8\}$ and the set of prime numbers between 4 and 14 is $T = \{5, 7, 11, 13\}$.

(ii) **Symbolic form of a set.** In this, the set is written as $\{x/P(x)\}$ where x is a typical element of the set and $P(x)$ is the property satisfied by this element. In symbolic form, the above two sets are

$$S = \{x/x = \text{a positive even number } < 9\}$$

$$T = \{x/x = \text{a prime number between 4 and 14}\}.$$

*The great German mathematician George Cantor (1845–1918), the creator of Set theory.

(3) Empty set or null set. A set which has no elements is called an **empty set** or the **null set** and is denoted by the symbol \emptyset .

(4) Finite and infinite sets. A set is said to be **finite** if it has a finite number of elements. Otherwise a set is said to be **infinite**.

The number of distinct elements in a finite set A is called its **cardinality** and is denoted by $|A|$.

For instance, the set of days in a year is **finite**, the set of points in a line is an **infinite set**.

(5) Subset. If every element of a set A is also an element of set B , then A is called a **subset** of B and this relationship is denoted by $A \subset B$ or $B \supset A$; which is read as ' A is contained in B '.

Another definition : If A and B are two sets such that

$$x \in A \Rightarrow x \in B,$$

then A is called a subset of B .

The notation \Rightarrow stands for the word 'implies'.

For instance, the set V of vowels is a subset of the set A of the English alphabet and we write $V \subset A$.

(6) Power set. For a set A , collection of all subsets of A is called the **power set** of A and is denoted by $P(A)$.

If $A = \{1, 2, 3\}$ then $P(A)$ consists of 2^3 i.e. 8 elements $\emptyset, \{1\}, \{2\}, \{3\}, \{1, 2\}, \{2, 3\}, \{3, 1\}$ and $\{1, 2, 3\}$.

In general, if A has n elements, then $P(A)$ has 2^n elements.

(7) Equality of sets. Two sets A and B are said to be equal if the elements of both are the same i.e., if each element of A is also an element of B and vice versa, and we write $A = B$.

In other words, if A and B are two sets such that

$$A \subset B \text{ and } B \subset A \Leftrightarrow A = B.$$

Here \Leftrightarrow stands for 'implies and is implied by' or 'if and only if'.

For instance, $\{2, 3, 5\} = \{3, 2, 5, 3\} = \{2, 5, 3, 2\}$, since the change in the order of elements or the repetition of an element is immaterial and all these contain the same elements 2, 3, 5.

(8) Proper and improper subsets. When the set B contains all the elements of A and some others, A is said to be a **proper subset** of B and is denoted by $A \subsetneq B$.

i.e., if $A \subset B$ and $A \neq B$ then $A \subsetneq B$.

If $A \subset B$ and every element of B is also an element of A i.e., $B \subset A$, then A is said to be an **improper subset** of B i.e., $A = B$.

For instance, the set of positive odd integers and the set of positive even integers are both proper subsets of the set of natural numbers.

(9) Universal set is that which has all the sets under investigation as its subsets. It is generally denoted by ' U '.

For instance the set of all letters of English alphabet is a universal set of the sets of the form $\{a, i, e, u\}, \{b, x, u, m\}$ etc.

Example 37.1. If A, B, C are sets such that $A \subset B$ and $B \subset C$, then show that $A \subset C$.

Solution. Let x be any element of A .

Since $A \subset B$ i.e., all the elements of A belong to B ,

$$\text{so } x \in A \Rightarrow x \in B \quad \dots(i)$$

Again as $B \subset C$ i.e., all elements of B belong to C ,

$$\text{so } x \in B \Rightarrow x \in C \quad \dots(ii)$$

\therefore It follows from (i) and (ii) that $x \in A \Rightarrow x \in C$

$$\text{i.e., } A \subset C.$$

Example 37.2. Which of the following sets are equal?

$$S_1 = \{1, 2, 2, 3\}, S_2 = \{x : x^2 - 2x + 1 = 0\}$$

$$S_3 = \{3, 2, 1\} \text{ and } S_4 = \{x : x^3 - 6x^2 + 11x - 6 = 0\}.$$

Solution. Here $S_1 = \{1, 2, 2, 3\} = \{1, 2, 3\}$

$$S_2 = \{x : (x - 1)^2 = 0\} = \{1\}, S_3 = \{1, 2, 3\}$$

$$S_4 = \{x : (x - 1)(x - 2)(x - 3) = 0\} = \{1, 2, 3\}$$

From these we find that S_1, S_3, S_4 are equal.

37.2 SET OPERATIONS

(1) **Union** of two sets A and B is the set of all elements which belong to A or to B or to both. It is denoted by $A \cup B$ read as 'A union B' and is represented by the shaded portion in Fig. 37.1.

Symbolically $A \cup B = \{x/x \in A \text{ or } x \in B\}$.

Fig. 37.1

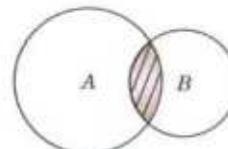

Fig. 37.2

(2) **Intersection** of two sets A and B is the set of elements which are common to both A and B . It is denoted by $A \cap B$ read as 'A intersection B' and is represented by the shaded portion in Fig. 37.2.

Symbolically $A \cap B = \{x/x \in A \text{ and } x \in B\}$

Such diagrams as Figs. 37.1 and 37.2 which exhibit the various relations between the sets are known as **Venn diagrams**.

(3) **Disjoint sets.** If the sets A and B have no common elements, they are called **disjoint sets**. Their intersection is an empty set.

For instance, if A be a set of boys in a college and B the set of girls in the same college, then A and B are disjoint sets i.e. $A \cap B = \emptyset$.

(4) **Complement of a set.** If $B \subset A$, the set of elements of A which are not in B is called the **complement of B in A** and is denoted by B^c in A . It is also known as the difference $A - B$ of sets A and B . Thus

$$B^c \text{ in } A = \{x/x \in A \text{ and } x \notin B\}$$

which is shown shaded in Fig. 37.3 (i).

If U be a universal set, then the set ' $U - A$ ' is called the **complement of A** and is denoted by A^c , which is shown shaded in Fig. 37.3 (ii).

For instance, if $U = \{1, 2, 3, 4, 5, \dots\}$ and $A = \{1, 3, 5, 7, \dots\}$, then $A^c = \{2, 4, 6, 8, \dots\}$.

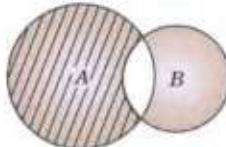

Fig. 37.3 (i)

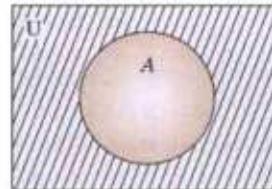

Fig. 37.3 (ii)

(5) **Cartesian product** of two sets A and B denoted by $A \times B$ is defined to be set of all ordered pairs (a, b) , where $a \in A$ and $b \in B$ i.e.,

$$A \times B = \{(a, b) : a \in A \text{ and } b \in B\}$$

For instance if $A = \{1, 2\}$, $B = \{1, 2, 3\}$, then $A \times B = \{(1, 1), (1, 2), (1, 3), (2, 1), (2, 2), (2, 3)\}$, $B \times A = \{(1, 1), (1, 2), (2, 1), (2, 2), (3, 1), (3, 2)\}$ $\therefore A \times B \neq B \times A$.

Example 37.3. If $A = \{2, 5, 6, 7\}$, $B = \{0, 2, 5, 7, 8\}$, $C = \{1, 2, 3, 5, 6\}$, show that

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C).$$

Solution. Here

$$B \cap C = \{2, 5\}$$

$$A \cup (B \cap C) = \{2, 5, 6, 7\} \quad \dots(i)$$

Again

$$A \cup B = \{0, 2, 5, 6, 7, 8\},$$

$$A \cup C = \{1, 2, 3, 5, 6, 7\}$$

$$\therefore (A \cup B) \cap (A \cup C) = \{2, 5, 6, 7\} \quad \dots(ii)$$

Hence from (i) and (ii), we get

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C).$$

Example 37.4. With the help of Venn diagram, show that

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C).$$

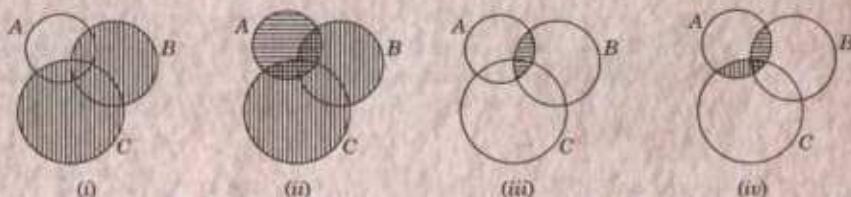

Fig. 37.4

Solution. First we draw vertical lines in the whole areas of B and C so as to represent $B \cup C$ [Fig. 37.4 (i)].

Now draw horizontal lines in the whole area A . Thus the double hatched area in [Fig. 37.4 (ii)] represents area common to A and $B \cup C$ i.e., $A \cap (B \cup C)$.

Again we draw horizontal lines in the area common to A and B so as to represent $A \cap B$ [Fig. 37.4 (iii)].

Now draw vertical lines in the area common to A and C , so as to represent $A \cap C$. Then the whole hatched area in [Fig. 37.4 (iv)] represents $(A \cap B) \cup (A \cap C)$.

Hence we observe that the double hatched area in Fig. 37.4 (ii) is equal to the total hatched area in Fig. 37.4 (iv).

Example 37.5. Prove that (i) $A - (B \cap C) = (A - B) \cup (A - C)$.

$$(ii) A \times (B \cap C) = (A \times B) \cap (A \times C).$$

(Tiruputi, 2001)

Solution. (i) Let x be an arbitrary element of the set $A - (B \cap C)$, then

$$\begin{aligned} x \in A - (B \cap C) &\Rightarrow x \in A \text{ and } x \notin (B \cap C) \quad [\because x \notin (A - B) \Rightarrow x \in A \text{ and } x \notin B] \\ &\Rightarrow x \in A \text{ and } (x \notin B \text{ or } x \notin C) \\ &\Rightarrow (x \in A \text{ and } x \notin B) \text{ or } (x \in A \text{ and } x \notin C) \\ &\Rightarrow x \in (A - B) \text{ or } x \in (A - C) \\ &\Rightarrow x \in (A - B) \cup (A - C). \end{aligned}$$

$$\therefore A - (B \cap C) \subset (A - B) \cup (A - C) \quad \dots(i)$$

Again if x be an arbitrary element of the set $(A - B) \cup (A - C)$, then

$$\begin{aligned} x \in (A - B) \cup (A - C) &\Rightarrow x \in (A - B) \text{ or } x \in (A - C) \\ &\Rightarrow (x \in A \text{ and } x \notin B) \text{ or } (x \in A \text{ and } x \notin C) \\ &\Rightarrow x \in A \text{ and } (x \notin B \text{ or } x \notin C) \\ &\Rightarrow x \in A \text{ and } x \notin B \cap C \\ &\Rightarrow x \in A - (B \cap C) \end{aligned}$$

$$\therefore (A - B) \cup (A - C) \subset A - (B \cap C) \quad \dots(ii)$$

From (i) and (ii), we get $A - (B \cap C) = (A - B) \cup (A - C)$.

$$(ii) (x, y) \in A \times (B \cap C)$$

$$\begin{aligned} &\Rightarrow x \in A \text{ and } y \in (B \cap C) \\ &\Rightarrow (x \in A \text{ and } y \in B) \text{ and } (x \in A \text{ and } y \in C) \\ &\Rightarrow (x, y) \in (A \times B) \text{ and } (x, y) \in (A \times C) \\ &\Rightarrow (x, y) \in (A \times B) \cap (A \times C) \end{aligned}$$

Hence $A \times (B \cap C) = (A \times B) \cap (A \times C)$.

37.3 LAWS OF SET THEORY

1. Commutative Law

$$A \cup B = B \cup A; A \cap B = B \cap A.$$

2. Associative Law

$$A \cup (B \cup C) = (A \cup B) \cup C$$

$$A \cap (B \cap C) = (A \cap B) \cap C$$

3. Distributive Law

$$A \cap (B \cup C) = (A \cap B) \cup (A \cap C)$$

$$A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$$

4. Complement Law

$$A \cup A^c = U; A \cap A^c = \emptyset.$$

5. Identity Law

$$A \cup \emptyset = A = \emptyset \cup A$$

$$A \cap U = A = U \cap A.$$

6. Absorption Law

$$A \cup (A \cap B) = A; A \cap (A \cup B) = A$$

7. De Morgan's Law

$$(A \cup B)^c = A^c \cap B^c; (A \cap B)^c = A^c \cup B^c$$

8. Involution Law

$$(A^c)^c = A.$$

37.4 PRINCIPLE OF INCLUSION

(1) If A and B be sets with cardinalities $|A|$ and $|B|$, then

$$|A \cup B| = |A| + |B| - |A \cap B|$$

Proof. The number of common elements in A and B is $|A \cap B|$. Each of these elements is counted twice in $|A| + |B|$, once in $|A|$ and once in $|B|$. This should be adjusted by subtracting the term $|A \cap B|$ from $|A| + |B|$.

Hence $|A \cup B| = |A| + |B| - |A \cap B|$.

Obs. Using the distributive law, we can extend the above result for three sets A, B, C so that

$$|A \cup B \cup C| = |A| + |B| + |C| - |A \cap B| - |B \cap C| - |C \cap A| + |A \cap B \cap C|$$

(V.T.U., 2002)

$$\begin{aligned} \text{For } |A \cup B \cup C| &= |(A \cup B) \cup C| \\ &= |A \cup B| + |C| - |(A \cup B) \cap C| \\ &= |A| + |B| - |A \cap B| + |C| - |(A \cap C) \cup (B \cap C)| \\ &= |A| + |B| + |C| - |A \cap B| - |A \cap C| + |B \cap C| - |A \cap B \cap C| \end{aligned}$$

whence follows the result.

(2) Duality. If S be any identity involving sets and operations (e.g. complement, intersection \cap and union \cup etc.) and a new set S^* is obtained by replacing \cap by \cup , \cup by \cap , \emptyset by U and U by \emptyset in S , then the statement S^* is true and is called the **dual** of the statement S .

For instance, the dual of $A \cap (B \cup A) = A$ is $A \cup (B \cap A) = A$.

Example 37.6. In a survey conducted on 250 persons, it was found that 180 drink tea and 70 drink coffee and 50 take both tea and coffee. How many drink atleast one beverage and how many drink neither?

Solution. Let A be the set of tea drinkers and B the set of coffee drinkers. Then

$$|A \cup B| = |A| + |B| - |A \cap B| = 180 + 70 - 50 = 200$$

Hence 200 persons drink at least one beverage and $250 - 200 = 50$ persons drink neither tea nor coffee.

Example 37.7. How many integers between 1 and 468 are divisible by 3 but not by 5.

Solution. Number of integers between 1 and 468 which are divisible by 3 = $\left[\frac{468}{3} \right] = 156$

Number of integers between 1 and 468 which are divisible by 3 and 5 = $\left[\frac{468}{3 \times 5} \right] = 31$

Hence the number of integers between 1 and 468 divisible by 3 but not by 5 = $156 - 31 = 125$.

Example 37.8. How many integers are between 1 and 200 which are divisible by any one of the integers 2, 3 and 5?

Solution. Let A_1, A_2, A_3 denote the set of integers between 1 and 200 which are divisible by 2, 3, 5 respectively.

$$|A_1| = \left[\frac{200}{2} \right] = 100, |A_2| = \left[\frac{200}{3} \right] = 66, |A_3| = \left[\frac{200}{5} \right] = 40$$

$$|A_1 \cap A_2| = \left[\frac{200}{2 \times 3} \right] = 33, |A_1 \cap A_3| = \left[\frac{200}{2 \times 5} \right] = 20$$

$$|A_2 \cap A_3| = \left[\frac{200}{3 \times 5} \right] = 13, |A_1 \cap A_2 \cap A_3| = \left[\frac{200}{2 \times 3 \times 5} \right] = 6$$

$$\begin{aligned} \text{Hence } |A_1 \cup A_2 \cup A_3| &= |A_1| + |A_2| + |A_3| - |A_1 \cap A_2| \\ &\quad - |A_2 \cap A_3| - |A_3 \cap A_1| + |A_1 \cap A_2 \cap A_3| \\ &= 100 + 66 + 40 - 33 - 13 - 20 + 6 = 146. \end{aligned}$$

PROBLEMS 37.1

1. Show that the following sets are equal :

$$A = \{2, 1\}, B = \{1, 2, 1, 2, 1, 2\}, C = \{x : x^2 - 3x + 2 = 0\}.$$

2. Which of the following statements are true ? Give reason to support your answer.

(i) $\{a\} \subset \{a, b, c\}$	(ii) $a \subset \{a, b, c\}$	(iii) $a \subseteq \{a, b, c\}$
(iv) $\{a, b\} \subset \{a, b, c\}$	(v) $\{a, b\} \in \{a, b, c\}$	(vi) $\emptyset \subset \{a, b, c\}$.

3. Prove that

(i) $B - A$ is a subset of A^c .	(ii) $B - A^c = B \cap A$
(iii) $\{A \subset B, B \subset C, C \subset A\} \Rightarrow A = C$.	

(Andhra, 2004)

4. If $A = \{a, b, c, d, e\}$, $B = \{a, c, e, g\}$ and $C = \{b, e, f, g\}$, prove that

(i) $(A \cup B) \cap C = (A \cap C) \cup (B \cap C)$	(ii) $(A \cap B) \cup (A \cap C) = A \cap (B \cup C)$.
--	---

5. If $A = A \cup B$ then prove that $B = A \cap B$.

6. Prove that $A \cup B = B \Leftrightarrow A \subset B$.

7. With the help of the Venn-diagram, prove that

(i) $(A \cup B)^c = A^c \cap B^c$ and $(A \cap B)^c = A^c \cup B^c$.	
(ii) $A \cup (B \cap C) = (A \cup B) \cap (A \cup C)$.	

(Andhra, 2004)

(V.T.U., 2001 S)

8. If $B \subset A$, prove that

(i) $B \cup C \subset A \cup C$	(ii) $B \cap C \subset A \cap C$.
---------------------------------	------------------------------------

9. (i) If $A \cup B = A \cap B$, show that $A = B$.

(ii) If $A \cup B = A \cup C$ and $A \cap B = A \cap C$, show that $B = C$.	
---	--

10. (i) Prove that (i) $A - B = A - A \cap B$.

(ii) $A - (B \cup C) = (A - B) \cap (A - C)$.	
--	--

(V.T.U., 2001 ; Madras, 2000)

11. Show that for any two sets A and B

(i) $A - B = A \cap B^c$	(ii) $A \subseteq B \Leftrightarrow B^c \subseteq A^c$
(iii) $A \cup B = (A \cap \bar{B}) \cup (B \cap \bar{A}) \cup (A \cap B)$.	

12. If A, B, C be sets such that $A \subset B, B \cap C = \emptyset$, show that $A \cap C = \emptyset$.

13. Show that $A \cup (B \cup C)^c = (A \cup B^c) \cap (A \cup C^c)$.

14. Prove that $A \times (B \cup C) = (A \times B) \cup (A \times C)$. (Andhra, 2001)
15. If S is any set and $P(s)$ is its power set and A and B belong to $P(s)$, prove that $B \cap (A - B) = \emptyset$.
16. If A and B are finite sets then prove that $A \cup B$ and $A \cap B$ are finite sets and

$$n(A \cup B) = n(A) + n(B) - n(A \cap B).$$
 (Andhra, 2004)
17. In survey conducted on 200 people, it was found that 140 are smokers while 80 are alcoholic and 40 are both smokers and alcoholics. Find how many are neither smokers nor alcoholics.
18. How many integers between 1 and 789 are divisible by 5 but not by 7.
19. How many integers are between 1 and 250 which are divisible by any of the integers 3, 5, and 7.
20. Out of a class of 153 students, 54 have taken History, 63 have taken Geography, 62 have taken Economics, and 43 have taken Geography and History, 45 have taken History and Economics, 46 have taken Geography and Economics and 37 have taken all the three subjects. How many of the students have not taken any of these three subjects? Use a Venn diagram.

II. ALGEBRA OF LOGIC

37.5 INTRODUCTION

(1) Logic is concerned with all types of reasoning such as valid statements, mathematical proofs, valid conclusions etc. Logical reasoning is used to prove theorems, to verify the correctness of computer programs and to draw conclusions from experiments. Later on, we shall observe that the algebra of sets and logic is analogous to the algebra of switching circuits which is similar to 'Boolean Algebra'.

(2) **Propositions and Statements.** A *proposition* is a declarative sentence which is either true (1) or false (0). Some authors use *T* and *F* respectively for 1 and 0. The truth or falsity of a proposition is defined as its *truth value*.

All the declarative sentences to which it is possible to assign one and only one of the two possible truth values are called *statements*.

Example 37.9. Which of the following are statements : (a) Agra is in India (b) $3 + 4 = 5$ (c) Where do you live ? (d) Do you speak Hindi ?

Solution. (a) and (b) are statements that happen (a) is true and (b) is false.

(c) and (d) are questions so they are not statements.

(3) **Compound statements.** The statement which is composed of sub-statements and logical connectives is called a *compound statement*.

e.g., 'It is raining and it is cold' is a compound statement as it is comprised of two sub-statements 'It is raining' and 'it is cold'.

(4) **Truth table.** The truth value of a compound statement is completely determined by the truth value of its substatements. A convenient way to represent a compound statement is by means of the **truth table** wherein the values of a compound statement are specified for all possible choices of the values of the sub statements.

We shall use the numbers 0 and 1 to denote the false and true statements. Also we use letters p, q, r, \dots to represent a proposition or logical variable.

37.6 LOGICAL OPERATORS

(1) **Conjunction.** If p and q are two statements then their conjunction p and q written as $p \wedge q$, is defined by the truth table I.

Table 1

p	q	$p \wedge q$
1	1	1
1	0	0
0	1	0
0	0	0

Table 2

p	q	$p \vee q$
1	1	1
1	0	1
0	1	1
0	0	0

For example, the conjunction of p : it is raining and q : I am cold is $p \wedge q$: It is raining and I am cold.

(2) Disjunction. If p and q are two statements, then their disjunction p or q written as $p \vee q$ is defined by the truth table 2.

For example, the disjunction of p and q for p : it is raining today; q : 3 is an odd integer is $p \vee q$: it is raining today or 3 is an odd integer.

(3) Negation. If p is a given statement and its negative 'not p ', written as $\neg p$ (or Np or $\neg p$) is defined by the following truth table :

p	$\neg p$
0	1
1	0

For example, the negation of the following statement

(a) p : $2 + 3 > 1$ is $\neg p$: $2 + 3 \leq 1$

(b) q : it is hot is $\neg q$: it is cold.

Example 37.10. If p be 'it is hot' and q be 'it is raining', describe each of the following statements by a sentence :

(a) $q \vee \neg p$ (b) $\neg p \wedge \neg q$ (c) $\neg(\neg p \vee q)$.

Solution. (a) It is raining or it is not hot. (b) It is not hot and it is not raining.

(c) It is hot but not raining.

(4) Conditional operator. The conditional statement 'if p then q ' written as $p \rightarrow q$ is defined by the truth table 4 :

Table 4

p	q	$p \rightarrow q$
1	1	1
1	0	0
0	1	1
0	0	1

Table 5

p	q	$p \leftrightarrow q$
1	1	1
1	0	0
0	1	0
0	0	1

Obs. The contrapositive of conditional statement $p \rightarrow q$ is the statement $\neg p \rightarrow \neg q$.

(5) Biconditional operator. If p and q be two statements, then the statement ' p if and only if q ' denoted by $p \leftrightarrow q$ and abbreviated as ' p if q ' is called a *biconditional statement*. The truth table for biconditional statement is table 5.

Example 37.11. Construct the truth tables for

- | | |
|--|---|
| (a) $p \wedge \neg q$ | (b) $(p \vee q) \wedge \neg p$ |
| (c) $(p \rightarrow q) \wedge (q \rightarrow p)$ | (d) $(p \rightarrow q) \vee \neg(p \leftrightarrow \neg q)$. |

Solution. (a) The truth table is

p	q	$\neg q$	$p \wedge \neg q$
1	1	0	0
1	0	1	1
0	1	0	0
0	0	1	0

(b) The truth table is

p	q	$p \vee q$	$\neg p$	$(p \vee q) \wedge \neg p$
1	1	1	0	1
1	0	1	0	1
0	1	1	1	1
0	0	0	1	0

(c) The truth table is

p	q	$p \rightarrow q$	$q \rightarrow p$	$(p \rightarrow q) \wedge (q \rightarrow p)$
1	1	1	1	1
1	0	0	1	0
0	1	1	0	0
0	0	1	1	1

(d) The truth table in this case is

p	q	$p \rightarrow q$	$\neg q$	$p \rightarrow \neg q$	$(p \rightarrow \neg q)$	$p \rightarrow q \vee \neg(p \rightarrow \neg q)$
1	1	1	0	0	1	1
1	0	0	1	1	0	0
0	1	1	0	1	0	1
0	0	1	1	0	1	1

37.7 STATEMENTS GENERATED BY A SET

(1) If S be a set of statements, then any valid combination of statements in S with conjunction, disjunction or negation is a statement generated by S .

A statement generated by a set S need not include each element of S in its expression.

For example, if p, q, r are statements in S then

(a) $(p \wedge q) \wedge r$

(b) $\neg q \wedge r$

(c) $(p \wedge q) \vee (\neg q \wedge r)$

are statements generated by S . Their truth tables are :

p	q	r	$p \wedge q$	$(p \wedge q) \wedge r$ (a)	$\neg q$	$\neg q \wedge r$ (b)	(c)
1	1	1	1	1	0	0	1
1	1	0	1	0	0	0	1
1	0	1	0	0	1	1	1
0	1	1	0	0	0	0	0
1	0	0	0	0	1	0	0
0	1	0	0	0	0	0	0
0	0	1	0	0	1	1	1
0	0	0	0	0	1	0	0

(2) **Tautology** is an expression involving logical variables which is true for all cases in its truth table. It is also called a *logical truth*.

(3) **Contradiction** is an expression involving logical variables which is false for all cases in its truth table. Obviously, the negation of a contradiction is a tautology.

In other words, a statement formula which is a tautology is identically true, while a formula which is a contradiction is identically false.

Obs. The conjunction of two tautologies is also a tautology.

Example 37.12. Show that (a) $p \vee \neg p$ is a tautology (b) $p \rightarrow q \leftrightarrow (\neg p \vee q)$.

Solution. (a) The truth table is

p	$\neg p$	$p \vee \neg p$
1	0	1
0	1	1

Hence $p \vee \neg p$ is a tautology.

(b) The truth table is

p	q	$p \rightarrow q$	$\neg p$	$\neg p \vee q$	$(p \rightarrow q) \leftrightarrow (\neg p \vee q)$
1	1	1	0	1	1
1	0	0	0	0	1
0	1	1	1	1	1
0	0	1	1	1	1

Hence $(p \rightarrow q) \leftrightarrow (\neg p \vee q)$ is true.

37.8 EQUIVALENCE

(1) If p and q be statements generated by the set of statements S , then p and q are equivalent if $p \leftrightarrow q$ is a tautology which is denoted by $p \Leftrightarrow q$.

If $p \rightarrow q$ is a tautology, then we say that p implies q and write it as $p \Rightarrow q$.

Obs. All tautologies are equivalent to each other and all contradictions are equivalent to each other.

(2) Equivalent formulae. Some basic equivalent formulae are given below which can be proved by using truth tables :

1. $p \vee p \Leftrightarrow p$	$p \wedge p \Leftrightarrow p$	Idempotent laws
2. $p \vee q \Leftrightarrow q \vee p$	$p \wedge q \Leftrightarrow q \wedge p$	Commutative laws
3. $(p \vee q) \vee r \Leftrightarrow p \vee (q \vee r)$	$(p \wedge q) \wedge r \Leftrightarrow p \wedge (q \wedge r)$	Associative laws
4. $p \vee (q \wedge r) \Leftrightarrow (p \vee q) \wedge (p \vee r)$	$p \wedge (q \vee r) \Leftrightarrow (p \wedge q) \vee (p \wedge r)$	Distributive laws
5. $p \vee \neg p \Leftrightarrow 1$	$p \wedge \neg p \Leftrightarrow 0$	Negation law
6. $p \vee 0 \Leftrightarrow p$	$p \wedge 1 \Leftrightarrow p$	Identity laws
7. $p \vee 1 \Leftrightarrow 1$	$p \wedge 0 \Leftrightarrow 0$	Null laws
8. $p \vee (p \wedge q) \Leftrightarrow p$	$p \wedge (p \vee q) \Leftrightarrow p$	Absorption laws
9. $\neg(p \vee q) \Leftrightarrow \neg p \wedge \neg q$	$\neg(p \wedge q) \Leftrightarrow \neg p \vee \neg q$	De Morgan's laws
10. $p \Rightarrow p \vee q$	$q \Rightarrow p \vee q$	Disjunctive addition
11. $p \wedge q \Rightarrow q$	$p \wedge q \Rightarrow p$	
12. $(p \vee q) \wedge \neg p \Rightarrow q$	$(p \vee q) \wedge \neg q \Rightarrow p$	
13. $(p \rightarrow q) \wedge (q \rightarrow r) \Rightarrow (p \rightarrow r)$		Chain rule
14. $p \rightarrow q \Leftrightarrow \neg p \vee q$		Conditional equivalence
15. $p \Leftrightarrow q \Leftrightarrow (p \rightarrow q) \wedge (q \rightarrow p)$		Biconditional equivalence

Example 37.13. Show that

$$(a) p \rightarrow (q \rightarrow r) \Leftrightarrow p \rightarrow (\neg q \vee r) \Leftrightarrow (p \wedge q) \rightarrow r$$

$$(b) [\neg p \wedge (\neg q \wedge r)] \vee (q \wedge r) \vee (p \wedge r) \Leftrightarrow r$$

Solution. (a) By conditional equivalence $q \rightarrow r \Leftrightarrow \neg q \vee r$

Replacing $q \rightarrow r$ by $\neg q \vee r$, we get $p \rightarrow (\neg q \vee r)$ which is equivalent to $\neg p \vee (\neg q \vee r)$ by the same rule.

Thus

$$\begin{aligned} \neg p \vee (\neg q \vee r) &\Leftrightarrow (\neg p \vee \neg q) \vee r && \text{[By (3)]} \\ &\Leftrightarrow \neg(p \wedge q) \vee r && \text{[By (9)]} \\ &\Leftrightarrow (p \wedge q) \rightarrow r && \text{[By (14)]} \end{aligned}$$

$$(b) [\neg p \wedge (\neg q \wedge r)] \vee (q \wedge r) \vee (p \wedge r)$$

$$\begin{aligned} &\Leftrightarrow [\neg p \wedge (\neg q \wedge r)] \vee (q \vee p) \wedge r && \text{[By (4)]} \\ &\Leftrightarrow [\neg p \wedge \neg q \wedge r] \vee (q \vee p) \wedge r && \text{[By (3)]} \\ &\Leftrightarrow [\neg(p \vee q) \wedge r] \vee (q \vee p) \wedge r && \text{[By (9)]} \\ &\Leftrightarrow [\neg(p \vee q) \vee (p \vee q)] \wedge r && \text{[By (4)]} \\ &\Leftrightarrow 1 \wedge r && \text{[By (5)]} \\ &\Leftrightarrow r && \text{[By (6)]} \end{aligned}$$

37.9 DUALITY LAW

(1) Two formulae A and A^* are said to be duals of each other if either one can be obtained from the other by replacing \wedge by \vee and \vee by \wedge .

If the formula A contains special variables 1 or 0, then its dual A^* is obtained by replacing 1 by 0 and 0 by 1.

- e.g., (i) Dual of $(p \vee q) \wedge r$ is $(p \wedge q) \vee r$
(ii) Dual of $(p \wedge q) \vee 0$ is $(p \vee q) \wedge 1$.

(2) **Tautology implications.** A statement A is said to tautologically imply a statement B if and only if $A \rightarrow B$ is a tautology which is read as "A implies B".

The implications listed below have important applications which can be proved by truth tables :

- | | |
|---|--|
| 1. $p \wedge q \Rightarrow p$ | $p \Rightarrow p \vee q$ |
| 2. $\neg p \Rightarrow p \rightarrow q$ | $q \Rightarrow p \rightarrow q$ |
| 3. $\neg(p \rightarrow q) \Rightarrow p$ | $\neg(p \rightarrow q) \Rightarrow \neg q$ |
| 4. $p \wedge (p \rightarrow q) \Rightarrow q$ | $\neg p \wedge (p \vee q) \Rightarrow q$ |
| 5. $(p \rightarrow q) \wedge (q \rightarrow r) \Rightarrow p \rightarrow r$ | |

37.10 ARGUMENTS

(1) An argument is an assertion that a given set of propositions p_1, p_2, \dots, p_n (called premises) yields another proposition q (called conclusion). The argument is symbolically written as " $p_1, p_2, \dots, p_n \vdash q$ ".

An argument $p_1, p_2, \dots, p_n \vdash q$ is true provided q is true whenever all the premises p_1, p_2, \dots, p_n are true. An argument which is true is said to be 'valid argument'. Otherwise it is called a fallacy.

Example 37.14. Show that

- the argument $p \leftrightarrow q, q \vdash p$ is valid.
- the argument $p \rightarrow q, q \vdash p$ is a fallacy.

Solution. (a) Let us first prepare the truth table as follows :

p	q	$p \leftrightarrow q$
1	1	1
1	0	0
0	1	0
0	0	1

Since $p \leftrightarrow q$ is true in cases (rows) 1 and 4, and q is true in cases 1 and 3, therefore $p \leftrightarrow q$ and q both are true in case 1 only when p is also true. This shows that the given argument is valid.

(b) Let us first prepare the truth table below :

p	q	$p \rightarrow q$
1	1	1
1	0	0
0	1	1
0	0	1

This table shows that $p \rightarrow q$ and q both are true in case 3 only while the conclusion p is false. Hence the given argument is a fallacy.

(2) **Theorem.** The argument $p_1, p_2, \dots, p_n \vdash q$ is valid if and only if the proposition $(p_1 \wedge p_2 \wedge p_3 \wedge \dots \wedge p_n) \rightarrow q$ is a tautology.

The propositions p_1, p_2, \dots, p_n are simultaneously true if and only if the proposition $p_1 \wedge p_2 \wedge \dots \wedge p_n$ is true i.e., if the proposition $(p_1 \wedge p_2 \wedge \dots \wedge p_n) \rightarrow q$ is a tautology.

Obs. The validity of an argument depends upon the particular form of the argument, not on the truth values of the statement appearing in the argument.

Example 37.15. Test the validity of the following argument :

S_1 : If 5 is less than 3, then 6 is not a prime number

S_2 : 5 is not less than 6

S_3 : 5 is a prime number.

Solution. Let '5 is less than 3' be p and '5 is a prime number' be q . Then the given argument is of the form $p \rightarrow \neg q, \neg p \vdash q$.

Since in the last line of the truth table, the premises $p \rightarrow \neg q$ and $\neg p$ are true but the conclusion q is false, therefore the argument is fallacy.

p	q	$\neg q$	$p \rightarrow \neg q$	$\neg p$
1	1	0	0	0
1	0	1	1	0
0	1	0	1	1
0	0	1	1	1

PROBLEMS 37.2

- If p = Sam is a teacher, q = John is an honest boy, then translate the following into logical sentences :
 - $\neg(p \wedge q)$,
 - $p \vee \neg q$,
 - $\neg p \Leftrightarrow q$,
 - $p \Rightarrow \neg q$.
- Change the following sentence into symbols :
 - 'If I do not have car or I do not wear good dress then I am not a millionaire'.
 - Everyone who is healthy can do all kinds of work.(Anna, 2004 S)
- Prepare truth tables for the following statements (a) $(p \Rightarrow q) \wedge \neg q$, (b) $(p \Leftrightarrow q) \wedge (r \vee q)$.
- Write down the truth table of
 - $p \vee q$ (Madras, 1997)
 - $p \wedge (p \wedge q)$ (Madras, 2005 S)
- Verify that the following are tautologies :
 - $p \rightarrow [q \rightarrow (p \wedge q)]$
 - $(p \wedge q \Rightarrow r) \Leftrightarrow (p \Rightarrow r) \vee (q \Rightarrow r)$
 - $(p \Rightarrow q \wedge r) \Rightarrow (\neg r \Rightarrow \neg p)$(Anna, 2005)
- Show that $Q \vee (P \wedge \neg Q) \vee (\neg P \wedge \neg Q)$ is a tautology. (Anna, 2004 S ; Madras, 2003 S)
- Over the universe of positive integers
 - $p(n)$: n is prime and $n < 32$.
 - $q(n)$: n is a power of 3.
 - $r(n)$: n is a divisor of 27.
 - What are the truth sets of these propositions ?
 - Which of the three propositions implies one of the others ?
- Given the propositions over the natural numbers
 - p : $n < 4$, q : $2n > 17$ and r : n is a divisor of 18, what are the truth sets of
 - q ,
 - $p \wedge q$,
 - r ,
 - $q \rightarrow r$.(Madras, 1999)
- Show that (a) $\neg Q, P \rightarrow Q \Rightarrow \neg P$.
 - $(P \rightarrow R) \wedge (Q \rightarrow R) \Leftrightarrow (P \vee Q) \rightarrow R$. (Madras, 2003)
 - $(P \vee Q) \rightarrow R$. (Madras, 2001)
- Construct the truth table for (i) $(\neg p \rightarrow q) \wedge (q \neq p)$.
 - $\neg (P \vee (Q \wedge R)) \Leftrightarrow (P \vee Q) \wedge (P \vee R)$. (Bharthian, MSc. 2001)
 - $\neg (P \vee (Q \wedge R)) \Leftrightarrow (P \vee Q) \wedge (P \vee R)$. (Andhra, 2004)
- Prove that the following statement is a contradiction :

$$S = [(p \vee q) \wedge (p \vee \neg q) \wedge (\neg p \vee q) \wedge (\neg p \vee \neg q)].$$
- If p, q, r are three statements then prove that
 - $p \vee (q \wedge r) = (p \vee q) \wedge (p \vee r)$
 - $(p \Rightarrow q) \vee r = (p \vee r) \Rightarrow (q \vee r)$
 - $\neg (p \vee q) = \neg p \wedge \neg q$.
- Define conjunction, conditional, biconditional and negation, with examples.

14. Show that (i) $p \wedge q$ logically implies $p \leftrightarrow q$.
 (ii) $p \leftrightarrow \neg q$ does not logically imply $p \rightarrow q$. (U.P.T.U., 2001)
15. Write the duals of $(p \vee q) \wedge r$ and $(p \wedge q) \vee t$.
16. Show that $s \vee r$ is tautologically implied by $(p \vee q) \wedge (q \rightarrow r) \wedge (q \rightarrow s)$. (Andhra, 2004 ; Bharathian, 2001)
17. Let $P(n)$ be ‘ $8^n - 3^n$ is a multiple of 5’. Prove that $P(n)$ is a tautology on n . (Madras, 2003)
18. Prove that $P \rightarrow [Q, R \rightarrow Q, R \vdash] P$ is a valid argument. (Anna, 2005)
19. Prove that $p \rightarrow (q \vee r) \Leftrightarrow (p \wedge \neg q) \rightarrow r$.
20. Show that $R \vee S$ follows logically from the premises $C \vee D, C \vee D \rightarrow \neg H, H \rightarrow A \wedge \neg B, A \wedge \neg B \rightarrow R \vee S$.

37.11 PREDICATES

Statements involving variables such as ' $x > 7$ ' and ' $x = y + 7$ ' are neither true nor false so long as the values of the variable x, y are not specified. We now, discuss the ways that propositions can be evolved from such statements. The statement ' $x > 7$ ' has two parts : First part—'the variable x ' is the *subject* of the statement ; Second part—'is greater than 7' is the *predicate* which refers to the property that the subject of statement can have. If $P(x)$ denotes the statement ' $x > 7$ ' then P is the *predicate* and x is the *variable*. The statement $P(x)$ is also known as the value of the propositional function P at x . The *predicates* are denoted by capital letters and the *objects* by the variables (denoted by small letters in brackets).

Thus *predicates* are simple statements which turn out to be propositions involving variables whose values are not well specified.

In other words, *predicate* is a variable statement which becomes specific when particular values are assigned to the variables.

There are statements which involves more than one variable consider the statement ' $x = y + 7$ ' which is denoted by $Q(x, y)$ where Q is the predicate and x, y are the variables. When values are assigned to the variables x, y , the statement $Q(x, y)$ has the truth value.

Similarly $R(x, y, z)$ denotes the statement of the type ' $x + y = z$ '. When values are assigned to x, y, z , this statement has a truth value.

For example, consider the statements (i) Ram is fair ; (ii) Sham is fair.

Here in (i) and (ii) 'is fair' is the predicate while Ram and Sham are the objects. If we denote the predicate by F and the objects by r and s , then the above statements can be symbolically expressed as (i) $F(r)$; (ii) $F(s)$.

Now consider the statement Ram is fair and the house is pink.

Writing 'the house is pink' as $P(h)$, the given statement can be expressed as $F(r) \wedge P(h)$.

37.12 QUANTIFIERS

(1) In a propositional function, when all the variables are assigned values, the resulting statement has a truth value. However, there is another method to create a proposition from a propositional function which is called *quantification*. It is of two types : *Universal quantification* and *Existential quantification*.

(2) **Universal quantification.** Many statements assert that a property is true for all values of a variable in a certain domain. This domain is termed as the universe of discourse and such a statement is expressed using universal quantification.

Thus the universal quantification of $P(x)$ is the proposition ' $P(x)$ is true for all values of x in the universe of discourse'.

The universal quantification of $P(x)$ is denoted by $\forall x P(x)$. The symbol \forall is called the *universal quantifier*.

Obs. When it is possible to list all the elements in the universe of discourse say : x_1, x_2, \dots, x_n , then the universal quantification $\forall x P(x)$ is same as the conjunction $P(x_1) \wedge P(x_2) \wedge \dots, P(x_n)$ for this conjunction is true if and only if $P(x_1), P(x_2), \dots, P(x_n)$ are all true.

Example 37.16. What is the truth value of the quantification $\forall x P(x)$ where

(a) $P(x)$ is the statement ' $x < 5$ ' and universe of discourse is the set of real numbers.

(b) $P(x)$ is the statement ' $x^2 < 18$ ' and the universe of discourse consists of positive integers not exceeding 5?

Solution. (a) For instance, $P(6)$ is false ; therefore $P(x)$ is not true for all real numbers x .

Thus $\forall x P(x)$ is false.

Example 37.22. Symbolise the expression 'All the world loves a lover.'

(Madras, 2001)

Solution. Let $p(x) : x \text{ is a person};$
 $L(x) : x \text{ is a lover}.$

and

$Q(x, y) : x \text{ loves } y$

Then the required expression is

$$(\forall x) [p(x) \rightarrow (\forall y) (p(y) \wedge L(y)) \rightarrow Q(x, y)].$$

Summary. (i) $\forall Q(x)$ means that the predicate $Q(x)$ is true for all values in the universe of x .

(ii) $\exists Q(x)$ means that the predicate $Q(x)$ is satisfied if there is at least one value in the universe of x .

37.13 NORMAL FORMS

(1) For the given variables p_1, p_2, \dots, p_n , we may form a statement $S(p_1, p_2, \dots, p_n)$. The truth table for S will contain 2^n rows for all possible truth values of the n variables. The expression S may have the truth value 1 in all cases or may have the truth value 0 in all cases or have the truth value 1 for at least one combination of truth values assigned to the n variables. (Here S is said to be satisfiable). The problem of finding in a finite number of steps whether a given expression is a tautology or a contradiction or at least satisfiable is known as a *decision problem*. As the formation of a truth table is quite cumbersome, we go for an alternate approach called *normal form*.

In this approach, we use the word 'sum' in place of disjunction and 'product' in place of conjunction.

A sum of the variables and their negations is called an *elementary sum*. Similarly a product of the variables and their negation is called an *elementary product*.

(2) **Disjunctive normal form** of a given formula is the formula which is equivalent to the given formula and which contains the sum of the elementary products. The disjunctive normal form of a given form is not unique. In fact, several disjunctive normal forms can be obtained for a given formula by applying the distributive laws in different ways.

A given formula is however, identically false if every elementary product appearing in its disjunctive normal form is identically false.

Example 37.23. Obtain the disjunctive normal forms of

$$(i) p \wedge (p \rightarrow q) \quad (ii) \neg(p \vee q) \leftrightarrow (p \wedge q).$$

Solution. (i) $p \wedge (p \rightarrow q) \Leftrightarrow p \wedge (\neg p \vee q) \Leftrightarrow (p \wedge \neg p) \vee (p \wedge q)$.

which is the desired disjunctive normal form.

$$\begin{aligned} (ii) \neg(p \vee q) &\Leftrightarrow (p \wedge q) \Leftrightarrow \neg(p \vee q) \wedge (p \wedge q) \vee (p \vee q) \wedge \neg(p \wedge q) \quad [\because E \leftrightarrow F \Leftrightarrow (E \wedge F) \vee (\neg E \wedge \neg F)] \\ &\Leftrightarrow (\neg p \wedge \neg q \wedge p \wedge q) \vee [(p \vee q) \wedge (\neg p \vee \neg q)] \\ &\Leftrightarrow (\neg p \wedge \neg q \wedge p \wedge q) \vee [(p \vee q) \wedge \neg p] \vee [(p \vee q) \wedge \neg q] \\ &\Leftrightarrow (\neg p \wedge \neg q \wedge p \wedge q) \vee (p \wedge \neg p) \vee (q \wedge \neg p) \vee (p \wedge \neg q) \vee (q \wedge \neg q) \end{aligned}$$

which is the desired disjunctive normal form.

(3) **Conjunctive normal form** of a given formula is that formula which is equivalent to the given formula and contains the product of elementary sums.

Example 37.24. Find a conjunctive normal form of $\neg(p \vee q) \leftrightarrow (p \wedge q)$.

$$\begin{aligned} \text{Solution. } \neg(p \vee q) &\leftrightarrow (p \wedge q) \Leftrightarrow [\neg(p \vee q) \rightarrow (p \wedge q)] \wedge [p \wedge q \rightarrow \neg(p \vee q)] \\ &\Leftrightarrow [(p \vee q) \vee (p \wedge q)] \wedge [\neg(p \wedge q) \vee \neg(p \vee q)] \quad [\text{By conditional equivalence}] \\ &\Leftrightarrow (p \vee q \vee p) \wedge (p \vee q \vee q) \wedge [\neg(p \vee \neg q) \vee (\neg p \wedge q)] \\ &\Leftrightarrow p \vee q \vee p \wedge (p \vee q \vee q) \wedge (\neg p \vee \neg q \vee \neg p) \wedge (\neg p \vee q \vee \neg q) \end{aligned}$$

which is the required conjunctive normal form.

(4) **Principal disjunctive normal form.** Consider a formula for the propositions p and q using conjunction as $p \wedge q$, $p \wedge \neg q$, $\neg p \wedge q$, $\neg p \wedge \neg q$. These terms are called *minterms* or *Boolean conjunction* of p and q .

An equivalent formula for a given formula, consisting of disjunctions of minterms only is called the **principal disjunctive normal form (pdnf)** or **sum of products canonical form**.

Procedure to obtain the principle disjunctive normal form : (i) Replace the conditions and biconditions by their equivalent formulae containing \wedge , \vee , \neg only.

(ii) Using DeMorgan's laws, apply negations to the variables.

(iii) Apply the distribution laws.

(iv) Introduce the missing factors to obtain minterms in the disjunctions.

(v) Delete identical minterms appearing in the disjunctions.

Example 37.25. Obtain the pdnf for

$$(i) p \vee q$$

$$(ii) \neg(p \wedge q)$$

$$(iii) \neg p \vee q \quad i.e., p \rightarrow q.$$

$$\text{Solution. } (i) p \vee q \Leftrightarrow [p \wedge (q \vee \neg q)] \vee [q \wedge (p \vee \neg p)]$$

$$\Leftrightarrow (p \wedge q) \vee (p \wedge \neg q) \vee (q \wedge p) \vee (q \wedge \neg p)$$

$$\Leftrightarrow (p \wedge q) \vee (p \wedge \neg q) \vee (q \wedge \neg p)$$

$$(ii)$$

$$\neg(p \wedge q) \Leftrightarrow (\neg p \vee \neg q) \Leftrightarrow [\neg p \wedge (\neg q \vee q)] \vee [\neg q \wedge (p \vee \neg p)]$$

$$\Leftrightarrow (\neg p \wedge \neg q) \vee (\neg p \wedge q) \vee (\neg q \wedge p) \vee (\neg q \wedge \neg p)$$

$$\Leftrightarrow (\neg p \wedge \neg q) \vee (\neg p \wedge q) \vee (\neg q \wedge p)$$

$$(iii)$$

$$\neg p \vee q \Leftrightarrow \neg p \wedge (q \vee \neg q) \vee [q \wedge (p \vee \neg p)]$$

$$\Leftrightarrow (\neg p \wedge q) \vee (\neg p \wedge \neg q) \vee (q \wedge p) \vee (q \wedge \neg p)$$

$$\Leftrightarrow (\neg p \wedge q) \vee (\neg p \wedge \neg q) \vee (q \wedge p).$$

(5) Principal conjunctive normal form. Consider a formula for the propositions p and q using disjunction as $p \vee q$, $\neg p \vee q$, $p \vee \neg q$, $\neg p \vee \neg q$. These terms are called *max terms*.

An equivalent formula for a given formula, consisting of conjunctions of the max terms only is called the **principal conjunctive normal form (pcnf)** or **product of sum canonical form**.

Procedure for obtaining pcnf for a given formula is similar to the one for pdnf as all assertions made for pdnf can be made for pcnf using duality principle.

Example 37.26. Obtain the principal disjunctive and conjunctive normal forms of

$$p \rightarrow [(p \rightarrow q) \wedge \neg(\neg q \vee \neg p)].$$

(Bharathiar, 2001)

$$\text{Solution. } (i) p \rightarrow [(p \rightarrow q) \wedge \neg(\neg q \vee \neg p)]$$

$$\Leftrightarrow \neg p \wedge [(\neg p \vee q) \wedge (q \wedge p)]$$

[Using DeMorgan's law and equivalence $p \rightarrow q \Leftrightarrow \neg p \vee q$.]

$$\Leftrightarrow \neg p \vee [\neg p \wedge (q \wedge p)] \vee [q \wedge (q \wedge p)]$$

$$\Leftrightarrow \neg p \vee (q \wedge p)$$

$$\Leftrightarrow [\neg p \wedge (q \vee \neg q)] \vee (q \wedge p)$$

$$\Leftrightarrow (\neg p \wedge q) \vee (\neg p \wedge \neg q) \vee (q \wedge p)$$

This is the desired pdnf.

$$(ii) \quad p \rightarrow [(p \rightarrow q) \wedge \neg(\neg q \vee \neg p)]$$

$$\Leftrightarrow \neg p \vee [(\neg p \vee q) \wedge (q \wedge p)]$$

$$\Leftrightarrow [\neg p \vee (\neg p \vee q)] \wedge [\neg p \vee (q \wedge p)]$$

$$\Leftrightarrow (\neg p \vee q) \wedge (\neg p \vee q) \wedge (\neg p \vee p)$$

$$\Leftrightarrow \neg p \vee q$$

This is the desired pcnf.

Example 37.27. Obtain the principal conjunctive normal form for $(Q \rightarrow P) \wedge (\neg P \wedge Q)$. (Andhra, 2004)

$$\text{Solution. } (Q \rightarrow P) \wedge (\neg P \wedge Q) \Leftrightarrow (\neg Q \vee P) \wedge (\neg P \wedge Q)$$

$$\Leftrightarrow (\neg Q \vee P) \wedge [\neg P \vee (Q \wedge \neg Q) \wedge Q \vee (P \wedge \neg P)]$$

$$\Leftrightarrow (\neg Q \vee P) \wedge (\neg P \vee Q) \wedge (\neg P \vee \neg Q) \wedge (Q \vee P) \wedge (Q \vee \neg P)$$

$$\Leftrightarrow (\neg Q \vee P) \wedge (\neg P \vee Q) \wedge (\neg P \vee \neg Q) \wedge (Q \vee P).$$

37.14 INFERENCE THEORY

Inferring the conclusions from certain premises is known as the *inference theory*. When conclusion is reached from a set of premises by using the accepted rules of reasoning, then this process is called a *deduction* or a *formal proof*. A proof of a theorem is a valid argument.

The criteria for finding 'whether an argument is valid' are called *rules* which are expressed in terms of premises and conclusions or in terms of statement formulae.

The proofs are of two types : Direct or Indirect.

(i) If in a proof the truth of the premises directly shows the truth of the conclusions, then it is called a *direct proof*.

(ii) An *indirect proof* proceeds by assuming that p is true and also C is false, and then deduce a contradiction using p and $\neg C$, along with other premises.

The only difference between assumptions in a direct proof or an indirect proof is the negated conclusion.

Rules for deriving direct and indirect proofs :

(i) the proof should have finite steps only ;

(ii) each step must be either a premise or a proposition which is implied from previous steps using valid equivalence or implication ;

(iii) the last step for a direct proof must be conclusion while for an indirect proof it must be a contradiction.

Example 37.28. State whether the conclusion C follows logically from the premises R and S .

$$(a) \quad R : p \rightarrow q, \quad S : p, \quad C : \neg q$$

$$(b) \quad R : p, \quad S : p \leftrightarrow q, \quad C : \neg(p \wedge q)$$

$$(c) \quad R : p \rightarrow q, \quad S : p, \quad C : q$$

Solution. Let us first form the following truth table :

p	q	$\neg p$	$\neg q$	$p \rightarrow q$	$\neg(p \wedge q)$	$p \leftrightarrow q$
1	1	0	0	1	0	1
1	0	0	1	0	1	0
0	1	1	0	1	0	0
0	0	1	1	1	1	1

(a) Here only the first row of premises R and S contains 1 but not the conclusion C .

Hence C is not valid.

(b) Only the first row of both R and S contains 1 but not the conclusion C .

Hence C is not valid.

(c) Here both R and S contain '1' only in the first row and the conclusion C also has '1' in that row. Hence our conclusion is valid.

Example 37.29. Find the direct and indirect proofs of $p \rightarrow (q \rightarrow r), \neg r \vee p, q \Rightarrow r \rightarrow s$.

Solution. *Direct proof*

$$(i) \neg r \vee p \quad (\text{premise}) \qquad (ii) r \quad (\text{another premise})$$

$$(iii) p \quad [\text{By (i) and (ii)}] \qquad (iv) p \rightarrow (q \rightarrow r) \quad (\text{premise})$$

$$(v) q \rightarrow r \quad [\text{By (iii) and (iv)}] \qquad (vi) q \quad (\text{premise})$$

$$(vii) r \quad [\text{By (v) and (vi)}], \text{ which is a conclusion.}$$

Indirect proof

$$(i) \neg(s \rightarrow r) \quad (\text{negative of conclusion})$$

$$(ii) s \wedge \neg r \quad (\text{By conditional equivalence})$$

$$(iii) \neg r \vee p \quad (\text{premise})$$

$$(iv) \neg r \quad \text{and} \quad (v) s \quad [\text{By conjunctive simplification}]$$

$$(vi) p \quad [\text{By disjunction of (iii) and (iv)}]$$

$$(vii) p \rightarrow (q \rightarrow r) \quad (\text{premise})$$

- (viii) $q \rightarrow r$ [By (vi) and (vii)]
 (ix) q (premise)
 (x) r [By (viii) and (ix)]
 (xi) $r \wedge \neg r$ [By (x) and (iv)]

This is a contradiction.

PROBLEMS 37.3

- If $A = \{1, 2, 3, 4, 5\}$ be the universal set, determine the truth values of each of the following statements :
 (a) $(\forall x \in A) (x + 2 < 10)$ (b) $\exists x \in A (x + 2 = 10)$
- Negate each of the following statements :
 (a) $\forall x, x^2 = x$; (b) $\forall x, x + 5 > x$
 (c) Some students are 26 or older. (d) All students live in the hostels.
- What is the truth value of $\forall x P(x)$ where $P(x)$ is a statement ' $x^2 < 10$ ' and the universe of discourse consists of positive integers not exceeding 4.
- Use universal quantifier to state 'the sum of any two rational numbers is rational'.
- Over the universe of real numbers, use quantifier to say that the equation $a + x = b$ has a solution for all values of a and b .
- Translate the following statements involving quantifiers, into formulae :
 (a) All rationals are reals. (b) No rationals are reals.
 (c) Some rationals are reals. (d) Some rationals are not reals.
- Show that $Q \vee (P \wedge \neg Q) \vee (\neg P \wedge \neg Q)$ is a tautology.
- Convert $\neg A \wedge (\neg B \rightarrow C) \Rightarrow 0$ into CNF. (V.T.U., MCA, 2001)
- Without constructing truth tables, obtain the product of sums canonical form of the formula $(\neg P \rightarrow R) \wedge (Q \leftrightarrow P)$. Hence find the sum of products canonical form. (Anna, 2004 S)
- Find the direct proof of $p \rightarrow r, q \rightarrow s, p \vee q \Rightarrow s \vee r$.
- Prove that $P \rightarrow Q, Q \rightarrow R, P \vee R \Rightarrow R$ by using indirect method. (Anna, 2004 S)
- Using quantifier say $\forall z$ is not a real number ?
- State whether the conclusion C follows logically from the premises R and S
 (a) $R : p \rightarrow q, S : \neg q, C : q$ (b) $R : p \rightarrow q, S : q, C : \neg p$.

III. BOOLEAN ALGEBRA

37.15 INTRODUCTION

(1) The concept of Boolean algebra was first introduced by George Boole* in 1854 through his paper 'An investigation of the laws of thought'. It is basically two values i.e., $(0, 1)$ set. Earlier it had applications to statements and sets which are either true or false. In 1938 Claude Shannon showed that basic rules given by Boole could be used to design circuits. These days however, Boolean algebra has wide applications to switching circuits, electrical networks and electronic computers.

Basically there are three operations in the Boolean algebra (i) AND, (ii) OR, and (iii) NOT, which are symbolically represented by \wedge , \vee and \neg respectively. Some authors, use the symbols $(+)$, $(.)$ and $(/)$ for the same operations.

Here ' \neg ' denotes the complement of an element and is defined by $0' = 1$ and $1' = 0$.

The operator \wedge (i.e., 'AND') has the following values $1 \wedge 1 = 1, 1 \wedge 0 = 0, 0 \wedge 1 = 0, 0 \wedge 0 = 0$; while the operator \vee (i.e., 'OR') has the values $1 \vee 1 = 1, 1 \vee 0 = 1, 0 \vee 1 = 1, 0 \vee 0 = 0$.

Def. Any non-empty set B with the binary operations ' \wedge ' and ' \vee ' and the unary operation ' \neg ' is called the Boolean algebra $[B, \wedge, \vee, \neg]$ if the following axioms hold where a, b, c are elements in B :

- Commutative law : $a \wedge b = b \wedge a ; a \vee b = b \vee a$
- Associative law : $a \wedge (b \wedge c) = (a \wedge b) \wedge c$
 $a \vee (b \vee c) = (a \vee b) \vee c$

*A British mathematician George Boole (1813–1864) who created Boolean algebra.

3. Distributive law : $a \vee (b \wedge c) = (a \vee b) \wedge (a \vee c)$

$$a \wedge b \vee c = (a \wedge b) \vee (a \wedge c)$$

4. Complement law : $a \wedge a' = 0, a \vee a' = 1$

The operations \wedge, \vee and $/$ are called sum, product, and complement respectively. We shall follow the usual practice that $/$ has precedence over \vee , and \vee has precedence over \wedge , unless guided by brackets. e.g., $a \wedge b \vee c$ means $a \wedge (b \vee c)$ not $(a \wedge b) \vee c$ while $a \vee b'$ implies $a \vee b'$ not $(a \vee b)'$.

(2) Boolean function. The variable x is called a *Boolean variable* if it assumes values only from $B \{0, 1\}$.

Def. A function from the set $\{(x_1, x_2, \dots, x_n) : x_i \in B, 1 \leq i \leq n\}$ is called a *Boolean function of degree n*. Boolean functions can be represented by expressions comprised of variables and Boolean operations.

e.g., $0, 1, x_1, x_2, \dots, x_n$ are Boolean expressions in the variables $x_i (1 \leq i \leq n)$. If p and q are Boolean expressions then $p \wedge q, p \vee q$ and p' are also Boolean expressions and each represents a Boolean function.

By substituting 0 and 1 for the variables in the expression, the values of this function can be found.

(3) If f and g be Boolean functions of degree n, then

(i) Complement of f is the function f' where

$$f'(x_1, x_2, \dots, x_n) = [f(x_1, x_2, \dots, x_n)]'$$

(ii) f and g are equal if $f(x_1, x_2, \dots, x_n) = g(x_1, x_2, \dots, x_n)$

(iii) Boolean sum $f \vee g$ is

$$(f \vee g)(x_1, x_2, \dots, x_n) = f(x_1, x_2, \dots, x_n) \vee g(x_1, x_2, \dots, x_n)$$

(iv) Boolean product $f \wedge g$ is

$$(f \wedge g)(x_1, x_2, \dots, x_n) = f(x_1, x_2, \dots, x_n) \wedge g(x_1, x_2, \dots, x_n).$$

(4) Power in a Boolean function : $x^2 = x \vee x = x$

$$x^3 = x^2 \vee x = x \vee x = x, \dots, x^n = x$$

Similarly, $2x = x, 3x = x$ etc.

Example 37.30. Find the values of the Boolean function $f = (x \wedge y') \vee z'$.

Solution. f being third degree Boolean function has 2^3 i.e. 8 values which are shown in the following table :

x	y	z	y'	z'	$x \wedge y'$	$(x \wedge y') \vee z'$
1	1	1	0	0	0	0
1	1	0	0	1	0	1
0	1	1	0	0	0	0
1	0	1	1	0	1	1
0	0	1	1	0	0	0
1	0	0	1	1	1	1
0	1	0	0	1	0	1
0	0	0	1	1	0	1

37.16 DUALITY

(1) The dual of any Boolean function is obtained by interchanging Boolean sums and Boolean products along with the interchange of zeros and ones.

For example the dual of $x \vee (y \wedge 0)$ is $x \wedge (y \vee 1)$.

The dual of any theorem of a Boolean algebra is also its theorem. This implies that the dual of any theorem in Boolean algebra is always true.

(2) Principle of duality. The dual of any theorem (or property) in Boolean algebra is also a theorem (or property).

37.17 BOOLEAN IDENTITIES

There are many identities in Boolean algebra which are quite useful in simplifying electrical circuits. Some of the important ones are given below :

1. Identity law :	$x \vee 0 = x ; x \wedge 1 = x$
2. Dominance laws :	$x \vee 1 = 1 ; x \wedge 0 = 0$
3. Complement law :	$x \vee x' = 1 ; x \wedge x' = 0$
4. Idempotent law :	$x \vee x = x ; x \wedge x = x$
5. Double complement law :	$(x')' = x$
6. Commutative law :	$x \vee y = y \vee x ; x \wedge y = y \wedge x$
7. Associative law :	$x \vee (y \vee z) = (x \vee y) \vee z$ $x \wedge (y \wedge z) = (x \wedge y) \wedge z$
8. Distributive law :	$x \vee (y \wedge z) = (x \vee y) \wedge (x \vee z)$ $x \wedge (y \vee z) = (x \wedge y) \vee (x \wedge z)$
9. De-Morgan's law :	$x \wedge y = x' \vee y' ; (x \vee y)' = x' \wedge y'$
10. Absorption law :	$x \wedge (x \vee y) = x$

(Bhopal, 2008)

Example 37.31. Let B be a Boolean algebra. Show that for all $a \in B$, there exists a unique complement a' .

(Andhra, 2004)

Solution. Let b and c be two complements of a .

$$\begin{aligned} \text{Then } b &= b \wedge 1 && [\because 0 \text{ is an additive identity}] \\ &= b \wedge (a \vee c) && [\because c \text{ is complement of } a] \\ &= (b \wedge a) \vee (b \wedge c) = (a \wedge b) \vee (b \wedge c) \\ &= 0 \vee (b \wedge c) && [\because a \wedge b = a \wedge a' = 0] \\ &= b \wedge c && \dots(i) \end{aligned}$$

$$\begin{aligned} \text{Similarly } c &= c \wedge 1 = c \wedge (a \vee b) && [\because a \vee b = a \vee a' = 1] \\ &= (c \wedge a) \vee (c \wedge b) \\ &= (a \wedge c) \vee (b \wedge c) \\ &= 0 \vee (b \wedge c) && [\because a \wedge c = a \wedge a' = 0] \\ &= b \wedge c && \dots(ii) \end{aligned}$$

From (i) and (ii), we find that $b = c$.

Thus the complement of a is unique.

Example 37.32. In a Boolean algebra, show that

$$(i) x + (x \cdot y) = x \quad (ii) x \cdot (x + y) = x. \quad (\text{Bhopal, 2008})$$

$$\begin{aligned} \text{Solution. (i)} \quad x + (x \cdot y) &= x \wedge (x \vee y) = (x \vee 0) \wedge (x \vee y) && [\because x \vee 0 = x] \\ &= x \vee (0 \wedge y) && [\text{By distributive law}] \\ &= x \vee (y \wedge 0) && [\text{By commutative law}] \\ &= x \vee 0 && [\because y \wedge 0 = 0] \\ &= x. \end{aligned}$$

$$\begin{aligned} \text{(ii)} \quad x \cdot (x + y) &= x \vee (x \wedge y) && [\because x \wedge 1 = x] \\ &= (x \wedge 1) \vee (x \wedge y) && [\text{By distributive law}] \\ &= x \wedge (1 \vee y) && [\text{By commutative law}] \\ &= x \wedge (y \vee 1) && [\because 1 \vee y = 1] \\ &= x \wedge 1 \\ &= x. \end{aligned}$$

Example 37.33. Simplify the following :

$$(i) (x + y) \cdot x' \cdot y' \quad (ii) x \vee y \wedge y \vee z \wedge y \vee z' \quad (iii) x \vee y \wedge [(x \wedge y') \vee y].$$

Solution. (i)	$\begin{aligned} (x \wedge y) \vee x' \vee y' &= (x \wedge y) \vee (x' \vee y') \\ &= (x \wedge y) \vee (x \wedge y)' \\ &= 1. \end{aligned}$	[By De Morgan's law] [$\because p \vee p' = 1$]
(ii)	$\begin{aligned} x \vee y \wedge y \vee z \wedge y \vee z' &= (y \vee x) \wedge (y \vee z) \wedge (y \vee z') \\ &= [y \vee (x \wedge z)] \wedge (y \vee z') \\ &= y \vee [x \wedge (z \wedge z')] \\ &= y \vee [x \wedge (z \wedge 0)] \\ &= y \vee (x \wedge 0) \\ &= y \vee 0 \\ &= y. \end{aligned}$	[By commutative law] [By distributive law] [$\because z \wedge z' = 0$] [$\because x \wedge 0 = 0$]
(iii)	$\begin{aligned} x \vee y \wedge [(x \wedge y') \vee y]' &= x \vee y \wedge [y \vee (x \wedge y')]' \\ &= x \vee y \wedge [(y \vee x) \wedge (y \vee y')]' \\ &= (x \vee y) \wedge [(x \vee y) \wedge 1]' \\ &= (x \vee y) \wedge (x \vee y)' = 0. \end{aligned}$	[By commutative law] [By distributive law] [$\because y \vee y' = 1$]

Example 37.34. Show that

$$(i) x \vee y \wedge y \vee z \wedge z \vee x = (x \wedge y) \vee (y \wedge z) \vee (z \wedge x)$$

$$(ii) (x \wedge y) \vee (x' \wedge z) = (x' \vee y) \wedge (x \vee z).$$

(Bhopal, 2008)

Solution. (i) R.H.S.	$\begin{aligned} &= (x \wedge y) \vee (y \wedge z) \vee (z \wedge x) \\ &= (x \wedge y) \vee (z \wedge y) \vee (z \wedge x) \\ &= (x \wedge y) \vee (z \wedge y \vee x) \\ &= (x \vee z) \wedge (y \vee z) \wedge [x \vee (y \vee x)] \wedge [y \vee (y \wedge x)] \\ &= (x \vee z) \wedge (y \vee z) \wedge [(x \vee y) \wedge (y \vee x)] \\ &= (x \vee z) \wedge (y \vee z) \wedge [(x \vee y) \wedge (x \vee y)] \\ &= (x \vee z) \wedge (y \vee z) \wedge (x \vee y) \\ &= (x \vee y) \wedge (y \vee z) \wedge (z \vee x) \\ &= \text{L.H.S.} \end{aligned}$	[By commutative law] [By distributive law] [$\because x \vee x = x$ etc.]
(ii) L.H.S.	$\begin{aligned} &= (x \wedge y) \vee (x' \wedge z) \\ &= [x \vee (x' \wedge z)] \wedge [y \vee (x' \wedge z)] \\ &= [(x \vee x') \vee (x \vee z)] \wedge [(y \vee x') \wedge (y \vee z)] \\ &= [1 \vee (x \vee z)] \wedge [(y \vee x') \wedge (y \vee z)] \\ &= (x \vee z) \wedge (y \vee x') \wedge (y \vee z) \vee 1 \\ &= (x \vee z) \wedge (y \vee x') \wedge [(y \vee z) \vee (x \wedge x')] \\ &= (x \vee z) \wedge (y \vee x') \wedge [(y \vee z) \vee x] \vee (y \vee z) \vee x' \\ &= (x \vee z) \wedge [y \vee z \vee x] \wedge (x' \vee y) \vee [x' \wedge (y \vee z)] \\ &= (x \vee z) \vee (1 \wedge y) \wedge (x' \vee y) \vee (1 \wedge z) \\ &= [(x \vee z) \wedge 1] \wedge [(x' \vee y) \wedge 1] \\ &= (x \vee z) \wedge (x' \vee y) = \text{R.H.S.} \end{aligned}$	[By distributive law] (By commutative law)

Example 37.35. Show that

$$(i) x \vee y \wedge x' \vee y' = (x' \wedge y) \vee (x \wedge y')$$

$$(ii) [x \wedge (x' \vee y)] \vee [x' \wedge (x \vee y)] = y.$$

Solution. (i)	$\begin{aligned} (x \vee y) \wedge (x' \vee y') &= [(x \vee y) \wedge x'] \vee [(x \vee y) \wedge y'] \\ &= [(x \wedge x') \vee (y \wedge x')] \vee [(x \wedge y') \vee (y \wedge y')] \\ &= [0 \vee (x' \wedge y)] \vee [(x \wedge y') \wedge 0] \\ &= (x' \wedge y) \vee (x \wedge y'). \end{aligned}$	[By distributive law] [$\because x \wedge x' = 0$]
(ii)	$\begin{aligned} [x \wedge (x' \vee y)] \vee [x' \wedge (x \vee y)] &= [(x \wedge x') \vee (x \wedge y)] \vee [(x' \wedge x) \vee (x' \wedge y)] \\ &= [0 \vee (x \wedge y)] \vee [0 \vee (x' \wedge y)] \\ &= (x \wedge y) \vee y \wedge 1 = y. \end{aligned}$	[$\because x \wedge x' = 0$]

Example 37.36. If $a \vee x = b \vee x$ and $a \vee x' = b \vee x'$, then prove that $a = b$.

Solution. Since $a \vee x = b \vee x$ and $a \vee x' = b \vee x'$

$$\therefore (a \vee x) \wedge (a \vee x') = (b \vee x) \wedge (b \vee x')$$

i.e.,

or

or

$$a \vee (x \wedge x') = b \vee (x \wedge x')$$

$$a \vee 0 = b \vee 0$$

$$a = b.$$

[By distributive law]

$$[\because x \wedge x' = 0]$$

Example 37.37. In Boolean algebra $\{B, +, ., /\}$, show that

$$(x \cdot y' + y \cdot z) \cdot (x \cdot z + y \cdot z') = x \cdot z$$

(Bhopal, 2008; M.P.T.U., 2001)

Solution. $(x \vee y') \wedge (y \vee z) \vee [(x \vee z) \wedge (y \vee z')] =$

$$\begin{aligned} &= [(x \vee y') \wedge y] \vee [(x \vee y') \wedge z] \vee [(x \vee z) \wedge y] \vee [(x \vee z) \wedge z'] \\ &= [(x \wedge y) \vee (y' \wedge y)] \vee [(x \wedge z) \vee (y' \wedge z)] \vee [(x \wedge y) \vee (z \wedge y)] \vee [(x \wedge z) \vee (z \wedge z')] \\ &= [(x \wedge y) \vee 0] \vee [(x \wedge z) \vee (y' \wedge z)] \vee [(x \wedge y) \vee (z \wedge y)] \vee [(x \wedge z) \vee 0] \\ &= [(x \wedge y) \vee (x \wedge y)] \vee [(x \wedge z) \vee (x \wedge z')] \vee [(z \wedge y) \vee (z \wedge y')] \\ &= (x \wedge y) \vee (x \wedge 1) \vee (z \wedge 1) = (x \wedge y) \vee x \vee z \\ &= (x \vee x \vee z) \wedge (y \vee x \vee z) = (x \vee z) \wedge (y \vee x \vee z) \\ &= (x \vee z) \wedge (1 \vee y) = (x \vee z) \wedge 1 \\ &= x \vee z. \end{aligned}$$

PROBLEMS 37.4

1. Find the truth table for the Boolean function $f(x, y, z) = (x \wedge y) \vee (y \wedge z')$.

(Andhra, 2004)

2. Write the dual of the Boolean expression $x + x' \cdot y = x + y$.

3. Simplify the following :

$$(i) (x \wedge y \wedge z)^*$$

$$(ii) (x \vee y \vee z) \wedge (x' \wedge y' \wedge z').$$

4. In a Boolean algebra $\{B, \wedge, \vee, /\}$, prove that

$$(i) (x \wedge y) \vee (x \wedge y') = x.$$

$$(ii) x' \wedge (x \wedge y) = x' \wedge y.$$

5. If $a \wedge x = b \wedge x$ and $a \wedge x' = b \wedge x'$, then show that $a = b$.

6. In a Boolean algebra $\{B, \wedge, \vee, /\}$, show that

$$(i) x \wedge (x \wedge y) = x \wedge y$$

$$(ii) x \vee (x \vee y) = x \vee y.$$

7. In Boolean algebra, prove that

$$(i) x \wedge (x' \vee y) = x \wedge y$$

$$(ii) x' \wedge y = x' \wedge (x \vee y).$$

8. Show that $(x \wedge y') \vee (x' \wedge y) \vee (x' \wedge y') = x' \vee y'$.

9. If B be a Boolean algebra and $x, y, z \in B$, prove that

$$(x \vee y) \wedge (x \vee y') \wedge (x' \vee y) = x \wedge y$$

10. Prove that $(x \vee y) \wedge [z \vee (x' \wedge y')] = (x \vee y) \wedge z$.

(Bhopal, 2009)

11. In a Boolean algebra B , prove that $(a + b)' = a' \cdot b' \vee a, b \in B$.

(Madras, 2001)

12. In any Boolean algebra, show that $a = b$ if and only if $a \cdot b' + a' \cdot b = 0$.

13. In Boolean algebra, show that

$$(i) (a + b) \cdot (a' + c) = a \cdot c + a' \cdot b + b \cdot c.$$

$$(ii) (a + b') \cdot (b + c') \cdot (c + a') = (a' + b) \cdot (b' + c) \cdot (c' + a).$$

(Andhra, 2004)

14. Give the truth table for the Boolean function

$f: B_3 \rightarrow B$ determined by the polynomial

$$P(x_1, x_2, x_3) = (x_1 \vee x_2) \wedge (x_1 \wedge (x_2 \vee x_3)).$$

(V.T.U., 2001)

37.18 MINIMAL BOOLEAN FUNCTION

Def. A minimal Boolean function in n variables is the product of x_1, x_2, \dots, x_n . It is also called minterm.

If x, y are two variables and x', y' are their complementary variables respectively, then $x \vee y, x' \vee y, x' \wedge y, x \wedge y'$, $x' \wedge y'$ are each a minimal Boolean function.

Similarly there are 2^3 i.e. 8 minimal Boolean functions in the three variables x, y, z i.e., $x \vee y \vee z, x' \vee y \vee z, x \vee y' \vee z, x \vee y \vee z', x \vee y' \vee z, x' \vee y \vee z', x' \vee y' \vee z, x' \vee y' \vee z'$.

In general, there are 2^n minimal Boolean functions (or minterms) in n variables.

Similarly the join of the variables x_1, x_2, \dots, x_n is called a **maxterm** and there will be 2^n maxterms.

37.19 DISJUNCTIVE NORMAL FORM

(1) **Def.** A Boolean function which can be expressed as sum of minimal Boolean functions is called a **Disjunctive normal form** or **minterm normal form** or **Canonical form**.

(2) If the number of distinct terms in a disjunctive normal form of Boolean function in n variables are 2^n , then it is called a **complete disjunctive normal form**.

(3) **Complement function of a disjunctive normal form** function f is the sum of all those terms of a complete disjunctive normal form which are not present in the disjunctive normal form of f . The complement of f is denoted by f' .

For example, if $f = (x \vee y) \wedge (x \vee y')$

then its complete disjunctive normal form in variables x and y is

$$(x \vee y) \wedge (x' \vee y) \wedge (x \wedge y') \wedge (x' \wedge y')$$

\therefore The complement function of this disjunctive normal form is $f'(x, y) = (x' \wedge y) \wedge (x' \wedge y')$.

Example 37.38. Find the value of the complete disjunctive normal form in three variables x, y, z .

Solution. The complete disjunctive normal form in three variables x, y, z is

$$\begin{aligned} f(x, y, z) &= (x \vee y \vee z) \wedge (x \vee y \vee z') \wedge (x \vee y' \vee z) \wedge (x \vee y' \vee z') \\ &\quad \wedge (x \vee y' \vee z') \wedge (x' \vee y \vee z') \wedge (x' \vee y' \vee z) \wedge (x' \vee y' \vee z') \\ &= [(x \vee y) \vee (z \wedge z')] \wedge [(x \wedge y') \vee (z \wedge z')] \wedge [(x' \wedge y) \vee (z \wedge z')] \wedge [(x' \wedge y') \vee (z \wedge z')] \\ &= [(x \vee y) \vee 0] \wedge [(x \wedge y') \vee 0] \wedge [(x' \wedge y) \vee 0] \wedge [(x' \wedge y') \vee 0] \\ &= [x \vee (y \wedge y')] \wedge [x' \vee (y \wedge y')] \\ &= (x \vee 0) \wedge (x' \vee 0) = x \wedge x' = 0. \end{aligned}$$

37.20 CONJUNCTIVE NORMAL FORM

Def. If a Boolean function $f(x_1, x_2, \dots, x_n)$ is expressed in the form of factors and each factor is the sum of all the n -variables, then such a function is called a **conjunctive normal form** or **maxterm normal form** or **dual canonical form**.

(2) If a conjunctive normal of a function of n variables contains all the 2^n distinct factors, then such a function is called a **complete conjunctive normal form**.

(3) **Complement function of a conjunctive normal form** function f is a Boolean function which is the product of all those terms of complete conjunctive normal form which are not present in conjunctive normal form of f .

The complement of conjunctive normal form f is denoted by f' .

For example, if $f(x, y) = (x \wedge y) \vee (x \wedge y')$

then its complete conjunctive normal form in x and y is

$$(x \wedge y) \vee (x \wedge y') \vee (x' \wedge y) \vee (x' \wedge y')$$

\therefore The complement function of this conjunctive normal form is

$$f'(x, y) = (x' \wedge y) \vee (x' \wedge y')$$

Example 37.39. Given Boolean expression f , where $f(x_1, x_2, x_3) = (x_3' \wedge x_2) \vee (x_1' \wedge x_3) \vee (x_2 \wedge x_3)$, simplify this expression stating the laws used and obtain the minterm normal form. (Bharathiar, 1997)

Solution. Given $f(x_1, x_2, x_3) = (x_3' \wedge x_2) \vee (x_1' \wedge x_3) \vee (x_2 \wedge x_3)$

$$= (x_3' \wedge x_2) \vee (x_2 \wedge x_3) \vee (x_1' \wedge x_3)$$

[By commutative law]

$$= (x_2 \wedge x_3') \vee (x_2 \wedge x_3) \vee (x_1' \wedge x_3)$$

$$= [x_2 \wedge (x_3' \vee x_3)] \vee (x_1' \wedge x_3)$$

[By distributive law]

$$= (x_2 \wedge 1) \vee (x_1' \wedge x_3)$$

$$= x_2 \vee x_1' \wedge x_3$$

[$\therefore p \vee p' = 1$]

[By identity law]

Minterm normal form of $f(x_1, x_2, x_3)$

$$= [(x_3' \wedge x_2) \wedge (x_1 \vee x_1')] \vee [(x_1' \wedge x_3) \wedge (x_2 \vee x_2')] \vee [(x_2 \wedge x_3) \wedge (x_1 \vee x_1')]$$

$$= (x_3' \wedge x_2 \wedge x_1) \vee (x_3' \wedge x_2 \wedge x_1') \vee (x_1' \wedge x_3 \wedge x_2) \vee (x_1' \wedge x_3 \wedge x_2') \vee (x_2 \wedge x_3 \wedge x_1) \vee (x_2 \wedge x_3 \wedge x_1')$$

$$= (x_3' \wedge x_2 \wedge x_1) \vee (x_3' \wedge x_2 \wedge x_1') \vee (x_1' \wedge x_3 \wedge x_2) \vee (x_1' \wedge x_3 \wedge x_2') \vee (x_2 \wedge x_3 \wedge x_1) \vee (x_2 \wedge x_3 \wedge x_1').$$

Example 37.40. Express the following functions into conjunctive normal forms :

$$(i) x' \wedge y$$

$$(ii) (x \wedge y) \vee (x' \wedge y').$$

Solution. (i) $x' \wedge y = x' \wedge y \wedge (z \vee z') = (x' \wedge y \wedge z) \vee (x' \wedge y \wedge z')$.

$$(ii) (x \wedge y) \vee (x' \wedge y') = [x \wedge y \wedge (z \vee z')] \vee [x' \wedge y' \wedge (z \vee z')]$$

$$= (x \wedge y \wedge z) \vee (x \wedge y \wedge z') \vee (x' \wedge y' \wedge z) \vee (x' \wedge y' \wedge z').$$

Example 37.41. The function $f = (x \wedge y \wedge z) \vee (x \wedge y' \wedge z) \vee (x \wedge y \wedge z') \vee (x' \wedge y' \wedge z)$ is in conjunctive normal form. Write its complement ?

Solution. The complete conjunctive normal form in three variables x, y, z is $(x \wedge y \wedge z) \vee (x' \wedge y \wedge z) \vee (x \wedge y' \wedge z) \vee (x \wedge y \wedge z') \vee (x \wedge y' \wedge z') \vee (x' \wedge y' \wedge z) \vee (x' \wedge y' \wedge z')$.

\therefore The complement of the given function F is

$$F^c = (x' \wedge y \wedge z) \vee (x \wedge y' \wedge z') \vee (x' \wedge y \wedge z') \vee (x' \wedge y' \wedge z').$$

PROBLEMS 37.5

1. Find the value of a complete disjunctive normal form in

(i) two variables x, y .

(ii) three variables x, y, z .

2. Express the following functions into disjunctive normal form :

$$(i) x \vee y$$

$$(ii) x \wedge (x' \vee y).$$

3. Express the Boolean function $F = A \vee (B' \wedge C)$ in a sum of minterms.

4. Convert the function $x \wedge y'$ to disjunctive normal form in three variables x, y, z .

5. Express the function $f = (x \vee y') \wedge (x \vee z) \wedge (z \vee y)$ into conjunctive normal form in which maximum number of variables are used.

6. Write the complement of the conjunctive normal form function $(x \wedge y \wedge z') \vee (x \wedge y' \wedge z') \vee (x \wedge y \wedge z)$.

37.21 SWITCHING CIRCUITS

(1) A switching network is an arrangement of wires and switches (or gates) which connect two terminals. A switch can be either closed or open. A closed switch permits and an open switch stops flow of current

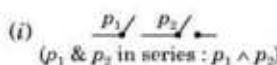

(2) If p denotes a switch, then p' denotes that switch which is open when p is closed and p' is closed when p is open.

If x denotes the state of the switch p , then x' represents the state of the switch p' . x is called the Boolean variable which is a binary variable.

If $x = 1$ denotes the switch is closed or current flows, then $x = 0$ denotes that the switch is open or current stops.

(3) Two switches p_1 and p_2 are either connected in series (represented by \wedge) or connected in parallel (represented by \vee).

These are shown as follows :

$$(p_1 \wedge p_2 \text{ in parallel} : p_1 \vee p_2)$$

If B $[0, 1]$ is non-empty set and $\wedge, \vee, /$ are the operations on B , then the system $\{[0, 1], \wedge, \vee, 1\}$ is usually called Boolean switching algebra.

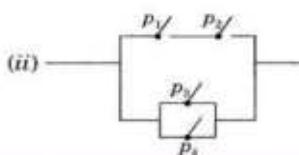

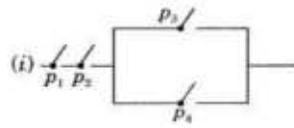

(4) Simplification of circuits. The simplification of a circuit means the least complicated circuit with minimum cost and best results. This depends on the cost of the equipment, number of switches and the type of the material used. Thus the simplification of circuits implies the use of lesser number of switches which can be achieved by using different properties of Boolean algebra. In other words, the simplification of switching circuits is equivalent to simplification of the corresponding Boolean function.

Example 37.42. Draw the circuit which represents the Boolean function :

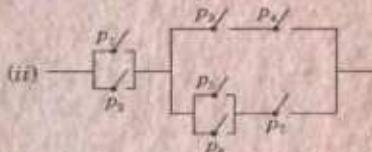

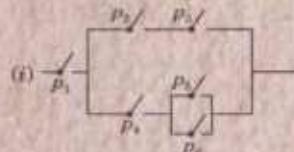

$$(i) (p_1 \wedge p_2) \wedge (p_3 \vee p_4) \quad (ii) (p_1 \wedge p_2) \vee (p_3 \vee p_4).$$

Solution. Here $p_1 \wedge p_2$ is a series circuit while $p_3 \vee p_4$ is a parallel circuit.

The required circuits are as follows :

Example 37.43. Write the Boolean functions representing the following circuits :

Also draw the circuit diagram which would be the complement of the circuit in (ii).

Solution. (i) The given circuit is represented by the Boolean function :

$$f = p_1 \wedge (p_2 \wedge p_3) \vee [p_4 \wedge (p_5 \vee p_6)]$$

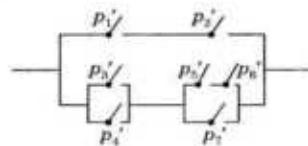

(ii) The Boolean function for the given circuit is

$$f = (p_1 \wedge p_2) \wedge [(p_3 \wedge p_4) \vee ((p_5 \vee p_6) \wedge p_7)]$$

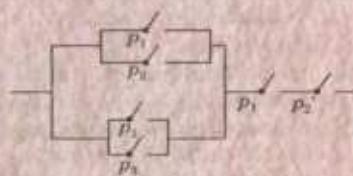

The complement of f i.e.,

$$\begin{aligned} f' &= (p_1 \vee p_2)' \vee [(p_3 \wedge p_4)' \vee ((p_5 \vee p_6) \wedge p_7)'] \\ &= (p_1' \wedge p_2') \vee [(p_3 \wedge p_4)' \wedge ((p_5 \vee p_6) \wedge p_7)'] \\ &= (p_1' \wedge p_2') \vee [(p_3' \vee p_4') \wedge ((p_5' \wedge p_6') \vee p_7')] \end{aligned}$$

Its circuit diagram is as follows :

Example 37.44. Simplify the following circuit and draw the diagram of the resulting circuit :

Solution. The given circuit is represented by the Boolean function f

$$\begin{aligned} &= [(p_1 \vee p_2) \vee (p_1 \vee p_3)] \wedge (p_1 \wedge p_2') = (p_1 \vee p_2 \vee p_3) \wedge (p_1 \wedge p_2') \\ &= (p_1 \wedge p_1 \wedge p_2') \vee (p_2 \wedge p_1 \wedge p_2') \vee (p_3 \wedge p_1 \wedge p_2') \\ &= (p_1 \wedge p_2') \vee (p_3 \wedge p_1 \wedge p_2') = p_1 \wedge [p_2' \vee (p_3 \wedge p_2')] \\ &= p_1 \wedge p_2' \end{aligned}$$

(By distributive law)

[By absorption law]

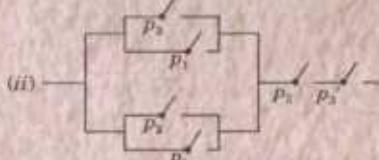

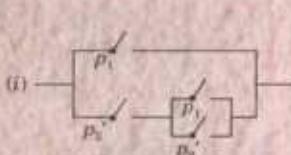

Its circuit diagram is $\overline{p_1} \overline{p_2}' \cdot -$

PROBLEMS 37.6

1. Draw the circuit diagram represented by the Boolean functions :

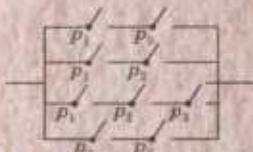

$$(i) [p_1 \wedge (p_1 \vee p_2)] \vee [p_2 \wedge (p_1' \vee p_2)] \quad (ii) p_1 \wedge [(p_2 \vee p_4) \vee (p_3' \wedge (p_1 \vee p_4 \vee p_3'))] \wedge p_2$$

2. Write the Boolean functions representing the following circuits :

3. Simplify the Boolean functions, $p \vee (p' \wedge q) \vee (p \wedge q)$

4. Simplify the following circuit and draw the diagram of the resulting circuit :

5. Draw the simplified network of $f(x, y, z) = (x \vee y \vee z) \wedge (x \vee y' \vee z) \wedge (x' \vee y' \vee z)$.

(M.P.T.U., 2001)

6. Consider the function $f(x_1, x_2, x_3) = [(x_1 \wedge x_2) \wedge (x_1 \wedge x_3)] \vee (x_1 \vee x_2)$

(a) Simplify f algebraically.

(b) Draw the switching circuit of f .

(c) Also find the minterm normal form of f .

(Madras, 1998)

IV. FUZZY SETS

37.22 FUZZY LOGIC

We have so far dealt with the fundamentals of classical logic. Besides this, we have *crisp logic* which deals with propositions that are required to be either true or false. There is however another type of logic which includes not only the crisp values but all the values between true (1) and false (0). But there is some degree of vagueness about the exact value between [0, 1]. *The logic to infer a definite outcome from such vague inputs is called fuzzy logic*.

(2) Fuzzy set. To provide a mathematical modelling to fuzzy logic, L.A. Zadeh introduced the concept of 'Fuzzy sets' in 1965 on the basis of a *membership function*. The theory of 'fuzzy sets' is now fully developed.

Def. A fuzzy set F of a non-zero set $X(x)$ is defined as $F = \{x, \mu_F(x)\} : x \in X$.

Here $\mu_F : X \rightarrow [0, 1]$ is a function called the *membership function* of F and $\mu_F(x)$ is the degree of membership of $x \in X$ in F .

In particular $\mu(x) = 1$ implies full membership

$\mu(x) = 0$ implies non-membership

and $0 < \mu(x) < 1$ means intermediate membership.

A fuzzy set F is, therefore, a set of pairs consisting of a particular element of the universe X and its degree of membership i.e., each x is assigned a value in the range (0, 1) indicating the extent to which x has the attribute F . It can also be represented as $F = \{[x_1, \mu_F(x_1)], [x_2, \mu_F(x_2)], \dots, [x_n, \mu_F(x_n)]\}$.

For example, if x is the number of cars in a lane, 'small' may be taken as a particular value of the fuzzy variable x and to each x is assigned a number in the range $(0, 1)$ then $\mu(x) \in (0, 1)$ is the membership function.

Example 37.45. In a car-race, all the cars complete the race in four time-groups : shortest time, moderate time, long time and longest time. If we note the time taken by each car in a group, it will give rise to a distribution of times. Now let us find the outcome of the race based on engine power, car speed and road conditions. Each of these variables may further be divided into :

- low, medium and high for the variable engine power,
- slow, moderate and fast for the variable car speed,
- rough, bumpy and smooth for the variable road conditions.

Now we try to predict on some basis, in which of the four groups the car will finish, if it has low engine power, moderate speed and rough road.

Then the distribution for the engine power would correspond to the membership function for low, medium and high. Similarly the distribution for the speed would depend on the membership function for slow, moderate and fast, while the distribution for road conditions would depend on membership function for rough, bumpy and smooth.

37.23 FUZZY SET OPERATIONS

(1) A fuzzy set is said to be *normalised* when the largest element of the set (called *supremum*) is unity.

For instance, the set of members $\{5, 10, 15, 20, 25\}$ is normalised to $\{0.2, 0.4, 0.6, 0.8, 1\}$ by dividing each member by 25, the supremum in the set.

The normalization of a fuzzy set F is expressed as $\sup_{x \in X} F(x) = 1$.

(2) **Complement.** The complement of a fuzzy set F is the set F^c with degree of membership of an element in F^c equal to one minus degree of membership of this element in F . (Fig. 37.5)

For example, if $F = \{0.4 \text{ Ram}, 0.6 \text{ Sham}, 0.8 \text{ Jyoti}, 0.9 \text{ Ritu}\}$ be a set of intelligent students, then $F^c = \{0.6 \text{ Ram}, 0.4 \text{ Sham}, 0.2 \text{ Jyoti}, 0.1 \text{ Ritu}\}$ is a set of non-intelligent students.

Fig. 37.5

Fig. 37.6

(3) **Intersection.** The intersection of two fuzzy sets F and G is the set $F \cap G$, where the degree of membership of an element in $F \cap G$ is the minimum of the degrees of membership of this element in F and G . (Fig. 37.6)

(4) **Union.** The union of two fuzzy sets F and G is the set $F \cup G$, where the degree of membership of an element in $F \cup G$, is the maximum of this element in F and G . (Fig. 37.7)

For example, if

$$F = \{0.5 \text{ Rani}, 0.2 \text{ Suman}, 0.4 \text{ Anita}, 0.8 \text{ Sunita}\}$$

be a set of fat girls, and

$$G = \{0.1 \text{ Rani}, 0.6 \text{ Suman}, 0.9 \text{ Anita}, 0.5 \text{ Sunita}\}$$

be a set of tall girls, then

$$F \cap G = \{0.1 \text{ Rani}, 0.2 \text{ Suman}, 0.4 \text{ Anita}, 0.5 \text{ Sunita}\}$$

and

$$F \cup G = \{0.5 \text{ Rani}, 0.6 \text{ Suman}, 0.9 \text{ Anita}, 0.8 \text{ Sunita}\}$$

(5) **Equality.** Two fuzzy sets F and G are said to be equal if and only if $F(x) = G(x)$ for all x in X .

(6) **Subset.** The fuzzy set F is said to be a subset of the fuzzy set G (i.e., $F \subseteq G$) if and only if $F(x) \leq G(x)$ for all $x \in X$.

(7) **Double negation.** If F is a fuzzy set, then $(F^c)^c = 1$.

(8) **De Morgan's laws.** If F and G are two fuzzy sets then

$$(F \cup G)^c = F^c \cap G^c ; (F \cap G)^c = F^c \cup G^c.$$

Example 37.46. Let the membership functions for the fuzzy sets F and G be as in the following table :

X	1	2	3	4	5	6	7	8	9	10
F	0	0	0.1	0.5	0.8	1	0.3	0.5	0	0
G	0	0	0	0	0.1	0.3	0.5	0.8	1	1
F^c	1	1	0.9	0.5	0.2	0	0.7	0.5	1	1

Then the corresponding

$$F \cap G = [0, 0.1, 0.3, 0.5]$$

$$F \cup G = [0.1, 0.5, 0.8, 1, 0.5, 0.8, 1, 1]$$

Clearly F is not a subset of G and G is not a subset of F .

37.24 TRUTH VALUE

(1) Truth value of the negation of a proposition in fuzzy logic is one minus the truth value of the proposition.

For example, if the truth value of the statement 'Ram is happy' is 0.8, then the truth value of 'Ram is not happy' is 0.2.

(2) Truth value of the conjunction of two propositions in the fuzzy logic is the minimum of the truth values of the two propositions.

(3) Truth value of the disjunction of two propositions in the fuzzy logic is the maximum of the truth values of two propositions.

For example, if the truth value of 'Ram is fat' is 0.6, and the truth value of 'John is fat' is 0.9, then the truth value of the statement

(a) 'Ram and John are fat' is 0.6.

(b) 'Ram or John is fat' is 0.9.

(c) 'neither Ram nor John is fat' is negation of minimum of negation of 'Ram is fat' (i.e., 0.4) and negation of 'John is fat' (i.e., 0.1) = 0.1.

(d) 'Ram is not fat or John is not fat' is maximum of 0.4 and 0.1 i.e., 0.4.

37.25 ALGEBRAIC OPERATIONS ON FUZZY SETS

(1) Algebraic sum of two fuzzy sets F and G is defined by the membership function

$$\mu_{F+G}(x) = \mu_F(x) + \mu_G(x) - \mu_F(x)\mu_G(x)$$

and is written as $F + G$.

Algebraic product of two fuzzy sets F and G is defined by the membership function.

$$\mu_{F.G.}(x) = \mu_F(x).\mu_G(x)$$

and is written as $F.G.$

(2) Properties of fuzzy set operations which are common to crisp set operations, are as under

1. *Idempotent* : $F \cup F = F$, $F \cap F = F$

2. *Identity* : $F \cup \emptyset = F$, $F \cap U = F$

3. *Commutative* : $F \cup G = G \cup F$, $F \cap G = G \cap F$

4. *Distributive* : $F \cap (G \cup H) = (F \cap G) \cup (F \cap H)$, $F \cup (G \cap H) = (F \cup G) \cap (F \cup H)$

5. *Associative* : $(F \cup G) \cup H = F \cup (G \cup H)$, $(F \cap G) \cap H = F \cap (G \cap H)$

6. *Absorption* : $F \cup (F \cap G) = F$, $F \cap (F \cup G) = F$.

37.26 GENERATION OF RULES FOR FUZZY PROBLEMS

We should know before hand all possible input-output relations while dealing with problems concerning fuzzy engines or fuzzy controls. These input-output rules are then expressed with 'if ... then' statements.

For instance, if F 's and G 's are inputs of fuzzy problems and R 's are the actions taken for each rule, then the set of 'if ... then' rules with two input variables F_1 and G_1 and the actions taken are shown in table 1.

- i.e., if F_1 and or G_1 , then R_{11} , else
 if F_2 and or G_1 , then R_{21} , else
 if F_1 and or G_2 , then R_{12} , else
 if F_2 and or G_2 , then R_{22} .

F_1	R_{11}	R_{12}
F_2	R_{21}	R_{22}
G_1	G_2	

In case, the fuzzy statements have more variables, then 'if ... then' rules becomes more complicated to tabulate.

However such a tabulation can be simplified by following a *decomposition process* as follows :

The decomposition process of three fuzzy variables F , G and H with actions R 's taken is shown below :

Table 2

F_1	R_{11}	R_{12}
F_2	R_{21}	R_{22}
G_1	G_2	

Table 3

H_1	R_{111}	R_{121}	R_{211}	R_{221}
H_2	R_{112}	R_{122}	R_{212}	R_{222}
R_{11}	R_{12}	R_{21}	R_{22}	

Here the statements F_2 and G_1 and H_1 then R_{211} is decomposed into 'if F_2 and G_1 then R_{21} ' and 'if R_{21} and H_1 , then R_{211} '.

Similarly R_{21} and H_2 then R_{212} .

This decomposition process can easily be extended to any number of input variables.

37.27 FUZZY PROPOSITIONS

(1) A *fuzzy number* is a fuzzy set $R \rightarrow [0, 1]$. We can easily extend classical two-valued logic to three-valued logic. Fuzzy logic, however is an extension of multi-valued logic. It provides foundations for approximate reasoning with imprecise fuzzy propositions using fuzzy set theory.

The classical propositions are statements which are either true or false. In fuzzy logic, the truth or falsity of fuzzy propositions is assigned different degrees i.e., the truth and falsity are expressed by numbers in $[0, 1]$.

A variable whose values are 'words' or 'sentences' is called a *linguistic variable*. For example 'height' is a linguistic variable and its values are tall, very tall, quite tall, not tall, short, not very short, not quite tall etc.

(2) **Classification of fuzzy propositions.** The classification propositions are statements which are either true or false. In fuzzy logic, the truth or falsity of fuzzy propositions is assigned different degrees i.e., the truth and falsity are expressed by numbers in $[0, 1]$.

The fuzzy propositions of simple nature can be classified into the following four types. In each case, we introduce the relevant canonical form and then discuss its interpretation.

Type I. Unconditional and unqualified propositions.

The standard canonical form of this type of proposition is expressed as $p : u$ if F ... (1)

Here u is the variable that takes value u from some universal set U and F is a fuzzy set on U which represents a fuzzy predicate such as young, tall, low, high etc. Given a particular value u (say v), this value belongs to F with membership grade $F(v)$. This membership grade is then interpreted as the degree of truth $T(p)$ of proposition p .

i.e.,

$$T(p) = F(v) \quad \dots(2)$$

Here T is a fuzzy set on $[0, 1]$ which assigns the membership grade $F(v)$ to each value v of u .

In some fuzzy propositions, values of variable u in (1) are assigned to individuals in a given set I i.e., variable u becomes a function $u : I \rightarrow u$ where $u(i)$ is the value of v for individual i in U . Accordingly the canonical form (2) is modified to the form

$$p : u(i) \text{ is } F \text{ where } i \in I \quad \dots(3)$$

Example 37.47. Consider a set I of persons, each person is characterized by his 'age' and a fuzzy set expressing the predicate 'young' is given. Denoting our variable by 'age' and fuzzy set by 'young', the canonical form is

$$p : \text{age}(i) \text{ is young.}$$

Solution. The degree of truth of this proposition $T(p)$ is then determined for each person i in I by means of the equation $T(p) = \text{young}[\text{age}(i)]$.

Example 37.48. At a particular place on the earth, consider the air temperature u (in $^{\circ}\text{C}$). Let Fig. 37.8 represent the membership function as predicate 'high'. Assuming that all relevant temperature readings are given, the corresponding fuzzy proposition is expressed as,

$$p : \text{temp}(u) \text{ is high } (^{\circ}\text{C})$$

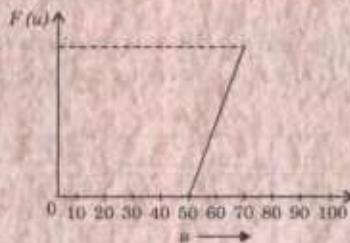

Fig. 37.8

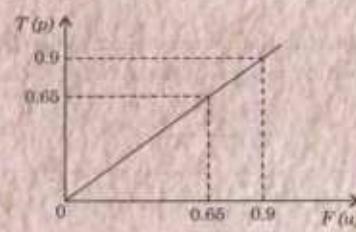

Fig. 37.9

Solution. The degree of truth $T(p)$ depends upon the actual value of the temperature and on the nature of predicate 'high' which is defined by the membership function F in Fig. 37.8.

e.g., if $u = 75$ then $F(75) = 0.65$ and $T(p) = 0.65$.

Type II. Conditional and unqualified propositions.

A proposition p of this type is expressed by the canonical form

$$p : \text{If } x \text{ is } F \text{ then } y \text{ is } G \quad \dots(4)$$

where x, y are variables whose values are in the sets X, Y and F, G are fuzzy sets on X and Y respectively. These propositions may also be viewed as propositions of the form

$$\{x, y\} \text{ is } R \quad \dots(5)$$

where R is a fuzzy set on $X \times Y$ which is determined for each $x \in X$ and each $y \in Y$ by the formula

$$R(x, y) = B[F(x), G(y)], \quad \dots(6)$$

where B is a binary operation as $[0, 1]$ representing a suitable *fuzzy implication*.

Type III. Unconditional and qualified propositions

A proposition of this type is expressed by either of the following canonical forms :

$$p : u \text{ is } F \text{ is } S \quad \dots(7)$$

or

$$p : \text{Prob}(U \text{ is } F) \text{ is } P \quad \dots(8)$$

where u is a variable that takes value v from some universal set U and F is a fuzzy set on U which represents a fuzzy predicate such as small, young, daughter etc.

Prob. (U is F) is the probability of fuzzy set event ' u is F '; S is the fuzzy truth qualifier and P is the fuzzy probability qualifier. S and P are both represented by fuzzy set on $[0, 1]$.

Example 37.49. Mary is 'young' is 'very true' where the predicate 'young' and the truth qualifier 'very true' are represented by the respective fuzzy sets shown in Fig. 37.10.

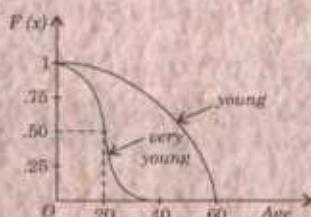

Fig. 37.10

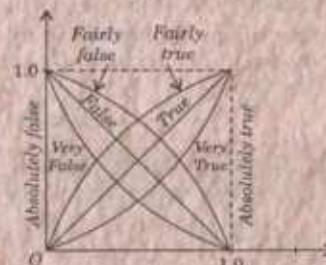

Fig. 37.11

Solution. The degree of truth $T(p)$ of any truth-qualified proposition p is given for each $u \in U$ by $T(p) = S(F(u))$.

Assuming that Mary's age is 20, she belongs to the set representing the predicate 'very young' with membership grade 0.50, our proposition belongs to the set of propositions which are 'very true' with membership grade 0.50 as shown in Fig. 37.11. This implies that the degree of truth of our truth qualified proposition is 0.50.

If the proposition be modified by changing the predicate to 'young' or the truth qualifier to 'fairly true', we would obtain the corresponding degree of truth of such propositions by the same method.

Type IV. Conditional and qualified propositions

This type of propositions can either be expressed in the canonical form

$$p : \text{If } x \text{ is } F, \text{ then } y \text{ is } G \text{ in } S$$

or

$$p : \text{Prob}\{x \text{ is } F/y \text{ is } G\} \text{ in } P,$$

where Prob $\{x \text{ is } F/y \text{ is } G\}$ is conditional probability.

37.28 APPLICATIONS OF FUZZY SETS

The concept of fuzzy sets has already influenced all engineering disciplines to various degrees.

Electrical engineering is the first such discipline where the utility of fuzzy logic and fuzzy sets has been recognized by developing controllers. Electronic circuits for fuzzy image processing have also been developed.

Some ideas regarding the application of fuzzy sets in *civil engineering* emerged around 1970. In the construction of bridges, dams, buildings etc. a designer has to take into account the safety factor for which the fuzzy theory has an effective role to play. Fuzzy set theory has also proved quite useful for assessing the life of existing constructions.

In *mechanical engineering* design problems, the utility of Fuzzy set theory was realised during mid 1980's. The membership function is expressed in terms of thermal expansion or corrosion or cost of different materials etc.

When the utility of fuzzy controllers was increasingly felt around mid 1980's, the need for computer hardware to implement the various operations involving fuzzy logic, had been recognized. In digital mode, fuzzy sets have been expressed as vectors of $(0, 1)$ members.

Fuzzy control and fuzzy decision making are two well-developed areas of fuzzy set theory. These are directly relevant to *industrial engineering problems*. The utility of fuzzy sets has also been recognized for estimating the service life of given equipment under various conditions.

Modern Reliability theory has also been developed on the assumption of fuzzy sets. At any given time, an engineering product may be in functioning state to some degree or in failed state to another degree. The behaviour of an engineering product with respect to its functioning state and failed state has been characterized as based on fuzzy set theory.

The use of fuzzy set theory in *Robotics* includes approximate reasoning, fuzzy controllers, fuzzy pattern recognition and fuzzy data bases.

PROBLEMS 37.7

- Given fuzzy sets $F_1 = [0.6 \text{ Sonu}, 0.9 \text{ Renu}, 0.7 \text{ Paul}, 0.3 \text{ Sham}]$
 $F_2 = [0.3 \text{ Sham}, 0.8 \text{ Paul}, 0.9 \text{ Renu}, 0.5 \text{ Sonu}]$
and $F_3 = [0.8 \text{ Paul}, 0.3 \text{ Sham}, 0.5 \text{ Sonu}, 0.9 \text{ Renu}]$
Which of the above two sets are equal?
- Write the complement set of the fuzzy set F , if $F = [0.8 \text{ Ram}, 0.3 \text{ Sham}, 0.6 \text{ John}, 0.7 \text{ Charu}]$.
- If $F = [0.3x_1, 0.7x_2, 0.5x_3, 0.8x_4]$ and $G = [0.4x_1, 0.6x_2, 0.1x_3, 0.9x_4]$ be two fuzzy sets, then write down $F \cup G$ and $F \cap G$.
- State the truth values of the negation of the following propositions :
 - Truth value of 'F is rich' is 0.8
 - Truth value of 'G is fat' is 0.6
 - Truth value of 'Mary is beautiful' is 0.7.
- Let the membership functions of fuzzy sets F and G be as follows :
 $X : \{1, 2, 3, 4, 5, 6, 7, 8, 9, 10\}$

$$F : [0, 0, 0, 0, 0.1, 0.3, 0.5, 0.9, 1, 1]$$

$$G : [0, 0, 0.1, 0.5, 0.9, 1, 0.9, 0.5, 0.0]$$

State whether (i) $F = G$ (ii) F is a subset of G .

Also write down F' , $F \cap G$ and $F \cup G$.

6. The truth values of the statements

'Latif is a good player' is 0.7

and 'John is a good player' is 0.6.

What is the truth value of

- (i) the conjunction of the above two prepositions.
(ii) the disjunction of the above prepositions.

7. Define a Fuzzy set and the standard operations on Fuzzy sets. (Bhopal, 2009)

8. State the constituents of the pair in a fuzzy set.

9. Write a note on 'Fuzzy logic affects many disciplines' ? (Bhopal, 2001)

38.1 INTRODUCTION

Some physical quantities are specified by their magnitude only while others by their magnitude and direction. But certain quantities are associated with two or more directions. Such a quantity is called a *tensor*. The stress at a point of an elastic solid is an example of a tensor which depends on two directions—one normal to the area and other that of the force on it.

The properties of tensors are independent of the frames of reference used to describe them. That is why Einstein found tensors as a convenient tool for formulation of his Relativity theory. Since then, the subject of tensor analysis shot into prominence and is of great use in the study of Riemannian geometry, mechanics, elasticity, electro-magnet theory and numerous other fields of science and engineering. The emergence of tensor calculus as a symmetric subject is due to Ricci and his student Levi-Cita.

38.2 SUMMATION CONVENTION

Consider a sum of the type

$$a_1x_1 + a_2x_2 + \dots + a_nx_n \quad i.e., \quad \sum_{i=1}^n a_i x_i \quad \dots(1)$$

In tensor analysis, the subscripts of the symbols x_1, x_2, \dots, x_n are replaced by superscripts and we write these as x^1, x^2, \dots, x^n . The superscripts do not stand for the various powers of x but act as labels to distinguish different symbols. The power of a symbol (say : x^i) will be indicated as $(x^i)^2, (x^i)^3$ etc. Hence (1) is written as

$$\sum_{i=1}^n a_i x^i. \quad \dots(2)$$

A still simpler notation is to drop the Σ sign and write (2) as $a_i x^i$...(3)

In this the repeated index i successively takes up the values 1, 2, ..., n and the expression (3) represents the sum of all such terms. The repeated index i over which the summation is to be done, is called a *dummy index* since it doesn't appear in the final result. This notation, known as *summation convention*, is due to Einstein. We shall adopt this convention throughout this chapter and take the sum whenever a letter appears in a term once as a subscript and once as superscript.

Example 38.1. Write the terms contained in $S = a_{ij}x^i x^j$ taking $n = 3$.

Solution. Since the index i occurs both as a subscript and as a superscript, we first sum on i from 1 to 3.

$$\therefore S = a_{1j}x^1 x^j + a_{2j}x^2 x^j + a_{3j}x^3 x^j$$

Now each term in S has to be summed up w.r.t. repeated index j from 1 to 3.

$$\begin{aligned}\therefore S &= a_{11}x^1 x^1 + a_{12}x^1 x^2 + a_{13}x^1 x^3 + a_{21}x^2 x^1 + a_{22}x^2 x^2 + a_{23}x^2 x^3 \\ &\quad + a_{31}x^3 x^1 + a_{32}x^3 x^2 + a_{33}x^3 x^3 \\ &= a_{11}(x^1)^2 + a_{22}(x^2)^2 + a_{33}(x^3)^2 + (a_{12} + a_{21})x^1 x^2 + (a_{13} + a_{31})x^1 x^3 + (a_{23} + a_{32})x^2 x^3.\end{aligned}$$

Example 38.2. If f is a function of n variables x^i , write the differential of f .

Solution. Since $f = f(x^1, x^2, \dots, x^n)$

\therefore From Calculus, we have

$$df = \frac{\partial f}{\partial x^1} dx^1 + \frac{\partial f}{\partial x^2} dx^2 + \dots + \frac{\partial f}{\partial x^n} dx^n = \frac{\partial f}{\partial x^i} dx^i.$$

38.3 (1) TRANSFORMATION OF COORDINATES

In a 3-dimensional space, the coordinates of a point are (x^1, x^2, x^3) referred to a particular frame of reference. Similarly in an n -dimensional space, the coordinates of a point are n independent variables (x^1, x^2, \dots, x^n) with respect to a certain frame of reference. Let $(\bar{x}^1, \bar{x}^2, \dots, \bar{x}^n)$ be the coordinates of the same point referred to another frame of reference. Suppose, $\bar{x}^1, \bar{x}^2, \dots, \bar{x}^n$ are independent single-valued functions of x^1, x^2, \dots, x^n so that

$$\bar{x}^1 = \phi^1(x^1, x^2, \dots, x^n)$$

$$\bar{x}^2 = \phi^2(x^1, x^2, \dots, x^n)$$

.....

$$\bar{x}^n = \phi^n(x^1, x^2, \dots, x^n)$$

or more briefly

$$\bar{x}^i = \phi^i(x^1, x^2, \dots, x^n) \quad \dots(1)$$

We can solve the equations (1) and express x^i as functions of \bar{x}^i so that

$$x^i = \psi^i(\bar{x}^1, \bar{x}^2, \dots, \bar{x}^n) \quad \dots(2)$$

The equations (1) and (2) are said to define a transformation of the coordinates from one frame of reference to another.

(2) Scalars or invariants. A function $\phi(x^1, x^2, x^3)$ is called a scalar or an invariant if its original value does not change upon transformation of coordinates from x^1, x^2, x^3 to $\bar{x}^1, \bar{x}^2, \bar{x}^3$.

i.e., $\phi(x^1, x^2, x^3) = \psi(\bar{x}^1, \bar{x}^2, \bar{x}^3)$

A scalar or invariant is also called a tensor of order (or rank) zero.

38.4 KRONECKER DELTA*

The quantity δ_i^j defined by the relations

$$\delta_i^j = 0, \quad \text{when } j \neq i$$

and $\delta_i^j = 1, \quad \text{when } j = i$, is called Kronecker delta.

Evidently $\delta_1^1 = \delta_2^2 = \delta_3^3 = \dots = \delta_n^n = 1$

while $\delta_1^2 = \delta_2^3 = \delta_3^2 = \dots = 0$

*Called after the German mathematician Leopold Kronecker (1823–91) who made important contributions to number theory, algebra and group theory.

We note that by summing up w.r.t. the repeated index j ,

$$\begin{aligned} \delta_{ij}\delta_{jk}^j &= a_{31}\delta_{21}^1 + a_{32}\delta_{22}^2 + a_{33}\delta_{23}^3 + a_{34}\delta_{24}^4 + \dots \\ &= 0 + a_{32} + 0 + 0 = a_{32} \end{aligned}$$

In general,

$$\begin{aligned} a_{ij}\delta_{jk}^j &= a_{i1}\delta_{k1}^1 + a_{i2}\delta_{k2}^2 + \dots + a_{ik}\delta_{kk}^k + \dots + a_{in}\delta_{kn}^n \\ &= 0 + 0 + \dots + a_{ik} \cdot 1 + \dots + 0 = a_{ik} \end{aligned}$$

Example 38.3. Show that $a_{ij}A^{kj} = \Delta\delta_i^k$, where Δ is a determinant of order three and A^{ij} are cofactors of a^{ij} . (Delhi, 2002)

Solution. By expansion of determinants, we have

$$\begin{aligned} a_{11}A^{11} + a_{12}A^{12} + a_{13}A^{13} &= \Delta \\ a_{11}A^{21} + a_{12}A^{22} + a_{13}A^{23} &= 0 \\ a_{11}A^{31} + a_{12}A^{32} + a_{13}A^{33} &= 0 \end{aligned}$$

which can be compactly written as

$$a_{1j}A^{1j} = \Delta, a_{1j}A^{2j} = 0, a_{1j}A^{3j} = 0$$

Using Kronecker delta notation, these can be combined into a single equation

$$a_{1j}A^{kj} = \Delta\delta_1^k$$

Similarly

$$a_{2j}A^{kj} = \Delta\delta_2^k, a_{3j}A^{kj} = \Delta\delta_3^k$$

All these nine equations are included in $a_{ij}A^{kj} = \Delta\delta_i^k$.

Example 38.4. If x^i and \bar{x}^i are independent coordinates of a point, show that

$$\frac{\partial x^j}{\partial x^k} \frac{\partial \bar{x}^k}{\partial x^l} = \delta_l^j.$$

Solution. The partial derivatives of ϕ in the two coordinate systems are different and are connected by the following formula of Differential Calculus :

$$\frac{\partial \phi}{\partial x^i} = \frac{\partial \phi}{\partial \bar{x}^1} \cdot \frac{\partial \bar{x}^1}{\partial x^i} + \frac{\partial \phi}{\partial \bar{x}^2} \cdot \frac{\partial \bar{x}^2}{\partial x^i} + \frac{\partial \phi}{\partial \bar{x}^3} \cdot \frac{\partial \bar{x}^3}{\partial x^i} = \frac{\partial \phi}{\partial \bar{x}^k} \frac{\partial \bar{x}^k}{\partial x^i}$$

$$\text{In particular, when } \phi = x^i, \text{ we have } \frac{\partial x^j}{\partial x^i} = \frac{\partial x^j}{\partial \bar{x}^k} \frac{\partial \bar{x}^k}{\partial x^i} \quad \dots(i)$$

$$\left. \begin{array}{l} \text{Since } x^j \text{ is independent of } x^i, \frac{\partial x^j}{\partial x^i} = 0, \text{ when } j \neq i \\ = 1, \text{ when } j = i \end{array} \right\} \quad \dots(ii)$$

Hence the result follows from (i) and (ii).

38.5 (1) CONTRAVARIANT VECTORS

Let A^1, A^2, \dots, A^n (i.e., A^i) be a set of n functions of the coordinate system x^1, x^2, \dots, x^n (i.e., x^i). If these transform in another system of coordinates $\bar{x}^1, \bar{x}^2, \dots, \bar{x}^n$ (i.e., \bar{x}^i) according to the law

$$\bar{A}^i = \frac{\partial \bar{x}^i}{\partial x^j} A^j \quad \dots(1)$$

then A^i are called components of a **contravariant vector or contravariant tensor of order one**.

An example of a contravariant vector. Let us transform the coordinates of a point x^i to \bar{x}^i in a n -dimensional space.

Since x is a function of x^i (i.e., x_1, x_2, \dots, x_n), therefore,

$$\begin{aligned} dx^i &= \frac{\partial \bar{x}^i}{\partial x^1} dx^1 + \frac{\partial \bar{x}^i}{\partial x^2} dx^2 + \dots + \frac{\partial \bar{x}^i}{\partial x^n} dx^n \\ &= \frac{\partial \bar{x}^i}{\partial x^j} dx^j, \text{ using the summation convention.} \end{aligned}$$

Comparing this with (1), it follows that *the set of differentials dx^1, dx^2, \dots, dx^n is an example of a contravariant vector*. That is why the coordinates of a point are numbered by superscripts and not by subscripts.

(2) Covariant vectors. Let A_i be a set of n functions of the coordinate system x^i . If these transform in another system of coordinates \bar{x}^i according to the law

$$\bar{A}_i = \frac{\partial \bar{x}^i}{\partial x^j} A_j \quad \dots(2)$$

then A_i are called the components of a covariant vector or covariant tensor of order one.

An example of a covariant vector. Let ϕ be a function which has a fixed value at each point of space independent of the coordinate system employed. Therefore, ϕ is a function of the coordinates x^i in the first system and a function of the coordinates \bar{x}^i in the second system. By the chain rule

$$\frac{\partial \phi}{\partial \bar{x}^i} = \frac{\partial \phi}{\partial x^1} \frac{\partial x^1}{\partial \bar{x}^i} + \frac{\partial \phi}{\partial x^2} \frac{\partial x^2}{\partial \bar{x}^i} + \dots + \frac{\partial \phi}{\partial x^n} \frac{\partial x^n}{\partial \bar{x}^i} = \frac{\partial \phi}{\partial x^1} \frac{\partial \bar{x}^1}{\partial \bar{x}^i} + \frac{\partial \phi}{\partial x^2} \frac{\partial \bar{x}^2}{\partial \bar{x}^i} + \dots + \frac{\partial \phi}{\partial x^n} \frac{\partial \bar{x}^n}{\partial \bar{x}^i}$$

Comparing this equation with (2), it follows that *the set of derivatives*,

$$\frac{\partial \phi}{\partial \bar{x}^1}, \frac{\partial \phi}{\partial \bar{x}^2}, \dots, \frac{\partial \phi}{\partial \bar{x}^n}$$

form a covariant vector.

Example 38.5. A covariant tensor has components $xy, 2y - z^2, xz$ in rectangular coordinates. Find its covariant components in spherical coordinates.

Solution. Here

$$\left. \begin{aligned} x^1 &= x, x^2 = y, x^3 = z \\ \bar{x}^1 &= r, \bar{x}^2 = \theta, \bar{x}^3 = \phi \end{aligned} \right\} \quad \dots(i)$$

and

Let

$$A_1 = xy, A_2 = 2y - z^2, A_3 = xz \quad \dots(ii)$$

According to the law of transformation, we have $\bar{A}_i = \frac{\partial \bar{x}^i}{\partial x^j} A_j \quad (i = 1, 2, 3)$

and we wish to evaluate $\bar{A}_1, \bar{A}_2, \bar{A}_3$ where A_1, A_2, A_3 are known.

We know that $x = r \sin \theta \cos \phi, y = r \sin \theta \sin \phi, z = r \cos \theta$...(iii)

$$\begin{aligned} \text{Now } \bar{A}_1 &= \frac{\partial \bar{x}^1}{\partial x^1} A_1 + \frac{\partial \bar{x}^1}{\partial x^2} A_2 + \frac{\partial \bar{x}^1}{\partial x^3} A_3 = \frac{\partial \bar{x}^1}{\partial r} xy + \frac{\partial \bar{x}^1}{\partial \theta} (2y - z^2) + \frac{\partial \bar{x}^1}{\partial \phi} xz \quad [\text{From (i) and (ii)}] \\ &= \sin \theta \cos \phi \cdot r \sin \theta \cos \phi \cdot r \sin \theta \sin \phi + \sin \theta \sin \phi (2r \sin \theta \sin \phi - r^2 \cos^2 \theta) \\ &\quad + \cos \theta \cdot r \sin \theta \cos \phi \cdot r \cos \theta \quad [\text{From (iii)}] \end{aligned}$$

$$\begin{aligned} \text{Similarly } \bar{A}_2 &= \frac{\partial \bar{x}^2}{\partial x^1} A_1 + \frac{\partial \bar{x}^2}{\partial x^2} A_2 + \frac{\partial \bar{x}^2}{\partial x^3} A_3 = r \cos \theta \cos \phi \cdot r \sin \theta \cos \phi \cdot r \sin \theta \sin \phi \\ &\quad + r \cos \theta \sin \phi (2r \sin \theta \sin \phi - r^2 \cos^2 \theta) + (-r \sin \theta) r \sin \theta \cos \phi \cdot r \cos \theta \end{aligned}$$

and

$$\begin{aligned} \bar{A}_3 &= \frac{\partial \bar{x}^3}{\partial x^1} A_1 + \frac{\partial \bar{x}^3}{\partial x^2} A_2 + \frac{\partial \bar{x}^3}{\partial x^3} A_3 \\ &= -r \sin \theta \sin \phi \cdot r \sin \theta \cos \phi \cdot r \sin \theta \sin \phi \\ &\quad + r \sin \theta \cos \phi (2r \sin \theta \sin \phi - r^2 \cos^2 \theta) + 0 \end{aligned}$$

38.6 TENSORS OF HIGHER ORDER

Let i and j be each given values 1 to n , then the symbol A^{ij} will give rise to n^2 functions.

(1) If A^{ij} be a set of n^2 functions of the coordinates x^1, x^2, \dots, x^n which transforms to \bar{A}^{ij} in another system of coordinates $\bar{x}^1, \bar{x}^2, \dots, \bar{x}^n$, according to the law

$$\bar{A}^{ij} = \frac{\partial \bar{x}^i}{\partial x^k} \frac{\partial \bar{x}^j}{\partial x^l} A^{kl} \quad \dots(1)$$

then the functions \bar{A}^{ij} are said to be components of a contravariant tensor of the second order.

(2) If A_{ij} be a set of n^2 functions of x^1, x^2, \dots, x^n which transform to \bar{A}_{ij} in another system of coordinates, $\bar{x}^1, \bar{x}^2, \dots, \bar{x}^n$ according to the law

$$\bar{A}_{ij} = \frac{\partial \bar{x}^k}{\partial x^i} \frac{\partial \bar{x}^l}{\partial x^j} A_{kl}, \quad \dots(2)$$

then the functions \bar{A}_{ij} are said to be the components of a covariant tensor of the second order.

(3) If A^i_j be a set of n^2 functions of x^1, x^2, \dots, x^n which transform to \bar{A}_j^i in another system of coordinates, $\bar{x}^1, \bar{x}^2, \dots, \bar{x}^n$, according to the law

$$\bar{A}_j^i = \frac{\partial \bar{x}^i}{\partial x^k} \cdot \frac{\partial x^l}{\partial \bar{x}^j} A^k_l, \quad \dots(3)$$

then \bar{A}_j^i are said to be the components of a mixed tensor of the second order. It transforms like a contravariant vector with respect to the index i and like a covariant vector with regard to the index j . That is why i is placed as a superscript and j as subscript.

We can similarly define tensors of the orders higher than two.

Obs. Each of the above laws of transformation (1) to (3), give rise to n^2 equations as i and j are each given the value 1 to n .

Example 38.6. Show that the Kronecker delta is a mixed tensor of order two.

Solution. If δ_i^j transforms to $\bar{\delta}_i^j$ in the coordinate system $\bar{x}^1, \bar{x}^2, \dots, \bar{x}^n$ by the law for mixed tensors of order two, then

$$\bar{\delta}_i^j = \frac{\partial \bar{x}^l}{\partial x^i} \frac{\partial \bar{x}^j}{\partial x^m} \delta_l^m = \frac{\partial \bar{x}^j}{\partial x^m} \cdot \frac{\partial x^m}{\partial x^i} = \bar{\delta}_i^j \quad [:\; \delta_l^m = 0 \text{ for } l \neq m]$$

Hence δ_i^j is a mixed tensor of order two, having the same components in every coordinate system.

Example 38.7. Show that the velocity of a fluid at any point is a contravariant tensor of rank one.

Solution. Let $dx^1/dt, dx^2/dt, dx^3/dt$ be the components of fluid velocity of the point (x^1, x^2, x^3) , i.e., dx^i/dt be the components of velocity in the coordinate system x^i . Suppose the corresponding components of velocity in the coordinate system \bar{x}^i are $d\bar{x}^i/dt$. Then $\bar{x}^1, \bar{x}^2, \bar{x}^3$ being the functions of x^1, x^2, x^3 which in turn are functions of t , we can write

$$\begin{aligned} \frac{d\bar{x}^j}{dt} &= \frac{\partial \bar{x}^j}{\partial x^1} \frac{dx^1}{dt} + \frac{\partial \bar{x}^j}{\partial x^2} \frac{dx^2}{dt} + \frac{\partial \bar{x}^j}{\partial x^3} \frac{dx^3}{dt} \\ \text{or} \quad \frac{d\bar{x}^j}{dt} &= \frac{\partial \bar{x}^j}{\partial x^i} \frac{dx^i}{dt} \end{aligned} \quad \dots(i)$$

Now according to the law of tensor transformation, (i) shows that the velocity of a fluid is a contravariant tensor of rank one.

Example 38.8. Prove that there is no distribution between contravariant and covariant vectors if the transformation law is of the form $\bar{x}^i = a_m^i x^m + b^i$, where a 's and b 's are constants such that $a^i a_m^i = \delta_m^i$.
(Bhopal, 2003)

Solution. Given transformation $\bar{x}^i = a_m^i x^m + b^i$... (i)

yields

$$\frac{\partial \bar{x}^i}{\partial x^m} = a^i_m \quad \dots(ii)$$

Also from (i),

$$\begin{aligned} a^i_r \bar{x}^i &= a^i_r a_m^i x^m + a^i_r b^i \\ &= \delta_m^r x^m + a^i_r b^i = x^r + a^i_r b^i. \end{aligned}$$

$$\therefore \frac{\partial x^r}{\partial \bar{x}^i} = a^i_r \quad \text{i.e.,} \quad \frac{\partial x^m}{\partial \bar{x}^i} = a^i_m \quad \dots(iii)$$

From (ii) and (iii), it is clear that any vector with components a, b, c will on transformation give the same components whether transformed as a contravariant vector or as a covariant vector. Thus in this case, there is no distinction between the two.

38.7 SYMMETRIC AND SKEW-SYMMETRIC TENSORS

(1) A tensor is said to be **symmetric** with respect to two contravariant (or two covariant) indices if its components remain unchanged on an interchange of the two indices.

Thus the tensor A^{ij} is symmetric if $A^{ij} = A^{ji}$, for every i and j .

(2) A tensor is said to be **skew-symmetric** with respect to two contravariant (or covariant) indices, if its components change sign on interchange of the two indices.

Thus the tensor A^{ij} is skew-symmetric if $A^{ij} = -A^{ji}$ for every i and j .

In general, the tensor A_{lm}^{ijk} is said to be symmetric or skew symmetric in i and j according as

$$A_{lm}^{ijk} = A_{lm}^{jik} \quad \text{or} \quad -A_{lm}^{jik}$$

Example 38.9. Show that (i) a symmetric tensor of the second order has only $\frac{1}{2}n(n + 1)$ different components.

(ii) A skew-symmetric tensor of the second order has only $\frac{1}{2}n(n - 1)$ different non-zero components.

Solution. (i) Let A^{ij} be a symmetric tensor of order two so that $A^{ij} = A^{ji}$.

If each of the indices i and j take the values 1 to n , then A^{ij} will have n^2 components. Out of these n^2 components, n components $A_{11}, A_{22}, \dots, A_{nn}$ are independent.

Thus the remaining components are $(n^2 - n)$ which can be taken in pairs ($\because A_{12} = A_{21}, A_{31} = A_{13}$ etc.)

Hence the total number of independent components

$$= n + \frac{1}{2}(n^2 - n) = \frac{1}{2}n(n + 1)$$

(ii) Let A^{ij} be a skew-symmetric tensor of order two so that $A^{ij} = -A^{ji}$. As above, A^{ij} will have n^2 components. Out of these, n components $A^{11}, A^{22}, \dots, A^{nn}$ are all zero. [$\because A^{11} = -A^{11}$].

Omitting these, there are $(n^2 - n)$ components. Since $A^{12} = -A^{21}, A^{13} = -A^{31}$ etc., therefore ignoring the sign, $(n^2 - n)$ components can be taken in pairs.

Hence the total number of independent non-zero components

$$= \frac{1}{2}(n^2 - n) = \frac{1}{2}n(n - 1).$$

PROBLEMS 38.1

1. Write the following using the summation convention :

$$(i) \frac{d\phi}{dt} = \frac{\partial \phi}{\partial x^1} \frac{dx^1}{dt} + \frac{\partial \phi}{\partial x^2} \frac{dx^2}{dt} + \dots + \frac{\partial \phi}{\partial x^n} \frac{dx^n}{dt} \quad (ii) (x^1)^2 + (x^2)^2 + (x^3)^2 + \dots + (x^n)^2.$$

2. Write out in full the following :

$$(i) a_{ij} x^i x^j \quad (i, j = 1, 2, 3) \quad (ii) g_{ij} dx^i dx^j \quad (i, j = 1, 2, 3)$$

$$(iii) g_{lm} g^{mp}$$

3. (a) Shows that δ^i_j is an invariant.

(Bhopal, 2003)

(b) Evaluate (i) $\delta_j^i \delta^j_k$

(ii) $\delta^p_q \delta^q_r \delta^r_s$

4. Show that (i) $\frac{\partial \bar{x}^j}{\partial x^i} = \delta^j_i$

$$(ii) \frac{\partial \bar{x}^P}{\partial \bar{x}^q} \frac{\partial \bar{x}^q}{\partial x^r} = \delta^P_r$$

5. If the \bar{x} 's are n independent functions of x 's and i, j, k, l each take values from 1 to n , show that

$$\frac{\partial \bar{x}^i}{\partial x^k} \frac{\partial \bar{x}^j}{\partial x^l} \cdot \delta^k_l = \delta^i_j.$$

6. Write down the law of transformation for the tensors

$$(i) A_i^k$$

$$(ii) C_{mn}.$$

7. A quantity $A(i, j, k, l, m)$ which is a function of the coordinates x^p transforms to another coordinate system \bar{x}^p according to the law :

$$\bar{A}(r, s, t, u, v) = \frac{\partial \bar{x}^r}{\partial x^i} \frac{\partial \bar{x}^s}{\partial x^j} \frac{\partial \bar{x}^t}{\partial x^k} \frac{\partial \bar{x}^u}{\partial x^l} \frac{\partial \bar{x}^v}{\partial x^m} A(i, j, k, l, m)$$

Is this quantity a tensor ? If so express it suitably and state its nature and rank ?

8. If the components of two tensors are equal in one coordinate system, show that they are equal in all coordinate systems.

9. A covariant tensor has components $2x - z, x^2y, yz$ in cartesian coordinate system. Find its components in (a) cylindrical coordinates (Punjab, M.E., 1989) (b) spherical coordinates.

10. If g_{ij} denotes the components of a covariant tensor of rank two, show that the product $g_{ij} dx^i dx^j$ is an invariant scalar. (Delhi, 2002)

11. A contravariant tensor has components a, b, c in rectangular coordinates ; find the components in spherical coordinates.

12. Prove that $A_{ij}B^iC^j$ is an invariant, if B^i and C^j are contravariant vectors and A_{ij} is a covariant tensor. (Madras, M.E., 2000)

13. Show that $\partial A_p / \partial x^q$ is not a tensor even though A_p is a covariant tensor of rank one. (Bhopal, 2003)

14. If a tensor A^{pqr}_{skew} is a skew-symmetric with respect to the indices p and q in one coordinate system, show that it remains skew-symmetric with respect to p and q in any coordinate system.

38.8 ADDITION OF TENSORS

The sum (or difference) of two tensors of the same order and type is another tensor of the same order and type.

Let A_{ij} and B_{ij} be two tensors of the same order and same type. Their components in the coordinates system $\bar{x}^1, \bar{x}^2, \dots, \bar{x}^n$ are \bar{A}_{ij} and \bar{B}_{ij} such that

$$\bar{A}_{ij} = \frac{\partial x^k}{\partial \bar{x}^i} \frac{\partial x^l}{\partial \bar{x}^j} A_{kl} \quad \text{and} \quad \bar{B}_{ij} = \frac{\partial x^k}{\partial \bar{x}^i} \frac{\partial x^l}{\partial \bar{x}^j} B_{kl}$$

$$\therefore \bar{A}_{ij} \pm \bar{B}_{ij} = \frac{\partial x^k}{\partial \bar{x}^i} \frac{\partial x^l}{\partial \bar{x}^j} (A_{kl} \pm B_{kl}) \quad \text{i.e.,} \quad \bar{C}_{ij} = \frac{\partial x^k}{\partial \bar{x}^i} \frac{\partial x^l}{\partial \bar{x}^j} C_{kl}$$

Thus C_{ij} transforms in exactly the same manner as A_{ij} and B_{ij} and is, therefore, a tensor of the same order and same type.

38.9 OUTER PRODUCT OF TWO TENSORS

If A^i_j is a contravariant tensor of order two and B_{kl} is a covariant tensor of order two then their product is a mixed tensor C^i_{kl} of order four such that

$$C^i_{kl} = \bar{A}^i_j \bar{B}_{kl} = \left(\frac{\partial \bar{x}^i}{\partial x^p} \frac{\partial \bar{x}^j}{\partial x^q} A^{pq} \right) \left(\frac{\partial x^r}{\partial \bar{x}^k} \frac{\partial x^s}{\partial \bar{x}^l} B_{rs} \right) = \frac{\partial \bar{x}^i}{\partial x^p} \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial x^r}{\partial \bar{x}^k} \frac{\partial x^s}{\partial \bar{x}^l} A^{pq} B_{rs} = \frac{\partial \bar{x}^i}{\partial x^p} \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial x^s}{\partial \bar{x}^k} \frac{\partial x^r}{\partial \bar{x}^l} C_{rs}^{pq}$$

But this is the law of transformation of a mixed tensor of order four. Therefore, C^i_{kl} is a mixed tensor of order four. Such products are called *outer products of two tensors*.

38.10 CONTRACTION OF A TENSOR

Consider a mixed tensor A_i^{jk} of order four. By the law of transformation, we have

$$\bar{A}_i^{jk} = \frac{\partial \bar{x}^i}{\partial x^p} \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial \bar{x}^k}{\partial x^r} \frac{\partial x^s}{\partial \bar{x}^l} A_{ps}^{qr}$$

In this, put the covariant index $l = a$ contravariant index i , so that

$$\begin{aligned}\bar{A}_l^{ijk} &= \frac{\partial \bar{x}^i}{\partial x^p} \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial \bar{x}^k}{\partial x^r} A_s^{pqr} = \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial \bar{x}^k}{\partial x^r} \frac{\partial x^s}{\partial x^p} A_s^{pqr} \\ &= \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial \bar{x}^k}{\partial x^r} \delta_p^s A_s^{pqr} = \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial \bar{x}^k}{\partial x^r} A_p^{pqr}\end{aligned}$$

This shows that A_l^{ijk} is a contravariant tensor of order two.

The process of getting a tensor of lower order (reduced by 2) by putting a covariant index equal to a contravariant index and performing the summation indicated is known as **contraction**.

The tensors A_l^{ijk} and A_j^{ijk} obtained from contraction of the same tensor A_l^{ijk} are generally different from each other unless the tensor A_l^{ijk} is symmetric with respect to i and j (i.e., $A_j^{ijk} = A_i^{ijk}$).

38.11 INNER PRODUCT OF TWO TENSORS

Given the tensors A_k^i and B_{qr}^p , if we first form their outer product $A_k^i B_{qr}^p$ and contract this by putting $p = k$, then the result is $A_k^i B_{qr}^k$ which is also a tensor, called the *inner product of the given tensors*.

Hence the inner product of two tensors is obtained by first taking their outer product and then by contracting it. We can get several inner products for the same two tensors by contracting in different ways.

Example 38.10. Show that any inner product of the tensors A_r^p and B_t^{qs} is a tensor of rank three.

Solution. The transformation laws for A_r^p and B_t^{qs} are

$$\bar{A}_r^p = \frac{\partial \bar{x}^p}{\partial x^i} \frac{\partial x^k}{\partial \bar{x}^r} A_k^i \quad \dots(i) \quad \text{and} \quad \bar{B}_{t}^{qs} = \frac{\partial \bar{x}^q}{\partial x^j} \frac{\partial \bar{x}^s}{\partial x^l} \frac{\partial x^m}{\partial \bar{x}^t} B_m^l \quad \dots(ii)$$

∴ Inner product of \bar{A}_q^p and \bar{B}_t^{qs} is

$$\begin{aligned}\bar{A}_q^p \bar{B}_t^{qs} &= \left(\frac{\partial \bar{x}^p}{\partial x^i} \frac{\partial x^k}{\partial \bar{x}^q} \right) \left(\frac{\partial \bar{x}^q}{\partial x^j} \frac{\partial \bar{x}^s}{\partial x^l} \frac{\partial x^m}{\partial \bar{x}^t} \right) A_k^i B_m^l \\ &= \frac{\partial \bar{x}^p}{\partial x^i} \frac{\partial \bar{x}^s}{\partial x^l} \frac{\partial x^m}{\partial \bar{x}^t} \delta_j^k A_k^i B_m^l \\ &= \frac{\partial \bar{x}^p}{\partial x^i} \frac{\partial \bar{x}^s}{\partial x^l} \frac{\partial x^m}{\partial \bar{x}^t} A_j^i B_m^l \quad \therefore \frac{\partial x^k}{\partial \bar{x}^q} \frac{\partial x^j}{\partial \bar{x}^l} = \frac{\partial x^k}{\partial \bar{x}^l} = \delta_j^k\end{aligned}$$

Hence the inner product of \bar{A}_q^p and \bar{B}_t^{qs} is a tensor of rank 3.

Similarly putting $p = t$ in the product of (i) and (ii) and noting that

$$\frac{\partial \bar{x}^p}{\partial x^i} \frac{\partial x^m}{\partial \bar{x}^p} = \frac{\partial x^m}{\partial x^i} = \delta^m_i,$$

$A_r^p B_p^{qs}$ is found to be a tensor of rank 3.

Similarly, $A_r^p B_t^{qs}$ can also be shown to be a tensor of rank 3.

38.12 QUOTIENT LAW

To ascertain that a set of given functions forms the components of a tensor, we have to verify if the functions obey the tensor transformation laws. But this is a very tedious job. A simple test is provided by the quotient law which states that if the inner product of a set of functions with an arbitrary tensor is a tensor, then these set of functions are the components of a tensor.

The proof of this law is given below for a particular case.

Example 38.11. Show that the expression $A(i, j, k)$ is a tensor if its inner product with an arbitrary tensor B_k^l is a tensor.

Solution. Let $A(i, j, k) B_k^l = C_i^l$... (i)

where C_i^l is a tensor. In the coordinate system \bar{x}^i , let (i) transform to

$$\bar{A}(p, q, r) \bar{B}_r^q = \bar{C}_p^q \quad \dots (ii)$$

where \bar{B}_r^q and \bar{C}_p^q are the components of the tensors B_k^l and C_i^l . Expressing B_r^q in terms of \bar{B}_k^l and \bar{C}_p^q in terms of \bar{C}_i^l , (ii) takes the form

$$\bar{A}(p, q, r) \frac{\partial \bar{x}^q}{\partial x^l} \frac{\partial \bar{x}^s}{\partial x^l} \frac{\partial \bar{x}^k}{\partial x^r} B_k^l = \frac{\partial \bar{x}^q}{\partial x^l} \frac{\partial \bar{x}^s}{\partial x^p} C_i^l \quad \dots (iii)$$

Multiplying (i) by $\frac{\partial \bar{x}^s}{\partial x^l} \frac{\partial \bar{x}^k}{\partial x^p}$ and subtracting from (iii), we get

$$\left\{ \bar{A}(p, q, r) \frac{\partial \bar{x}^q}{\partial x^l} \frac{\partial \bar{x}^s}{\partial x^l} \frac{\partial \bar{x}^k}{\partial x^r} - A(i, j, k) \frac{\partial \bar{x}^q}{\partial x^l} \frac{\partial \bar{x}^s}{\partial x^p} \right\} B_k^l = 0$$

Now B_k^l being an arbitrary tensor, the quantity within the brackets must be identically zero, i.e.,

$$\bar{A}(p, q, r) \frac{\partial \bar{x}^q}{\partial x^l} \frac{\partial \bar{x}^s}{\partial x^l} \frac{\partial \bar{x}^k}{\partial x^r} = A(i, j, k) \frac{\partial \bar{x}^q}{\partial x^l} \frac{\partial \bar{x}^s}{\partial x^p}$$

$$\text{or } \bar{A}(p, q, r) = \frac{\partial \bar{x}^l}{\partial x^p} \frac{\partial \bar{x}^j}{\partial x^q} \frac{\partial \bar{x}^r}{\partial x^k} = A(i, j, k)$$

But this is the law of tensor transformation. Hence $A(i, j, k)$ is a tensor of order three, with i, j as covariant indices and k as contravariant index.

PROBLEMS 38.2

- Prove that if a tensor equation is true for one coordinate system, it is true for all coordinate systems.
- Show that every tensor can be expressed as the sum of two tensors, one of which is symmetric and the other skew-symmetric.
- If A^{pq} , and B^{pq} , are tensors, prove that their sum and differences are also tensors.
- Show that A_{ij} is a tensor if its inner product with an arbitrary mixed tensor B_j^i is a tensor.
- Prove that (a) the contraction of the tensor $A^p{}_q$ is an invariant.
(b) the contraction of the outer product of the tensors A^p and B_q is also an invariant.
- Let A^{pq}_{rst} be a tensor; choose $p=t$ and $q=s$ and show that A^{pq}_{rst} is also a tensor. What is its rank?

38.13 (1) RIEMANNIAN SPACE

The distance ds between two adjacent points whose rectangular Cartesian coordinates are (x, y, z) and $(x+dx, y+dy, z+dz)$ is given by $ds^2 = dx^2 + dy^2 + dz^2$.

Riemann extended the concept of distance to a space of n dimensions and defined the distance ds between two adjacent points x^i and $x^i + dx^i$ ($i = 1, 2, \dots, n$) by the relation

$$ds^2 = a_{11}(dx^1)^2 + a_{22}(dx^2)^2 + \dots + a_{nn}(dx^n)^2 + a_{12}dx^1dx^2 + \dots + a_{lm}dx^l dx^m + \dots \\ = a_{ij}dx^i dx^j, \text{ using summation convention.} \quad \dots (1)$$

The coefficients a_{ij} are the functions of the coordinates x^i . The quadratic form (1) is called a Riemannian metric and any space in which the distance is given by such a metric is called a *Riemannian space*.*

If in a particular coordinate system X^i , the quadratic form (1) reduces to the form

$$ds^2 = (dX^1)^2 + (dX^2)^2 + \dots + (dX^n)^2,$$

then it is called a Euclidean metric and the corresponding space is called the *Euclidean space*.

* See footnote on p. 673

Obs. The geometry based on the Riemannian metric is called the *Riemannian geometry* and that based on the Euclidean metric is called the *Euclidean geometry*.

(2) Metric tensor. As in the physical space, the distance ds in the n -dimensional space is assumed to be independent of the coordinate system, i.e. a scalar invariant or a tensor of order zero. In the relation (1), dx^i and dx^j being displacements are components of a contravariant vector or a tensor of order one. Therefore, their outer product $dx^i dx^j$ is a contravariant tensor of order two. By the quotient law, the functions a_{ij} must be components of a covariant tensor of order two.

Let us write $a_{ij} = g_{ij} + h_{ij}$ where $g_{ij} = \frac{1}{2}(a_{ij} + a_{ji})$ and $h_{ij} = \frac{1}{2}(a_{ij} - a_{ji})$.

Interchanging i and j , we have $g_{ji} = \frac{1}{2}(a_{ji} + a_{ij}) = g_{ij}$ and $h_{ji} = \frac{1}{2}(a_{ji} - a_{ij}) = -h_{ij}$

$\therefore g_{ij}$ is symmetric and h_{ij} is skew-symmetric. Thus (1) take the form

$$ds^2 = a_{ij} dx^i dx^j = (g_{ij} + h_{ij}) dx^i dx^j$$

Now $h_{ij} dx^i dx^j$ is zero, since h_{ij} is skew-symmetric. Hence $ds^2 = g_{ij} dx^i dx^j$ where g_{ij} is a covariant symmetric tensor of order two. It is called the *metric tensor* or the *first fundamental tensor*.

38.14 CONJUGATE TENSOR

Let g be the determinant $|g_{ij}|$ and G_{ij} denote the cofactors of g_{ij} in g . Define the function of g^{ij} by the relation $g^{ij} = G_{ij}/g$... (1)

Since the functions g_{ij} and G_{ij} are symmetric in the subscripts, the functions g^{ij} will be symmetric in the superscripts. Now

$$\begin{aligned} g_{ij} g^{lj} &= g_{ij} \frac{G_{lj}}{g} = \frac{g}{g} = 1 \quad \text{and} \quad g_{ij} g^{lj} = g_{ij} \frac{G_{lj}}{g} \\ &= 1, \text{ if } l = i, = 0, \text{ if } l \neq i \end{aligned}$$

Thus $g_{ij} g^{lj} = \delta_i^l$... (2)

If u^j be an arbitrary contravariant tensor, then its inner product with the tensor g_{ij} will be an arbitrary covariant tensor due to contraction, i.e.,

$$\begin{aligned} g_{ij} u^j &= v_i \\ \therefore g^{ij} v_i &= g^{ij} g_{ij} u^j = u^j, \end{aligned} \quad \dots(3)$$

which is a contravariant tensor of order one. Therefore by quotient law, g^{ij} are the components of a contravariant tensor of order two. Hence g^{ij} is a symmetric contravariant tensor which is called the *conjugate tensor* or the *second fundamental tensor*.

Obs. In view of (2), the relation between g_{ij} and g^{ij} is reciprocal. As such the *first and second fundamental tensors are also called reciprocal tensors*.

Example 38.12. Find the components of the first and second fundamental tensors in spherical coordinates.

Solution. Let (x^1, x^2, x^3) be the rectangular cartesian coordinates and $\bar{x}^1, \bar{x}^2, \bar{x}^3$ be the spherical coordinates of a point so that

$$x^1 = r \sin \theta \cos \phi, x^2 = r \sin \theta \sin \phi, x^3 = r \cos \theta \quad \dots(i)$$

and

We know that $x = r \sin \theta \cos \phi, y = r \sin \theta \sin \phi, z = r \cos \theta$... (ii)

Let g_{pq} and \bar{g}_{ij} be the metric tensors in cartesian and spherical coordinates respectively.

Then $ds^2 = (dx^1)^2 + (dx^2)^2 + (dx^3)^2 = g_{pq} dx^p dx^q$

$\therefore g_{11} = 1 = g_{22} = g_{33}, \text{ and } g_{12} = 0 = g_{13} = g_{23} \text{ etc.}$... (iii)

On transformation

$$\bar{g}_{ij} = \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} g_{pq} = \frac{\partial x^1}{\partial \bar{x}^i} \frac{\partial x^1}{\partial \bar{x}^j} g_{11} + \frac{\partial x^2}{\partial \bar{x}^i} \frac{\partial x^2}{\partial \bar{x}^j} g_{22} + \frac{\partial x^3}{\partial \bar{x}^i} \frac{\partial x^3}{\partial \bar{x}^j} g_{33} \quad \dots(iv)$$

Putting $i = j = 1$ in (iv), we have

$$\begin{aligned}\bar{g}_{11} &= \left(\frac{\partial x^1}{\partial \bar{x}^1} \right)^2 g_{11} + \left(\frac{\partial x^2}{\partial \bar{x}^1} \right)^2 g_{22} + \left(\frac{\partial x^3}{\partial \bar{x}^1} \right)^2 g_{33} \\ &= \left(\frac{\partial x}{\partial r} \right)^2 + \left(\frac{\partial y}{\partial r} \right)^2 + \left(\frac{\partial z}{\partial r} \right)^2 \quad [\text{By (i) and (iii)}] \\ &= (\sin \theta \cos \phi)^2 + (\sin \theta \sin \phi)^2 + (\cos \theta)^2 = \sin^2 \theta + \cos^2 \theta = 1. \quad [\text{By (ii)}]\end{aligned}$$

Putting $i = j = 2$ in (iv), we have

$$\begin{aligned}\bar{g}_{22} &= \left(\frac{\partial x^1}{\partial \bar{x}^2} \right)^2 g_{11} + \left(\frac{\partial x^2}{\partial \bar{x}^2} \right)^2 g_{22} + \left(\frac{\partial x^3}{\partial \bar{x}^2} \right)^2 g_{33} \\ &= \left(\frac{\partial x}{\partial \theta} \right)^2 + \left(\frac{\partial y}{\partial \theta} \right)^2 + \left(\frac{\partial z}{\partial \theta} \right)^2 \quad [\text{By (i) and (iii)}] \\ &= (r \cos \theta \cos \phi)^2 + (r \cos \theta \sin \phi)^2 + (-r \sin \theta)^2 = r^2 \cos^2 \theta + r^2 \sin^2 \theta = r^2\end{aligned}$$

Similarly $\bar{g}_{33} = \left(\frac{\partial x^1}{\partial \bar{x}^3} \right)^2 g_{11} + \left(\frac{\partial x^2}{\partial \bar{x}^3} \right)^2 g_{22} + \left(\frac{\partial x^3}{\partial \bar{x}^3} \right)^2 g_{33} = r^2 \sin^2 \theta$

and

$$\bar{g}_{12} = 0 = \bar{g}_{13} = \bar{g}_{21} = \bar{g}_{23} = \bar{g}_{31} = \bar{g}_{32}$$

Hence the first fundamental tensor, written in matrix form, is

$$g = \begin{bmatrix} 1 & 0 & 0 \\ 0 & r^2 & 0 \\ 0 & 0 & r^2 \sin^2 \theta \end{bmatrix} = r^4 \sin^2 \theta$$

and the cofactors in g are given by

$$G_{11} = r^4 \sin^2 \theta, G_{22} = r^2 \sin^2 \theta, G_{33} = r^2; G_{12} = 0 = G_{13} = G_{21} = G_{23} = G_{31} = G_{32}$$

The components of the second fundamental tensor are given by $g^{ij} = G_{ij}/g$. Hence the second fundamental

tensor in matrix form, is $\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1/r^2 & 0 \\ 0 & 0 & 1/r^2 \sin^2 \theta \end{bmatrix}$.

Example 38.13. Find the components of the metric tensor and the conjugate tensor in cylindrical coordinates.

Solution. Let (x^1, x^2, x^3) be the cartesian coordinates and $(\bar{x}^1, \bar{x}^2, \bar{x}^3)$ be the cylindrical coordinates of a point so that

$$x^1 = x, x^2 = y, x^3 = z \quad \text{and} \quad \bar{x}^1 = \rho, \bar{x}^2 = \phi, \bar{x}^3 = z \quad \dots(i)$$

We know that

$$x = \rho \cos \phi, y = \rho \sin \phi, z = z \quad \dots(ii)$$

Let g_{pq} and \bar{g}_{ij} be the metric tensors in cartesian and cylindrical coordinates respectively.

Then $ds^2 = (dx^1)^2 + (dx^2)^2 + (dx^3)^2 = g_{pq} dx^p$

$$\therefore g_{11} = 1 = g_{22} = g_{33} \quad \text{and} \quad g_{12} = 0 = g_{13} = g_{23} \text{ etc.} \quad \dots(iii)$$

On transformation,

$$\bar{g}_{ij} = \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} g_{pq} = \frac{\partial x^1}{\partial \bar{x}^i} \frac{\partial x^1}{\partial \bar{x}^j} g_{11} + \frac{\partial x^2}{\partial \bar{x}^i} \frac{\partial x^2}{\partial \bar{x}^j} g_{22} + \frac{\partial x^3}{\partial \bar{x}^i} \frac{\partial x^3}{\partial \bar{x}^j} g_{33} \quad \dots(iv)$$

Putting $i = j = 1$ in (iv), we have

$$\bar{g}_{11} = \left(\frac{\partial x^1}{\partial \bar{x}^1} \right)^2 g_{11} + \left(\frac{\partial x^2}{\partial \bar{x}^1} \right)^2 g_{22} + \left(\frac{\partial x^3}{\partial \bar{x}^1} \right)^2 g_{33} = \left(\frac{\partial x}{\partial p} \right)^2 + \left(\frac{\partial y}{\partial p} \right)^2 + \left(\frac{\partial z}{\partial p} \right)^2 \\ = \cos^2 \phi + \sin^2 \phi + 0 = 1$$

[By (i) and (ii)]

Putting $i = j = 2$ in (iv), we have

$$\bar{g}_{22} = \left(\frac{\partial x^1}{\partial \bar{x}^2} \right)^2 g_{11} + \left(\frac{\partial x^2}{\partial \bar{x}^2} \right)^2 g_{22} + \left(\frac{\partial x^3}{\partial \bar{x}^2} \right)^2 g_{33} = \left(\frac{\partial x}{\partial \phi} \right)^2 + \left(\frac{\partial y}{\partial \phi} \right)^2 + \left(\frac{\partial z}{\partial \phi} \right)^2 \\ = (-\rho \sin \phi)^2 + (\rho \cos \phi)^2 + 0 = \rho^2$$

[By (i) and (ii)]

Similarly $\bar{g}_{33} = \left(\frac{\partial x^1}{\partial \bar{x}^3} \right)^2 g_{11} + \left(\frac{\partial x^2}{\partial \bar{x}^3} \right)^2 g_{22} + \left(\frac{\partial x^3}{\partial \bar{x}^3} \right)^2 g_{33} = 0 + 0 + 1 = 1$

and

$$\bar{g}_{12} = 0 = \bar{g}_{13} = \bar{g}_{21} = \bar{g}_{23} = \bar{g}_{31} = \bar{g}_{32}$$

Hence the metric tensor, written in matrix form, is

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & \rho^2 & 0 \\ 0 & 0 & 1 \end{bmatrix} \quad \therefore \quad g = \begin{bmatrix} 1 & 0 & 0 \\ 0 & \rho^2 & 0 \\ 0 & 0 & 1 \end{bmatrix} = \rho^2$$

Also cofactors in g are given by

$$G_{11} = \rho^2, G_{22} = 1, G_{33} = \rho^2; G_{12} = 0 = G_{13} = G_{21} = G_{23} = G_{31} = G_{32}$$

The components of the conjugate tensor are given by $g^{ij} = G_{ij}/g$.

Hence the conjugate tensor in matrix form is

$$\begin{bmatrix} 1 & 0 & 0 \\ 0 & 1/\rho^2 & 0 \\ 0 & 0 & 1 \end{bmatrix}$$

38.15 ASSOCIATED TENSORS

From (3) of § 38.14, we have $\omega^i \cdot g_{ij} = v_i$... (1)

i.e., the inner product of the tensor ω^i with the fundamental tensor g_{ij} is another tensor v_i which is called the associated tensor of ω^i .

Similarly, we have $v_i \cdot g^{ij} = u^j$... (2)

Hence u^j is the associated tensor of v_i .

Thus the indices of any tensor can be lowered or raised by forming its inner product with either of the fundamental tensors g_{ij} or g^{ij} as in (1) or (2) above.

38.16 (1) LENGTH OF A VECTOR

The vector \mathbf{A} is given by

$$\mathbf{A} = A^i g_i \quad \text{or} \quad \mathbf{A} = A_i g^i \quad \dots (1)$$

Also we have the associated vectors $A_i = g_{ij} A^j$... (2)

$$A^i = g^{ij} A_j \quad \dots (3)$$

or
∴ Length of vector $\mathbf{A} = (\mathbf{A} \cdot \mathbf{A})^{1/2} = (A^i g_i \cdot A_j g^j)^{1/2}$ [By (1)]

$$= (g_{ij} A^i A^j)^{1/2} \quad \therefore g_i \cdot g_j = g_{ij}$$

$$= (A_i A^i)^{1/2} \quad \text{[By (2)]}$$

$$\text{Also length of vector } \mathbf{A} = (\mathbf{A} \cdot \mathbf{A})^{1/2} = (A_i g^i \cdot A_j g^j)^{1/2} = (g^{ij} A_i A_j)^{1/2} = (A_i A^i)^{1/2} \quad \text{[By (3)]}$$

$$\text{Hence the magnitude or length of the vector } A = \sqrt{(g_{ij} A^i A^j)} = \sqrt{(g^{ij} A_i A_j)} = \sqrt{(A_i A^i)} \quad \dots (4)$$

which is an invariant.

Obs. The length of a vector $A^1, 0, 0$ (in 3-dimensions) is $\sqrt{g_{11}A^1A^1}$, i.e. $\sqrt{g_{11}}$. Similarly the length of the vector $0, A^2, 0$ is $\sqrt{g_{22}A^2}$ and the length of the vector $0, 0, A^3$ is $\sqrt{g_{33}A^3}$. Hence the physical components of a vector A^i are $\sqrt{g_{11}A^1}, \sqrt{g_{22}A^2}, \sqrt{g_{33}A^3}$.

(2) Angle between two vectors. Let \mathbf{A} and \mathbf{B} be the given vectors such that

$$\mathbf{A} = A^i g_i \text{ and } \mathbf{B} = B^j g_j \quad \dots(5)$$

$$\therefore \mathbf{A} \cdot \mathbf{B} = |\mathbf{A}| |\mathbf{B}| \cos \theta$$

or

$$\cos \theta = \frac{\mathbf{A} \cdot \mathbf{B}}{|\mathbf{A}| |\mathbf{B}|} = \frac{A^i B^j g_{ij}}{\sqrt{(g_{ij} A^i A^j)} \sqrt{(g_{ij} B^i B^j)}} \quad [\text{Using (4) and (5)}]$$

In terms of associated vectors, we have

$$\cos \theta = \frac{A^i B_i}{\sqrt{(A^i A_i)} \sqrt{(B^i B_i)}}.$$

PROBLEMS 38.3

- If $ds^2 = 5(dx^1)^2 + 3(dx^2)^2 + 4(x^3)^2 - 6dx^1 dx^2 + 4dx^2 dx^3$, find the values of g_{ij} and g^{ij} .
- Find g and g^{ij} corresponding to the metric $ds^2 = \frac{dr^2}{1-r^2/a^2} + r^2(d\theta^2 + \sin^2 \theta d\phi^2)$.
- The contravariant components of a vector \mathbf{A} in plane cartesian coordinates $x = x^1, y = x^2$ are (33, 56). Using the tensor law of transformation, obtain the new components in polar coordinates $r = \bar{x}^1$ and $\theta = \bar{x}^2$.
- Prove that the angles θ_{12}, θ_{23} and θ_{31} between the coordinate curves in a 3-dimensional coordinate system are given by $\cos \theta_{12} = \frac{g_{12}}{\sqrt{(g_{11}g_{22})}}, \cos \theta_{23} = \frac{g_{23}}{\sqrt{(g_{22}g_{33})}}, \cos \theta_{31} = \frac{g_{31}}{\sqrt{(g_{33}g_{11})}}$.
- Prove that for an orthogonal coordinate system
 - (i) $g_{12} = g_{23} = g_{31} = 0$
 - (ii) $g^{11} = 1/g_{11}, g_{22} = 1/g^{22}, g_{33} = 1/g^{33}$.

38.17 CHRISTOFFEL SYMBOLS

Christoffel symbol of the first kind is denoted by $[ij, k]$ and is defined by

$$[ij, k] = \frac{1}{2} \left(\frac{\partial g_{jk}}{\partial x^i} + \frac{\partial g_{ik}}{\partial x^j} - \frac{\partial g_{ij}}{\partial x^k} \right) \quad \dots(1)$$

where g_{ij} are the components of the metric tensor.

Christoffel symbol of the second kind is denoted by $\begin{Bmatrix} k \\ ij \end{Bmatrix}$ and is defined by

$$\begin{Bmatrix} k \\ ij \end{Bmatrix} = g^{kl} [ij, l] \quad \dots(2)$$

Some authors write Christoffel symbol of the second kind as $\{ij, k\}$ or Γ_{ij}^k .

Obs. 1. No summation is indicated in the Christoffel symbol of the first kind, but summation is to be made over l in the Christoffel symbol of the second kind.

Obs. 2. It is evident from (1) and (2) that the Christoffel symbols of both kinds are symmetric in the indices i and j .

$$[ij, k] = [ji, k] \text{ and } \begin{Bmatrix} k \\ ij \end{Bmatrix} = \begin{Bmatrix} k \\ ji \end{Bmatrix}.$$

Example 38.14. If $(ds)^2 = (dr)^2 + r^2(d\theta)^2 + r^2 \sin^2 \theta (d\phi)^2$, find the values of

(a) $[22, 1]$ and $[13, 3]$

(b) $\begin{Bmatrix} 1 \\ 22 \end{Bmatrix}$ and $\begin{Bmatrix} 3 \\ 13 \end{Bmatrix}$.

Solution. It is a 3-dimensional space in spherical coordinates such that

$$x^1 = r, x^2 = \theta, x^3 = \phi$$

Clearly

$$g_{11} = 1, g_{22} = r^2, g_{33} = r^2 \sin^2 \theta \text{ and } g_{ij} = 0 \text{ for } i \neq j. \quad \dots(i)$$

Also $g^{11} = 1, g^{22} = 1/r^2, g^{33} = 1/r^2 \sin^2 \theta$

(See Ex. 38.12) $\dots(ii)$

(a) Christoffel symbols of the first kind are given by

$$\{ij, k\} = \frac{1}{2} \left[\frac{\partial g_{jk}}{\partial x^i} + \frac{\partial g_{ik}}{\partial x^j} - \frac{\partial g_{ij}}{\partial x^k} \right]_{i, j, k=1, 2, 3} \quad \dots(iii)$$

Taking $i = 2, j = 2$, and $k = 1$ in (iii), we get

$$\{22, 1\} = \frac{1}{2} \left[\frac{\partial g_{21}}{\partial x^2} + \frac{\partial g_{21}}{\partial x^2} - \frac{\partial g_{22}}{\partial x^1} \right] = \frac{1}{2} \left[\frac{\partial(0)}{\partial \theta} + \frac{\partial(0)}{\partial \theta} - \frac{\partial(r^2)}{\partial r} \right] = -r \quad \dots(iv)$$

Putting $i = 1, j = 3$ and $k = 3$ in (iii), we obtain

$$\{13, 3\} = \frac{1}{2} \left[\frac{\partial g_{33}}{\partial x^1} + \frac{\partial g_{13}}{\partial x^3} - \frac{\partial g_{13}}{\partial x^3} \right] = \frac{1}{2} \left[\frac{\partial(r^2 \sin^2 \theta)}{\partial r} + \frac{\partial(0)}{\partial \phi} - \frac{\partial(0)}{\partial \phi} \right] = r \sin^2 \theta \quad \dots(v)$$

(b) Christoffel symbols of the second kind are defined by

$$\begin{Bmatrix} k \\ ij \end{Bmatrix} = g^{kl} \{ij, l\} = g^{k1} \{ij, 1\} + g^{k2} \{ij, 2\} + g^{k3} \{ij, 3\} \quad \dots(vi)$$

$$\begin{Bmatrix} 1 \\ 22 \end{Bmatrix} = g^{11} \{22, 1\} + g^{12} \{22, 2\} + g^{13} \{22, 3\} = \{22, 1\} + 0 \{22, 2\} + 0 \{22, 3\}$$

$$= -r \quad [\text{By (iv)}]$$

$$\begin{Bmatrix} 3 \\ 13 \end{Bmatrix} = g^{31} \{13, 1\} + g^{32} \{13, 2\} + g^{33} \{13, 3\}$$

$$= 0 \{13, 1\} + 0 \{13, 2\} + \frac{1}{r^2 \sin^2 \theta} \{13, 3\} \quad [\text{By (ii)}]$$

$$= \frac{1}{r^2 \sin^2 \theta} \cdot r \sin^2 \theta = \frac{1}{r}. \quad [\text{By (v)}]$$

Example 38.15. Prove that

$$(a) \frac{\partial g_{ij}}{\partial x^k} = \{ik, j\} + \{jk, i\} \quad (b) \frac{\partial g^{ij}}{\partial x^k} = -g^{il} \begin{Bmatrix} i \\ lk \end{Bmatrix} - g^{im} \begin{Bmatrix} j \\ mh \end{Bmatrix}.$$

Solution. (a) By definition of Christoffel symbol of the first kind, we have

$$\{ik, j\} = \frac{1}{2} \left[\frac{\partial g_{kj}}{\partial x^i} + \frac{\partial g_{ij}}{\partial x^k} - \frac{\partial g_{ik}}{\partial x^j} \right] \quad \dots(i)$$

and

$$\{jk, i\} = \frac{1}{2} \left[\frac{\partial g_{hi}}{\partial x^j} + \frac{\partial g_{ji}}{\partial x^k} - \frac{\partial g_{jk}}{\partial x^i} \right] \quad \dots(ii)$$

Since g_{ij} is a symmetric tensor, $\therefore g_{ij} = g_{ji}, g_{jk} = g_{kj}, g_{hi} = g_{ih}$

Adding (i) and (ii), we get the required result.

(b) We know that $g^{ij}g^{lj} = \delta_l^i$.

[Refer to § 38.14 (2)]

Differentiating w.r.t. x^k , we get

$$g^{ij} \frac{\partial g_{lj}}{\partial x^k} + g_{lj} \frac{\partial g^{ij}}{\partial x^k} = 0 \quad [\because \delta_l^i = 1 \text{ or } 0]$$

Multiplying by g^{lm} and transposing, we have

$$g^{lm} g_{lj} \frac{\partial g^{ij}}{\partial x^k} = -g^{lm} g^{ij} \frac{\partial g_{lj}}{\partial x^k} \quad \text{or} \quad \delta_j^m \frac{\partial g^{ij}}{\partial x^k} = -g^{lm} g^{ij} (\{lk, j\} + \{jk, l\}) \quad [\text{From (a)}]$$

or

$$\frac{\partial g^{im}}{\partial x^k} = -g^{lm}(g^{ij}[lk, j]) - g^{ij}(g^{jm}[jk, l]) = -g^{lm}\begin{Bmatrix} i \\ lk \end{Bmatrix} - g^{ij}\begin{Bmatrix} m \\ jk \end{Bmatrix}$$

Interchanging m and j , we obtain the desired result.

38.18 TRANSFORMATION OF CHRISTOFFEL SYMBOLS

The fundamental tensors g_{ij}, g^{ij} and also $[ij, k]$ are functions of the coordinates x^i . Let these transform to $\bar{g}_{ij}, \bar{g}^{ij}$ and $[\bar{i}, \bar{j}, \bar{k}]$ in another coordinate system \bar{x}^i .

(1) Law of transformation of Christoffel symbol of first kind.

Let $[ij, k]$ which is a function of x^i , transform to $[\bar{i}, \bar{j}, \bar{k}]$ in another coordinate system \bar{x}^i . Then

$$[\bar{i}, \bar{j}, \bar{k}] = \frac{1}{2} \left(\frac{\partial \bar{g}_{jk}}{\partial \bar{x}^i} + \frac{\partial \bar{g}_{ik}}{\partial \bar{x}^j} - \frac{\partial \bar{g}_{ij}}{\partial \bar{x}^k} \right) \quad \dots(1)$$

Since \bar{g}_{ij} is a covariant tensor of order two, we have

$$\bar{g}_{ij} = \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} g_{pq} \quad \dots(2)$$

Differentiating both sides w.r.t. \bar{x}^k , we get

$$\frac{\partial \bar{g}_{ij}}{\partial \bar{x}^k} = \left(\frac{\partial^2 x^p}{\partial \bar{x}^k \partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial^2 x^q}{\partial \bar{x}^k \partial \bar{x}^j} \right) g_{pq} + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} \frac{\partial \bar{g}_{pq}}{\partial \bar{x}^k} \frac{\partial x^r}{\partial \bar{x}^k} \quad \dots(3)$$

[Note that g_{pq} is in terms of original coordinates x and to differentiate it w.r.t. \bar{x}^k , first we differentiate it w.r.t. x^r and then differentiate x^r w.r.t. \bar{x}^k .]

Interchanging i, k and also p, r in the last term of (3), we have

$$\frac{\partial \bar{g}_{ik}}{\partial \bar{x}^i} = \left(\frac{\partial^2 x^p}{\partial \bar{x}^i \partial \bar{x}^k} \frac{\partial x^q}{\partial \bar{x}^j} + \frac{\partial x^p}{\partial \bar{x}^k} \frac{\partial^2 x^q}{\partial \bar{x}^i \partial \bar{x}^j} \right) g_{pq} + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial \bar{g}_{qr}}{\partial \bar{x}^k} \quad \dots(4)$$

Similarly interchanging j, k and also q, r in the last term of (3), we get

$$\frac{\partial \bar{g}_{ik}}{\partial \bar{x}^j} = \left(\frac{\partial^2 x^p}{\partial \bar{x}^j \partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^k} + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial^2 x^q}{\partial \bar{x}^j \partial \bar{x}^k} \right) g_{pq} + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^r}{\partial \bar{x}^k} \frac{\partial x^p}{\partial \bar{x}^j} \frac{\partial \bar{g}_{pr}}{\partial \bar{x}^k} \quad \dots(5)$$

Substituting the values from (3), (4) and (5) in (1), we obtain

$$[\bar{i}, \bar{j}, \bar{k}] = \frac{\partial^2 x^p}{\partial \bar{x}^i \partial \bar{x}^j} \frac{\partial x^q}{\partial \bar{x}^k} g_{pq} + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} \frac{\partial x^r}{\partial \bar{x}^k} [pq, r] \quad \dots(6)$$

This is the desired law of transformation of Christoffel symbol of the first kind.

(2) Law of transformation of Christoffel symbol of the second kind.

Let $g^{kl}[ij, l]$ transform to $\bar{g}^{kl}[\bar{i}, \bar{l}]$.

Since \bar{g}^{kl} is a contravariant tensor of order two.

$$\therefore \bar{g}^{kl} = \frac{\partial \bar{x}^k}{\partial x^s} \frac{\partial \bar{x}^l}{\partial x^t} g^{st} \quad \dots(7)$$

$$\text{From (6), we have } [\bar{i}, \bar{l}] = \frac{\partial^2 x^p}{\partial \bar{x}^i \partial \bar{x}^l} \frac{\partial x^q}{\partial \bar{x}^j} g_{pq} + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} \frac{\partial x^r}{\partial \bar{x}^l} [pq, r] \quad \dots(8)$$

Multiplying the respective sides of (7) and (8), we get

$$\begin{Bmatrix} \bar{l} \\ \bar{i} \end{Bmatrix} = \frac{\partial \bar{x}^t}{\partial x^s} \delta^q_s \frac{\partial^2 x^p}{\partial \bar{x}^i \partial \bar{x}^j} g^{st} g_{pq} + \frac{\partial \bar{x}^l}{\partial x^s} \delta^r_s \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} g^{st} [pq, r] \quad \dots(9)$$

Since $\delta^q_s g^{st} g_{pq} = g^{qt} g_{pq} = \delta_p^t$

and

$$\delta_s^r g^{st} [pq, r] = g^{rt} [pq, r] = \begin{Bmatrix} t \\ pq \end{Bmatrix}$$

$$\therefore \begin{Bmatrix} \bar{l} \\ \bar{u} \end{Bmatrix} = \frac{\partial^2 x^p}{\partial \bar{x}^i \partial \bar{x}^j} \delta^l_p \frac{\partial \bar{x}^l}{\partial x^t} + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} \frac{\partial \bar{x}^l}{\partial x^t} \begin{Bmatrix} t \\ pq \end{Bmatrix}$$

or

$$\begin{Bmatrix} \bar{l} \\ ij \end{Bmatrix} = \frac{\partial^2 x^p}{\partial \bar{x}^i \partial \bar{x}^j} \frac{\partial \bar{x}^l}{\partial x^t} + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} \frac{\partial \bar{x}^l}{\partial x^t} \begin{Bmatrix} t \\ pq \end{Bmatrix} \quad \dots(10)$$

This is the law of transformation of Christoffel symbol of the second kind.

Obs. 1. From (10), we obtain the following important relation :

$$\frac{\partial^2 x^i}{\partial \bar{x}^i \partial \bar{x}^j} = \frac{\partial x^i}{\partial \bar{x}^i} \begin{Bmatrix} \bar{l} \\ ij \end{Bmatrix} - \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial x^q}{\partial \bar{x}^j} \begin{Bmatrix} t \\ pq \end{Bmatrix} \quad \dots(11)$$

Obs. 2. It is evident from (6) and (10) that the Christoffel 3-index symbols are not tensors. These symbols transform like tensors only for linear transformation of coordinates.

Example 38.16. Prove that $\begin{Bmatrix} i \\ ij \end{Bmatrix} = \frac{\partial}{\partial x^i} (\log \sqrt{g})$.

Solution. Let G_{jk} be the co-factor of g_{ik} in g so that $g = g_{ik} G_{ik}$ (summation over k only)

$$\therefore \frac{\partial g}{\partial g_{ik}} = G_{ik} \quad [\because G_{ik} \text{ does not contain } g_{ik} \text{ implicitly}]$$

$$\text{Also} \quad \frac{\partial g}{\partial g^j} = \frac{\partial g}{\partial g_{ik}} \frac{\partial g_{ik}}{\partial x^j} = G_{ik} \frac{\partial g_{ik}}{\partial x^j} \quad (\text{summation over } i \text{ and } k) \quad (i)$$

$$\text{We know that} \quad g^{ik} = \frac{G_{ik}}{g} \quad \dots(ii)$$

Substituting the value of G_{ik} from (ii) in (i), we get

$$\frac{\partial g}{\partial x^j} = gg^{ik} \frac{\partial g_{ik}}{\partial x^j} \quad \text{or} \quad \frac{1}{g} \frac{\partial g}{\partial x^j} = g^{ik} \frac{\partial g_{ik}}{\partial x^j}$$

$$\text{or} \quad \frac{\partial}{\partial x^j} (\log g) = g^{ik} (jk, i] + [ij, k]) \quad [\text{By Ex. 38.15 (a)}]$$

$$= g^{ik} (jk, i] + g^{ik} [ji, k] = \begin{Bmatrix} k \\ jk \end{Bmatrix} + \begin{Bmatrix} i \\ ji \end{Bmatrix} = 2 \begin{Bmatrix} i \\ ji \end{Bmatrix}$$

$$\text{Hence} \quad \begin{Bmatrix} i \\ ij \end{Bmatrix} = \frac{1}{2} \frac{\partial}{\partial x^j} (\log g) = \frac{\partial}{\partial x^j} \log \sqrt{g}. \quad \dots(iii)$$

38.19 (1) COVARIANT DIFFERENTIATION OF A COVARIANT VECTOR

Let A_i and \bar{A}_i be the components of a covariant vector (i.e., a tensor of first order) in the coordinate system x^i and \bar{x}^i respectively. Let us investigate the tensor character of the partial derivatives of A_i w.r.t. the variables x^i . From the law of transformation, $\bar{A}_i = \frac{\partial x^p}{\partial \bar{x}^i} A_p$.

$$\text{Differentiating w.r.t. } \bar{x}^j, \text{ we have } \frac{\partial \bar{A}_i}{\partial \bar{x}^j} = \frac{\partial^2 x^p}{\partial \bar{x}^i \partial \bar{x}^j} A_p + \frac{\partial x^p}{\partial \bar{x}^i} \frac{\partial A_p}{\partial x^q} \frac{\partial x^q}{\partial \bar{x}^j} \quad \dots(1)$$

(Note that A_p is not directly a function of \bar{x}^j).

Due to presence of the first term on the R.H.S. of (1), it is evident that $\frac{\partial A_p}{\partial x^q}$ is not a tensor.

On replacing this term by $\frac{\partial^2 x^s}{\partial \bar{x}^i \partial \bar{x}^j} A_s$ and substituting for the second derivative from (11) of § 35.18, we get

$$\begin{aligned}\frac{\partial \bar{A}_l}{\partial \bar{x}^j} &= \frac{\partial x^s}{\partial \bar{x}^l} A_s \left\{ \begin{matrix} l \\ i \ j \end{matrix} \right\} - \frac{\partial x^p}{\partial \bar{x}^l} \frac{\partial x^q}{\partial \bar{x}^j} A_s \left\{ \begin{matrix} s \\ p \ q \end{matrix} \right\} + \frac{\partial x^p}{\partial \bar{x}^l} \frac{\partial x^q}{\partial \bar{x}^j} \frac{\partial A_p}{\partial \bar{x}^q} \\ \text{or } \frac{\partial \bar{A}_l}{\partial \bar{x}^j} - \bar{A}_l \left\{ \begin{matrix} l \\ i \ j \end{matrix} \right\} &= \frac{\partial x^p}{\partial \bar{x}^l} \frac{\partial x^q}{\partial \bar{x}^j} \left[\frac{\partial A_p}{\partial \bar{x}^q} - A_s \left\{ \begin{matrix} s \\ p \ q \end{matrix} \right\} \right]\end{aligned}$$

This shows that the expression $\frac{\partial \bar{A}_l}{\partial \bar{x}^j} - \bar{A}_l \left\{ \begin{matrix} l \\ i \ j \end{matrix} \right\}$

is a covariant tensor of the second order. This is called the covariant derivative of \bar{A}_l w.r.t. \bar{x}^j and is denoted by $\bar{A}_{l,j}$.

(2) Covariant differentiation of a contravariant vector. Let A^i and \bar{A}^i be the components of a contravariant vector in the coordinate systems x^i and \bar{x}^i . From the law of transformation $A^s = \frac{\partial x^s}{\partial \bar{x}^i} \bar{A}^i$.

Differentiating w.r.t. \bar{x}^j , we have $\frac{\partial A^s}{\partial \bar{x}^j} = \frac{\partial^2 x^s}{\partial \bar{x}^j \partial \bar{x}^i} \bar{A}^i + \frac{\partial x^s}{\partial \bar{x}^i} \frac{\partial \bar{A}^i}{\partial \bar{x}^j}$

Substituting for the second derivative from (11) of § 35.18, we get

$$\frac{\partial A^s}{\partial \bar{x}^q} \frac{\partial x^q}{\partial \bar{x}^j} = \frac{\partial x^s}{\partial \bar{x}^l} \left\{ \begin{matrix} l \\ i \ j \end{matrix} \right\} - \frac{\partial x^p}{\partial \bar{x}^l} \frac{\partial x^q}{\partial \bar{x}^j} \left\{ \begin{matrix} s \\ p \ q \end{matrix} \right\} \bar{A}^i + \frac{\partial x^s}{\partial \bar{x}^i} \frac{\partial \bar{A}^i}{\partial \bar{x}^j}$$

Interchanging the dummy indices i, l in the first term on the R.H.S. and putting

$$\frac{\partial x^p}{\partial \bar{x}^i} \bar{A}^i = A^p \text{ in the second term, we obtain}$$

$$\frac{\partial x^q}{\partial \bar{x}^j} \frac{\partial A^s}{\partial \bar{x}^q} = \frac{\partial x^s}{\partial \bar{x}^l} \left\{ \begin{matrix} l \\ i \ j \end{matrix} \right\} \bar{A}^i - \frac{\partial x^q}{\partial \bar{x}^j} A^p \left\{ \begin{matrix} s \\ p \ q \end{matrix} \right\} + \frac{\partial x^s}{\partial \bar{x}^i} \frac{\partial \bar{A}^i}{\partial \bar{x}^j}$$

Transposing the second term on the R.H.S. to the L.H.S., we get

$$\frac{\partial x^q}{\partial \bar{x}^j} \left[\frac{\partial A^s}{\partial \bar{x}^q} + A^p \left\{ \begin{matrix} s \\ p \ q \end{matrix} \right\} \right] = \frac{\partial x^s}{\partial \bar{x}^i} \left[\frac{\partial \bar{A}^i}{\partial \bar{x}^j} + \bar{A}^l \left\{ \begin{matrix} l \\ i \ j \end{matrix} \right\} \right]$$

$$\text{or } \frac{\partial \bar{A}^i}{\partial \bar{x}^j} + \bar{A}^l \left\{ \begin{matrix} l \\ i \ j \end{matrix} \right\} = \frac{\partial \bar{x}^i}{\partial x^s} \frac{\partial x^q}{\partial \bar{x}^j} \left[\frac{\partial A^s}{\partial \bar{x}^q} + A^p \left\{ \begin{matrix} s \\ p \ q \end{matrix} \right\} \right]$$

This shows that $\frac{\partial \bar{A}^i}{\partial \bar{x}^j} + \bar{A}^l \left\{ \begin{matrix} l \\ i \ j \end{matrix} \right\}$ is a mixed tensor of the second order. This is called the covariant derivative of A^i w.r.t. x^j and is denoted by $A^i_{,j}$.

Obs. The following laws hold good for covariant differentiation :

(i) Covariant derivative of the sum (or difference) of two tensors = sum (or difference) of their covariant derivatives.

(ii) Covariant derivative of the product of two tensors = covariant derivative of first tensor \times second tensor + covariant derivative of second tensor \times first tensor.

Example 38.17. Prove that the covariant derivative of g^{ij} is zero.

Solution. Let A_i denote a covariant vector which moves parallel to itself so that

$$A_{i,k} \text{ or } \frac{\partial A_i}{\partial x^k} - A_l \left\{ \begin{matrix} l \\ i \ k \end{matrix} \right\} = 0 \quad \dots(i)$$

Let $\phi = g^{ij} A_i A_j$, so that ϕ is a scalar invariant. Differentiating it w.r.t. x^k , we have

$$\begin{aligned}\frac{\partial \phi}{\partial x^k} &= \frac{\partial g^{ij}}{\partial x^k} A_i A_j + g^{ij} \frac{\partial A_i}{\partial x^k} A_j + g^{ij} A_i \frac{\partial A_j}{\partial x^k} \\ &= \frac{\partial g^{ij}}{\partial x^k} A_i A_j + g^{ij} \left\{ \begin{matrix} l \\ i \ k \end{matrix} \right\} A_i A_j + g^{ij} \left\{ \begin{matrix} l \\ j \ k \end{matrix} \right\} A_i A_l\end{aligned}\quad [\text{By (i)}]$$

Interchanging i and l in the second term and j and l in the last term on the right, we get

$$\frac{\partial \phi}{\partial x^k} = \left[\frac{\partial g^{ij}}{\partial x^k} + g^{il} \left\{ \begin{matrix} i \\ l \ k \end{matrix} \right\} + g^{il} \left\{ \begin{matrix} j \\ l \ k \end{matrix} \right\} \right] A_i A_j$$

Since $\partial \phi / \partial x^k$ is a covariant vector, the expression

$$\frac{\partial g^{ij}}{\partial x^k} + g^{il} \left\{ \begin{matrix} i \\ l \ k \end{matrix} \right\} + g^{il} \left\{ \begin{matrix} j \\ l \ k \end{matrix} \right\}$$

is a tensor of the third order by quotient law. Thus it is the covariant derivative $g^{ij,k}$.

$$\begin{aligned}g^{ij,k} &= \frac{\partial g^{ij}}{\partial x^k} + g^{il} \left\{ \begin{matrix} i \\ l \ k \end{matrix} \right\} + g^{il} \left\{ \begin{matrix} j \\ l \ k \end{matrix} \right\} \\ &= -g^{jl} \left\{ \begin{matrix} i \\ l \ k \end{matrix} \right\} - g^{im} \left\{ \begin{matrix} j \\ m \ k \end{matrix} \right\} + g^{ij} \left\{ \begin{matrix} i \\ l \ k \end{matrix} \right\} + g^{il} \left\{ \begin{matrix} j \\ l \ k \end{matrix} \right\} \\ &= -g^{im} \left\{ \begin{matrix} j \\ m \ k \end{matrix} \right\} + g^{il} \left\{ \begin{matrix} j \\ l \ k \end{matrix} \right\} = -g^{il} \left\{ \begin{matrix} j \\ l \ k \end{matrix} \right\} + g^{il} \left\{ \begin{matrix} j \\ l \ k \end{matrix} \right\} = 0\end{aligned}\quad [\text{By Ex. 38.15 (b)}]$$

[Changing the dummy index m to l]

38.20 (1) GRADIENT

If ϕ be a scalar function of the coordinates, then the gradient of ϕ is denoted by $\text{grad } \phi = \frac{\partial \phi}{\partial x^i}$ which is a covariant vector.

(2) Divergence. The divergence of the contravariant vector A^i is defined by

$$\text{div } A^i = \frac{\partial A^i}{\partial x^i} + A^k \left\{ \begin{matrix} l \\ k \ i \end{matrix} \right\} \text{ which is sometimes written as } A^i_{,i}.$$

The divergence of the covariant vector A_i is defined by $\text{div } A_i = g^{ik} A_{ik}$.

(3) Curl. Let A_i be a covariant vector, then

$$A_{i,j} = \frac{\partial A_i}{\partial x^j} - A_k \left\{ \begin{matrix} k \\ i \ j \end{matrix} \right\} \text{ and } A_{j,i} = \frac{\partial A_j}{\partial x^i} - A_k \left\{ \begin{matrix} k \\ j \ i \end{matrix} \right\} \text{ are covariant tensors.}$$

$$\therefore A_{i,j} - A_{j,i} = \frac{\partial A_i}{\partial x^j} - \frac{\partial A_j}{\partial x^i}$$

is a covariant tensor of second order, which is called curl of A_i .

$$\text{Thus } \text{curl } A_i = A_{i,j} - A_{j,i}$$

Obs 1. $\text{curl } A_i$ is a skew-symmetric tensor.

$$\text{Since } A_{j,i} - A_{i,j} = -(A_{i,j} - A_{j,i}).$$

Obs. 2. Curl is a tensor and not a vector. In a 3-dimensional space, however, curl has only three independent non-zero components and it can, therefore, be taken as a vector.

Example 38.18. Prove that

$$(a) \text{div } A_i = \frac{1}{\sqrt{g}} \cdot \frac{\partial}{\partial x^k} (\sqrt{g} A^k)$$

$$(b) \nabla^2 \phi = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^k} \left(\sqrt{g} g^{kr} \frac{\partial \phi}{\partial x^r} \right).$$

Solution. (a) Using

$$\begin{Bmatrix} i \\ k \ i \end{Bmatrix} = \frac{\partial}{\partial x^k} \log \sqrt{g} = \frac{1}{\sqrt{g}} \frac{\partial \sqrt{g}}{\partial x^k}$$

[By Ex. 38.16]

$$\begin{aligned} \operatorname{div} A^i &= \frac{\partial A^i}{\partial x^i} + A^k \begin{Bmatrix} i \\ k \ i \end{Bmatrix} = \frac{\partial A^i}{\partial x^i} + \frac{A^k}{\sqrt{g}} \frac{\partial \sqrt{g}}{\partial x^k} = \frac{\partial A^i}{\partial x^i} + \frac{A^k}{\sqrt{g}} \frac{\partial \sqrt{g}}{\partial x^k} \\ &= \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^i} (\sqrt{g} A^i) \end{aligned} \quad \dots(i)$$

(ii) We have

$$\nabla^2 \phi = \operatorname{div} \operatorname{grad} \phi$$

\dots(ii)

and

$$\operatorname{grad} \phi = \frac{\partial \phi}{\partial x^r}, \text{ which is a covariant vector.}$$

The contravariant vector associated with $\partial \phi / \partial x^r$ is

$$A^k = g^{kr} \frac{\partial \phi}{\partial x^r}.$$

$$\text{Then from (i) and (ii), } \nabla^2 \phi = \operatorname{div} \left(g^{kr} \frac{\partial \phi}{\partial x^r} \right) = \frac{1}{\sqrt{g}} \frac{\partial}{\partial x^k} \left(\sqrt{g} g^{kr} \frac{\partial \phi}{\partial x^r} \right).$$

PROBLEMS 38.4

- Determine Christoffel symbols of the first and second kind for an orthogonal curvilinear coordinate system.
- Determine the Christoffel symbols of the first kind in (a) rectangular, (b) cylindrical and (c) spherical coordinates.
- Evaluate the Christoffel symbols of the second kind in (a) rectangular, (b) cylindrical and (c) spherical coordinates.
- Prove that (a) $[pq, r] = [qp, r]$, (b) $[pq, r] = g_{rs} \begin{Bmatrix} s \\ pq \end{Bmatrix}$
- If $(ds)^2 = r^2(d\theta)^2 + r^2 \sin^2 \theta (d\phi)^2$, find the values of
 - $[22, 1]$ and $[12, 2]$
 - $\begin{bmatrix} 1 \\ 22 \end{bmatrix}$ and $\begin{bmatrix} 2 \\ 12 \end{bmatrix}$
- If $(ds)^2 = (dr)^2 + r^2(d\theta)^2 + r^2 \sin^2 \theta (d\phi)^2$, find the values of
 - $[33, 1]$ and $[23, 3]$
 - $\begin{bmatrix} 1 \\ 33 \end{bmatrix}$ and $\begin{bmatrix} 3 \\ 23 \end{bmatrix}$
- Show that the tensors g_{ij} , g^{ij} and δ_{ij} are constants with respect to covariant differentiation.
- Write the covariant derivative w.r.t. x^i of the tensors u^i and A^k_i .
- Show that the covariant derivative of g_{ij} is zero.
- Find the covariant derivative $A_{ik} B^{im}$ with respect to x^q .
- Evaluate $\operatorname{div} A^i$ in (a) cylindrical, (b) spherical coordinates.
- Obtain the Laplace's equation in (a) cylindrical, (b) spherical coordinates.
- If A_{ijk} is the curl of a covariant vector, prove that

$$A_{ijk} + A_{jki} + A_{kij} = 0.$$
(Madras M.E., 2000 S)
- Using tensor notation, show that
 - $\operatorname{div} \operatorname{curl} A^i = 0$
 - $\operatorname{curl} \operatorname{grad} \phi = 0$.

Useful Information

I. BASIC DATA

1. Basic Constants

$$e = 2.7183$$

$$\pi = 3.1416$$

$$\sqrt{2} = 1.4142$$

$$1/e = 0.3679$$

$$1/\pi = 0.3183$$

$$\sqrt{3} = 1.732$$

$$\log_e 2 = 0.6931$$

$$\log_e 10 = 2.3026$$

$$1 \text{ rad.} = 57^\circ 17' 45''$$

$$\log_3 2 = 1.0986$$

$$\log_{10} e = 0.4343$$

$$1^\circ = 0.0174 \text{ rad.}$$

2. Conversion Factors

$$1 \text{ ft.} = 30.48 \text{ cm} = 0.3048 \text{ m}$$

$$1 \text{ ft}^2 = 0.0929 \text{ m}^2$$

$$1 \text{ ft}^3 = 0.0283 \text{ m}^3$$

$$1 \text{ m/sec} = 3.2804 \text{ ft/sec.}$$

$$1 \text{ m} = 100 \text{ cm} = 3.2804 \text{ ft.}$$

$$1 \text{ acre} = 4840 \text{ yd}^2 = 4046.77 \text{ m}^2$$

$$1 \text{ m}^3 = 35.32 \text{ ft}^3$$

$$1 \text{ mile/h} = 1.609 \text{ km/h.}$$

3. Systems of Units

Quantity	F.P.S. system	C.G.S. system	M.K.S. system

5. Some Notations

\in	belongs to	\cup	union
\notin	does not belong to	\cap	intersection
\Rightarrow	implies	\exists	such that
\Leftrightarrow	implies & implied by		

Factorial n i.e., $n! = n(n-1)(n-2) \dots 3 \cdot 2 \cdot 1$.

Double factorials : $(2n)! = 2n(2n-2)(2n-4) \dots 6 \cdot 4 \cdot 2$.

$(2n-1)!! = (2n-1)(2n-3)(2n-5) \dots 5 \cdot 3 \cdot 1$.

Stirling's approximation. When n is large $n! \sim \sqrt{2\pi n} \cdot n^n e^{-n}$.

II. ALGEBRA

1. Quadratic equation : $ax^2 + bx + c = 0$ has roots

$$\alpha = \frac{-b + \sqrt{b^2 - 4ac}}{2a}, \beta = \frac{-b - \sqrt{b^2 - 4ac}}{2a}$$

$$\alpha + \beta = -\frac{b}{a}, \alpha\beta = \frac{c}{a}.$$

Roots are equal if $b^2 - 4ac = 0$

Roots are real and distinct if $b^2 - 4ac > 0$

Roots are imaginary if $b^2 - 4ac < 0$

2. Cubic equation : $x^3 + lx^2 + mx + n = 0$

Cardan's method :

- (i) Remove x^2 term by putting $y = x - (-l/3)$
- (ii) Equate coeffs. in the new equation and $y^3 - 3uy - (u^3 + v^3) = 0$
- (iii) Find u^3 and v^3 . Then find u and v .
- (iv) Get $y = u + v$ and $x = y - l/3$.

$$\because y = u + v$$

3. Biquadratic equation : $x^4 + kx^3 + lx^2 + mx + n = 0$

I. Ferrari's method :

- (i) Combine x^4 and x^3 terms into a perfect square by adding a term in λ .
- (ii) Make R.H.S. a perfect square to find λ .
- (iii) Solve resulting quadratic equations.

II. Descarte's method :

- (i) Remove x^3 term by putting $y = x - (-k/4)$
- (ii) Equate transformed expression to $(y^2 + py + q)(y^2 - py + q') = 0$
- (iii) Equate coeffs. of like powers from both sides.
- (iv) Find p, q and q' and solve resulting quadratics.

4. Cross-multiplication : $a_1x + b_1y + c_1z = 0$

$$a_2x + b_2y + c_2z = 0$$

Then

$$\frac{x}{b_1c_2 - b_2c_1} = \frac{y}{c_1a_2 - c_2a_1} = \frac{z}{a_1b_2 - a_2b_1}$$

5. Method of least squares :

(i) *Straight line of best fit* $y = a + bx$.

Normal equations : $\Sigma y = na + b\Sigma x, \Sigma xy = a\Sigma x + b\Sigma x^2$.

To find a, b, solve these equations.

(ii) *Parabola of best fit* $y = a + bx + cx^2$

Normal equations : $\Sigma y = na + b\Sigma x + c\Sigma x^2$,

$$\Sigma xy = a\Sigma x + b\Sigma x^2 + c\Sigma x^3, \Sigma x^2y = a\Sigma x^2 + b\Sigma x^3 + c\Sigma x^4$$

To find a, b, c, solve these equations.

6. Progressions :

(i) Numbers $a, a+d, a+2d, \dots$ are said to be in *Arithmetic progression (A.P.)*

Its n th term $T_n = a + \frac{n-1}{2} d$ and sum $S_n = \frac{n}{2} (2a + (n-1)d)$

(ii) Numbers a, ar, ar^2, \dots , are said to be in *Geometric progression (G.P.)*

Its n th term $T_n = ar^{n-1}$ and sum $S_n = \frac{a(1-r^n)}{1-r}, S_\infty = \frac{a}{1-r}$ ($r < 1$)

(iii) Numbers $1/a$, $1/(a+d)$, $1/(a+2d)$, are said to be in *Harmonic progression (H.P.)* (i.e., a sequence is said to be in H.P. if its reciprocals are in A.P.)

Its n th term $T_n = 1/(a + \frac{n-1}{n-1} d)$

(iv) If a and b be two numbers then their

$$\text{Arithmetic mean} = \frac{1}{2}(a+b), \text{ Geometric mean} = \sqrt{ab}, \text{ Harmonic mean} = 2ab/(a+b)$$

(v) Natural numbers are 1, 2, 3,, n .

$$\Sigma n = \frac{n(n+1)}{2}, \Sigma n^2 = \frac{n(n+1)(2n+1)}{6}, \Sigma n^3 = \left\{ \frac{n(n+1)}{2} \right\}^2$$

7. Permutations and Combinations

$${}^n P_r = \frac{n!}{(n-r)!}; {}^n C_r = \frac{n!}{r!(n-r)!} = \frac{{}^n P_r}{r!}; {}^n C_{n-r} = {}^n C_r; {}^n C_0 = 1 = {}^n C_n.$$

8. Binomial theorem

(i) When n is a positive integer

$$(1+x)^n = 1 + {}^n C_1 x + {}^n C_2 x^2 + {}^n C_3 x^3 + \dots + {}^n C_n x^n.$$

(ii) When n is a negative integer or a fraction

$$(1+x)^n = 1 + nx + \frac{n(n-1)}{1 \cdot 2} x^2 + \frac{n(n-1)(n-2)}{1 \cdot 2 \cdot 3} x^3 + \dots =$$

$$(iii) \text{ Binomial coefficients : } {}^n C_r = \frac{n!}{r!(n-r)!}$$

9. Logarithms

(i) *Natural logarithm* $\log x$ has base e and is inverse of e^x .

Common logarithm $\log_{10} x = M \log x$ where $M = \log_{10} e = 0.4343$

(ii) $\log_a 1 = 0$; $\log_a 0 = -\infty$ ($a > 1$); $\log_a a = 1$.

(iii) $\log(mn) = \log m + \log n$; $\log(m/n) = \log m - \log n$; $\log(m^n) = n \log m$.

10. Partial Fractions

A fraction of the form $\frac{a_0 x^m + a_1 x^{m-1} + \dots + a_m}{b_0 x^n + b_1 x^{n-1} + \dots + b_n}$

in which m and n are positive integers, is called a *rational algebraic fraction*. When the numerator is of a lower degree than the denominator, it is called a *proper fraction*.

To resolve a given fraction into partial fractions, we first factorise the denominator into real factors. These will be either linear or quadratic, and some factors repeated. Then the proper fraction is resolved into a sum of partial fractions such that

(i) to a non-repeated linear factor $x - a$ in the denominator corresponds a partial fraction of the form $A/(x - a)$;

(ii) to a repeated linear factor $(x - a)^r$ in the denominator corresponds the sum of r partial fractions of the

form $\frac{A_1}{x-a} + \frac{A_2}{(x-a)^2} + \frac{A_3}{(x-a)^3} + \dots + \frac{A_r}{(x-a)^r}$;

(iii) to a non-repeated quadratic factor $(x^2 + ax + b)$ in the denominator, corresponds a partial fraction of the form $\frac{Ax+B}{x^2 + ax + b}$;

(iv) to a repeated quadratic factor $(x^2 + ax + b)^r$ in the denominator, corresponds the sum of r partial fractions of the form $\frac{A_1 x + B_1}{x^2 + ax + b} + \frac{A_2 x + B_2}{(x^2 + ax + b)^2} + \dots + \frac{A_r x + B_r}{(x^2 + ax + b)^r}$.

Then we have to determine the unknown constants A, A_1, B_1 etc.

To obtain the partial fraction corresponding to the non-repeated linear factor $x - a$ in the denominator, put $x = a$ everywhere in the given fraction except in the factor $x - a$ itself.

In all other cases, equate the given fraction to a sum of suitable partial fractions in accordance with (i) to (iv) above, having found the partial fractions corresponding to the non-repeated linear factors by the above rule. Then multiply both sides by the denominator of the given fraction and equate the coefficients of like powers of x or substitute convenient numerical values of x on both sides. Finally solve the simplest of the resulting equations to find the unknown constants.

11. Matrices

- (i) A system of mn numbers arranged in a rectangular array of m rows and n columns is called a **matrix** of order $m \times n$.
In particular if $m = n$, it is called a **square matrix** of order n .
- (ii) Two matrices of the same order can be added or subtracted by adding or subtracting the corresponding elements.
- (iii) Product of a matrix A by a scalar k is a matrix whose each element is k times the corresponding elements of A .
- (iv) Two matrices can be multiplied only when the number of columns in the first is equal to the number of rows in the second. If A is of order $m \times n$ and B is of order $n \times p$, then the product AB is a matrix of order $m \times p$, obtained by multiplying and adding the row elements of A with the corresponding column elements of B .
- (v) Transpose of a matrix A is the matrix obtained by interchanging its rows and columns and is denoted by A' .

A square matrix A is said to be **symmetric** if $A = A'$ and **skew symmetric** if $A = -A'$.

- (vi) If A and B are two square matrices such that $AB = I$ (i.e., a unit matrix), then B is called the **inverse** of A and is denoted by A^{-1} . Then $AA^{-1} = A^{-1}A = I$.
- (vii) **Rank of a matrix** is the largest order of any non-vanishing minor of the matrix.
- (viii) **Consistency of a system of equations in n unknowns**.
If the rank of the coefficient matrix A be r and that of the augmented matrix K be r' , then
 - (a) the equations are inconsistent (i.e. there is no solution) when $r \neq r'$,
 - (b) the equations are consistent when $r = r'$.
 - (c) the equations are consistent and there are infinite number of solutions when $r = r' < n$.
- (ix) **Eigen values**: If A is any square matrix of order n , then the determinant of the matrix $A - \lambda I_n$ equated to zero is called the **Characteristic equation** of A and its roots are called the **eigen values of A** .
- (x) **Cayley Hamilton theorem**: Every square matrix satisfies its own characteristic equation.

12. Determinants

- (i) A **determinant** is defined for a square matrix A and is denoted by $| A |$. Unlike a matrix it has a single value e.g.,

$$\begin{aligned}| A | &= \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix} = a_1 \begin{vmatrix} b_2 & c_2 \\ b_3 & c_3 \end{vmatrix} - b_1 \begin{vmatrix} a_2 & c_2 \\ a_3 & c_3 \end{vmatrix} + c_1 \begin{vmatrix} a_2 & b_2 \\ a_3 & b_3 \end{vmatrix} \\&= a_1(b_2c_3 - b_3c_2) - b_1(a_2c_3 - a_3c_2) + c_1(a_2b_3 - a_3b_2)\end{aligned}$$

In this way, determinant can be expanded in terms of any row or column.

- (ii) **Properties :**
 - I. A determinant remains unaltered if its rows and columns are interchanged.
 - II. A determinant vanishes if two of its rows (or columns) are identical or proportional.
 - III. If each elements of a row (or column) consists of m terms, the determinant can be expressed as the sum of m determinants.
 - IV. If to each elements of a row (or column) be added equi-multiples of the corresponding elements of two or more rows (or columns), the determinant remains unaltered.
 - V. If the elements of a determinant Δ are functions of x and two parallel lines become identical when $x = a$, then $x - a$ is a factor of Δ .

III. GEOMETRY

1. Coordinates of a point : Cartesian (x, y) and polar (r, θ) .

$$x = r \cos \theta, \quad y = r \sin \theta$$

$$\text{or} \quad r = \sqrt{(x^2 + y^2)}, \quad \theta = \tan^{-1}(y/x). \quad (\text{Fig. 0.1}).$$

Distance between two points (x_1, y_1) and $(x_2, y_2) = \sqrt{(x_2 - x_1)^2 + (y_2 - y_1)^2}$

Point of division of the line joining (x_1, y_1) and (x_2, y_2) in the ratio $m_1 : m_2$ is

$$\left(\frac{m_1 x_2 + m_2 x_1}{m_1 + m_2}, \frac{m_1 y_2 + m_2 y_1}{m_1 + m_2} \right)$$

In a triangle having vertices $(x_1, y_1), (x_2, y_2)$ and (x_3, y_3)

$$(i) \text{ Area} = \frac{1}{2} \begin{vmatrix} x_1 & y_1 & 1 \\ x_2 & y_2 & 1 \\ x_3 & y_3 & 1 \end{vmatrix}$$

(ii) **Centroid** (point of intersection of medians) is

$$\left(\frac{x_1 + x_2 + x_3}{3}, \frac{y_1 + y_2 + y_3}{3} \right)$$

(iii) **Incentre** (point of intersection of the internal bisectors of the angles) is

$$\left(\frac{ax_1 + bx_2 + cx_3}{a+b+c}, \frac{ay_1 + by_2 + cy_3}{a+b+c} \right)$$

where a, b, c are the lengths of the sides of the triangle.

(iv) **Circumcentre** is the point of intersection of the right bisectors of the sides of the triangle.

(v) **Orthocentre** is the point of intersection of the perpendiculars drawn from the vertices to the opposite sides of the triangle.

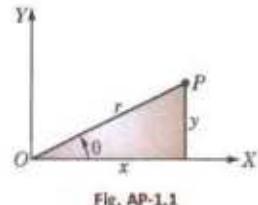

Fig. AP-1.1

2. Straight Line

$$(i) \text{ Slope of the line joining the points } (x_1, y_1) \text{ and } (x_2, y_2) = \frac{y_2 - y_1}{x_2 - x_1}$$

$$\text{Slope of the line } ax + by + c = 0 \text{ is } -\frac{a}{b} \text{ i.e., } -\frac{\text{coeff. of } x}{\text{coeff. of } y}$$

(ii) **Equation of a line**

(a) having slope m and cutting an intercept c on y -axis is $y = mx + c$.

$$(b) \text{ cutting intercepts } a \text{ and } b \text{ from the axes is } \frac{x}{a} + \frac{y}{b} = 1.$$

$$(c) \text{ passing through } (x_1, y_1) \text{ and having slope } m \text{ is } y - y_1 = m(x - x_1)$$

$$(d) \text{ passing through } (x_1, y_1) \text{ and making an } \angle \theta \text{ with the } x\text{-axis is } \frac{x - x_1}{\cos \theta} = \frac{y - y_1}{\sin \theta} = r$$

$$(e) \text{ through the point of intersection of the lines } a_1x + b_1y + c_1 = 0 \text{ and } a_2x + b_2y + c_2 = 0 \text{ is } a_1x + b_1y + c_1 + k(a_2x + b_2y + c_2) = 0$$

$$(iii) \text{ Angle between two lines having slopes } m_1 \text{ and } m_2 \text{ is } \tan^{-1} \frac{m_1 - m_2}{1 + m_1 m_2}$$

Two lines are parallel if

$$m_1 = m_2$$

Two lines are perpendicular if

$$m_1 m_2 = -1$$

Any line parallel to the line $ax + by + c = 0$ is $ax + by + k = 0$

Any line perpendicular to $ax + by + c = 0$ is $bx - ay + k = 0$

$$(iv) \text{ Length of the perpendicular from } (x_1, y_1) \text{ to the line } ax + by + c = 0, \text{ is } \frac{|ax_1 + by_1 + c|}{\sqrt{a^2 + b^2}}$$

3. Circle

(i) **Equation of the circle** having centre (h, k) and radius r is $(x - h)^2 + (y - k)^2 = r^2$

(ii) **Equation** $x^2 + y^2 + 2gx + 2fy + c = 0$ represents a circle having centre $(-g, -f)$ and radius $\sqrt{(g^2 + f^2 - c)}$.

- (iii) Equation of the tangent at the point (x_1, y_1) to the circle $x^2 + y^2 = a^2$ is $xx_1 + yy_1 = a^2$.
- (iv) Condition for the line $y = mx + c$ to touch the circle $x^2 + y^2 = a^2$ is $c = a \sqrt{1 + m^2}$.
- (v) Length of the tangent from the point (x_1, y_1) to the circle $x^2 + y^2 + 2gx + 2fy + c = 0$ is $\sqrt{(x_1^2 + y_1^2 + 2gx_1 + 2fy_1 + c)}$.

4. Parabola

- (i) Standard equation of the parabola $y^2 = 4ax$.

Its parametric equations are $x = at^2$, $y = 2at$.

Latus-rectum $LL' = 4a$, Focus is $S(a, 0)$

Directrix ZM is $x + a = 0$.

Focal distance of any point $P(x_1, y_1)$ on the parabola

$$y^2 = 4ax \text{ is } SP = x_1 + a$$

Equation of the tangent at (x_1, y_1) to the parabola $y^2 = 4ax$ is

$$yy_1 = 2a(x + x_1)$$

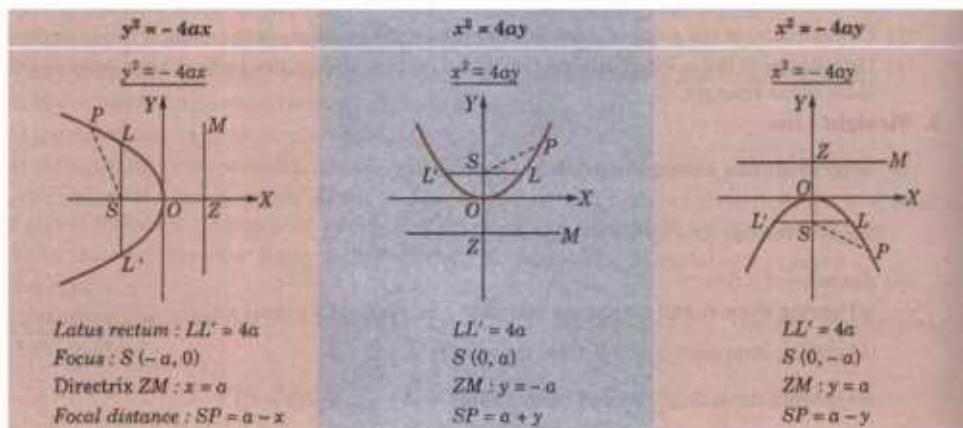

Condition for the line $y = mx + c$ to touch the parabola

$$y^2 = 4ax \text{ is } c = am^2$$

Equation of the normal to the parabola $y^2 = 4ax$ in terms of its slope m is

$$y = mx - 2am - am^3$$

- (ii) Other standard forms of parabola

5. Ellipse

- (i) Standard equation of the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ ($a > b > 0$).

Its parametric equations are $x = a \cos \theta$, $y = b \sin \theta$.

Eccentricity $e = \sqrt{1 - b^2/a^2}$,

Latus-rectum $LSL' = 2b^2/a$,

Foci $S(-ae, 0)$ and $S'(ae, 0)$

Directrices ZM ($x = -a/e$) and $Z'M'$ ($x = a/e$).

Sum of the focal distances of any point on the ellipse is equal to the major axis i.e.,

$$SP + S'P = 2a.$$

Equation of the tangent at the point (x_1, y_1) to the ellipse

$$\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1 \text{ is } \frac{xx_1}{a^2} + \frac{yy_1}{b^2} = 1.$$

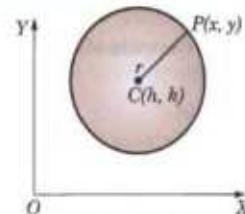

Fig. AP-1.2

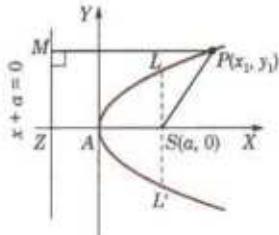

Fig. AP-1.3

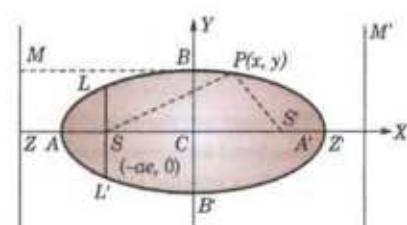

Fig. AP-1.4

Condition for the line $y = mx + c$ to touch the ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$
is $c = \sqrt{(a^2 m^2 + b^2)}$

(ii) Another standard form of ellipse $\frac{x^2}{a^2} + \frac{y^2}{b^2} = 1$ ($a > b > 0$)

Vertices: $A(0, a)$; $A'(0, -a)$

Foci: $S(0, ae)$; $S'(0, -ae)$

Directrices: $ZM: y = a/e$, $Z'M': y = -a/e$

Latus rectum: $LSL' = 2b^2/a$

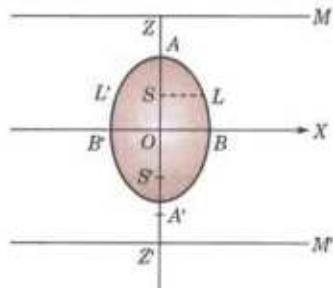

Fig. AP-1.4 (a)

6. Hyperbola

(i) Standard equations of the hyperbola is

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1.$$

Its parametric equations are

$$x = a \sec \theta, \quad y = b \tan \theta.$$

Eccentricity $e = \sqrt{(1 + b^2/a^2)}$,

Latus rectum $LSL' = 2b^2/a$.

Directrices

$$ZM (x = a/e) \text{ and } Z'M' (x = -a/e).$$

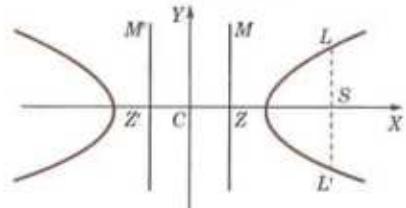

Fig. AP-1.5

(ii) Equation of the tangent at the point (x_1, y_1) to the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \text{ is } \frac{xx_1}{a^2} - \frac{yy_1}{b^2} = 1.$$

(iii) Condition for the line $y = mx + c$ to touch the hyperbola

$$\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1 \text{ is } c = \sqrt{(a^2 m^2 - b^2)}$$

(iv) Asymptotes of the hyperbola $\frac{x^2}{a^2} - \frac{y^2}{b^2} = 1$ are $\frac{x}{a} + \frac{y}{b} = 0$ and $\frac{x}{a} - \frac{y}{b} = 0$.

(v) Equation of the rectangular hyperbola with asymptotes as axes is $xy = c^2$.

Its parametric equations are $x = ct$, $y = c/t$.

7. Nature of a conic

The equation $ax^2 + 2hxy + by^2 + 2gx + 2fy + c = 0$ represents

(i) a pair of lines, if $\begin{vmatrix} a & h & g \\ h & b & f \\ g & f & c \end{vmatrix} (= \Delta) = 0$

(ii) a circle, if $a = b$, $h = 0$, $\Delta \neq 0$

(iii) a parabola, if $ab - h^2 = 0$, $\Delta \neq 0$.

(iv) an ellipse, if $ab - h^2 > 0$, $\Delta \neq 0$.

(v) a hyperbola, if $ab - h^2 < 0$, $\Delta \neq 0$,

and a rectangular hyperbola if in addition, $a + b = 0$.

IV. SOLID GEOMETRY

1. (i) If l, m, n be the direction cosines of a line then $l^2 + m^2 + n^2 = 1$.

If a, b, c be the direction ratios of a line then $l = \frac{a}{\sqrt{\Sigma a^2}}$; $m = \frac{b}{\sqrt{\Sigma a^2}}$; $n = \frac{c}{\sqrt{\Sigma a^2}}$

(ii) If θ be the angle between the lines having d.c.'s l, m, n and l', m', n' , then

$$\cos \theta = ll' + mm' + nn'$$

Lines are perpendicular if, $ll' + mm' + nn' = 0$

Lines are parallel if $l = l'$, $m = m'$, $n = n'$

- (iii) Projection of the line joining the points (x_1, y_1, z_1) and (x_2, y_2, z_2) on a line having d.e.'s $l, m, n = l(x_1 - x_2) + m(y_1 - y_2) + n(z_1 - z_2)$.

2. Plane

- (i) Different forms of equation of a plane

— General form : $ax + by + cz = d$

where a, b, c are the d.r.s of a normal to the plane.

— Normal form : $lx + my + nz = p$

— Intercept form : $\frac{x}{a} + \frac{y}{b} + \frac{z}{c} = 1$.

— Any plane passing through the point (x_1, y_1, z_1) is $a(x - x_1) + b(y - y_1) + c(z - z_1) = 0$

- (ii) Angle θ between the planes $ax + by + cz = d$ and $a'x + b'y + c'z = d'$ is given by

$$\cos \theta = \frac{aa' + bb' + cc'}{\sqrt{(a^2 + b^2 + c^2)} \sqrt{(a'^2 + b'^2 + c'^2)}}$$

Planes are perpendicular if $aa' + bb' + cc' = 0$

Planes are parallel if $a/a' = b/b' = c/c'$

- (iii) Any plane parallel to the plane $ax + by + cz = d$ is $ax + by + cz = k$.

3. Straight line

- (i) Equation of the line through the point (x_1, y_1, z_1) having d.r.s a, b, c is

$$\frac{x - x_1}{a} = \frac{y - y_1}{b} = \frac{z - z_1}{c} \quad (\text{Symmetrical form})$$

- (ii) Equation of the line through the points (x_1, y_1, z_1) and (x_2, y_2, z_2) is

$$\frac{x - x_1}{x_2 - x_1} = \frac{y - y_1}{y_2 - y_1} = \frac{z - z_1}{z_2 - z_1} \quad (\text{Two point form})$$

- (iii) Angle θ between the plane $ax + by + cz = d$ and the line

$$\frac{x - x_1}{a'} = \frac{y - y_1}{b'} = \frac{z - z_1}{c'}$$

is $\sin \theta = \frac{aa' + bb' + cc'}{\sqrt{(a^2 + b^2 + c^2)} \sqrt{(a'^2 + b'^2 + c'^2)}}$

Line is parallel to the plane if $aa' + bb' + cc' = 0$

Line is perpendicular to the plane if $a/a' = b/b' = c/c'$

- (iv) Coplanar lines

Two lines $\frac{x - x_1}{l_1} = \frac{y - y_1}{m_1} = \frac{z - z_1}{n_1}$ and $\frac{x - x_2}{l_2} = \frac{y - y_2}{m_2} = \frac{z - z_2}{n_2}$

are coplanar if $\begin{vmatrix} x_2 - x_1 & y_2 - y_1 & z_2 - z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$

and equation of the plane containing these lines is

$$\begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ l_1 & m_1 & n_1 \\ l_2 & m_2 & n_2 \end{vmatrix} = 0$$

- (v) Shortest distance between two skew lines

$$\frac{x - x_1}{l_1} = \frac{y - y_1}{m_1} = \frac{z - z_1}{n_1} \text{ and } \frac{x - x_2}{l_2} = \frac{y - y_2}{m_2} = \frac{z - z_2}{n_2}$$

is $l(x_2 - x_1) + m(y_2 - y_1) + n(z_2 - z_1)$

where l, m, n are given by $ll_1 + mm_1 + nn_1 = 0$ and $ll_2 + mm_2 + nn_2 = 0$

Equation of the line of S.D. is given by

$$\begin{vmatrix} x - x_1 & y - y_1 & z - z_1 \\ l_1 & m_1 & n_1 \\ l & m & n \end{vmatrix} = 0 \text{ and } \begin{vmatrix} x - x_2 & y - y_2 & z - z_2 \\ l_2 & m_2 & n_2 \\ l & m & n \end{vmatrix} = 0$$

4. Sphere

(i) *Equation of the sphere* having centre (a, b, c) and radius r is

$$(x - a)^2 + (y - b)^2 + (z - c)^2 = r^2$$

(ii) *Equation* $x^2 + y^2 + z^2 + 2ux + 2vy + 2wz + d = 0$ represents a sphere having centre $(-u, -v, -w)$ and radius $\sqrt{(u^2 + v^2 + w^2 - d)}$

(iii) *Equation of the sphere* having the points (x_1, y_1, z_1) and (x_2, y_2, z_2) as the ends of a diameter is $(x - x_1)(x - x_2) + (y - y_1)(y - y_2) + (z - z_1)(z - z_2) = 0$

(iv) *Equation of a circle* (i.e., section of a sphere $S = 0$ by the plane $U = 0$) is given by $S = 0$ and $U = 0$ taken together.

(v) *Equation of any sphere* through the circle of intersection of the sphere $S = 0$ and the plane $U = 0$ is $S + kU = 0$.

(vi) *Tangent plane* at any point (x_1, y_1, z_1) of the sphere

$$x^2 + y^2 + z^2 + 2ux + 2vy + 2wz + d = 0 \text{ is}$$

$$xx_1 + yy_1 + zz_1 + u(x + x_1) + v(y + y_1) + w(z + z_1) + d = 0$$

(vii) Two spheres $x^2 + y^2 + z^2 + 2ux + 2vy + 2wz + d = 0$ and

$$x^2 + y^2 + z^2 + 2u'x + 2v'y + 2w'z + d' = 0 \text{ cut orthogonally if } 2uu' + 2vv' + 2ww' = d + d'.$$

5. Cone

(i) *Equation of a cone* with vertex at the origin is a homogeneous equation of the second degree in x, y, z .

(ii) *Enveloping cone* of the sphere $S = 0$ with vertex (x_1, y_1, z_1) is $SS_1 = T^2$ where $S = x^2 + y^2 + z^2 - a^2$, $S_1 = x_1^2 + y_1^2 + z_1^2 - a^2$, $T = xx_1 + yy_1 + zz_1 - a^2$

6. Quadric surfaces

(i) *Ellipsoid:* $\frac{x^2}{a^2} + \frac{y^2}{b^2} + \frac{z^2}{c^2} = 1$

(ii) *Hyperboloid of one sheet:* $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 1$

Hyperboloid of two sheets: $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = -1$

(iii) *Cone:* $\frac{x^2}{a^2} + \frac{y^2}{b^2} - \frac{z^2}{c^2} = 0$

(iv) *Elliptic paraboloid:* $\frac{x^2}{a^2} + \frac{y^2}{b^2} = \frac{2z}{c}$

Hyperbolic paraboloid: $\frac{x^2}{a^2} - \frac{y^2}{b^2} = \frac{2z}{c}$

7. Volumes and surface areas

Solid	Volume	Curved surface area	Total surface area
Cube (side a)	a^3	$6a^2$	$6a^2$
Cuboid (length l , breadth b , height h)	lwh	$2(l + b)h$	$2(lb + bh + hl)$
Sphere (radius r)	$\frac{4}{3}\pi r^3$	—	$4\pi r^2$
Cylinder (base radius r , height h)	$\pi r^2 h$	$2\pi rh$	$2\pi r(r + h)$
Cone (base radius r , height h)	$\frac{1}{3}\pi r^2 h$	$\pi r l$	$\pi r(r + l)$

where slant height l is given by $l = \sqrt{(r^2 + h^2)}$.

V. TRIGONOMETRY

1.

θ°	0	30	45	60	90	180	270	360
$\sin \theta$	0	$1/\sqrt{2}$	$1/\sqrt{2}$	$\sqrt{3}/2$	1	0	-1	0
$\cos \theta$	1	$\sqrt{3}/2$	$1/\sqrt{2}$	$1/2$	0	-1	0	1
$\tan \theta$	0	$1/\sqrt{3}$	1	$\sqrt{3}$	∞	0	$-\infty$	0

2. Signs and variations of t-ratios

Quadrant	$\sin \theta$	$\cos \theta$	$\tan \theta$
I	+	+	(0 to ∞)
II	+	-	($-\infty$ to 0)
III	-	-	(0 to $-\infty$)
IV	-	+	($-\infty$ to 0)

3. Any t-ratio of $(n \cdot 90^{\circ} \pm \theta) = \pm$ same ratio of θ , when n is even. $= \pm$ co-ratio of θ , when n is odd.The sign + or - is to be decided from the quadrant in which $n \cdot 90^{\circ} \pm \theta$ lies.

e.g., $\sin 570^{\circ} = \sin (6 \times 90^{\circ} + 30^{\circ}) = -\sin 30^{\circ} = -\frac{1}{2}$,

$$\tan 315^{\circ} = \tan (3 \times 90^{\circ} + 45^{\circ}) = -\cot 45^{\circ} = -1$$

4. $\sin (A \pm B) = \sin A \cos B \pm \cos A \sin B$

$$\cos (A \pm B) = \cos A \cos B \mp \sin A \sin B$$

$$\sin 2A = 2 \sin A \cos A = 2 \tan A / (1 + \tan^2 A)$$

$$\cos 2A = \cos^2 A - \sin^2 A = 1 - 2 \sin^2 A = 2 \cos^2 A - 1 = \frac{1 - \tan^2 A}{1 + \tan^2 A}$$

$$\tan (A \pm B) = \frac{\tan A \pm \tan B}{1 \mp \tan A \tan B}; \tan 2A = \frac{2 \tan A}{1 - \tan^2 A}$$

5. $\sin A \cos B = \frac{1}{2} [\sin (A + B) + \sin (A - B)]$

$$\cos A \sin B = \frac{1}{2} [\sin (A + B) - \sin (A - B)]$$

$$\cos A \cos B = \frac{1}{2} [\cos (A + B) + \cos (A - B)]$$

$$\sin A \sin B = \frac{1}{2} [\cos (A - B) - \cos (A + B)]$$

6. $\sin C + \sin D = 2 \sin \frac{C+D}{2} \cos \frac{C-D}{2}$

$$\sin C - \sin D = 2 \cos \frac{C+D}{2} \sin \frac{C-D}{2}$$

$$\cos C + \cos D = 2 \cos \frac{C+D}{2} \cos \frac{C-D}{2}$$

$$\cos C - \cos D = -2 \sin \frac{C+D}{2} \sin \frac{C-D}{2}$$

7. $\sin 3A = 3 \sin A - 4 \sin^3 A$, $\cos 3A = 4 \cos^3 A - 3 \cos A$; $\tan 3A = \frac{3 \tan A - \tan^3 A}{1 - 3 \tan^2 A}$

8. $a \sin x + b \cos x = r \sin(x + \theta)$
 $a \cos x + b \sin x = r \cos(x - \theta)$

where $a = r \cos \theta$, $b = r \sin \theta$ so that $r = \sqrt{a^2 + b^2}$, $\theta = \tan^{-1}(b/a)$

9. In any ΔABC :

(i) $a/\sin A = b/\sin B = c/\sin C$ (Sine formula)

(ii) $\cos A = \frac{b^2 + c^2 - a^2}{2bc}$ (Cosine formula)

(iii) $a = b \cos C + c \cos B$ (Projection formula)

(iv) Area of $\Delta ABC = \frac{1}{2} bc \sin A = \sqrt{s(s-a)(s-b)(s-c)}$ where $s = \frac{1}{2}(a+b+c)$.

10. Series

(i) Exponential series : $e^x = 1 + \frac{x}{1!} + \frac{x^2}{2!} + \frac{x^3}{3!} + \dots \infty$

(ii) Sin, cos, sinh, cosh series

$$\sin x = x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \infty, \quad \cos x = 1 - \frac{x^2}{2!} + \frac{x^4}{4!} - \dots \infty$$

$$\sinh x = x + \frac{x^3}{3!} + \frac{x^5}{5!} + \dots \infty, \quad \cosh x = 1 + \frac{x^2}{2!} + \frac{x^4}{4!} + \dots \infty$$

(iii) Log series

$$\log(1+x) = x - \frac{x^2}{2} + \frac{x^3}{3} - \dots \infty, \quad \log(1-x) = -\left(x + \frac{x^2}{2} + \frac{x^3}{3} + \dots \infty\right)$$

(iv) Gregory series

$$\tan^{-1} x = x - \frac{x^3}{3} + \frac{x^5}{5} - \dots \infty, \quad \tanh^{-1} x = \frac{1}{2} \log \frac{1+x}{1-x} = x + \frac{x^3}{3} + \frac{x^5}{5} + \dots \infty$$

11. (i) Complex number : $z = x + iy = r(\cos \theta + i \sin \theta) = r e^{i\theta}$ [see Fig. AP-1.1]

(ii) Euler's theorem : $\cos \theta + i \sin \theta = e^{i\theta}$

(iii) Demoivre's theorem : $(\cos \theta + i \sin \theta)^n = \cos n\theta + i \sin n\theta$

12. (i) Hyperbolic functions : (i) $\sinh x = \frac{e^x - e^{-x}}{2}$; $\cosh x = \frac{e^x + e^{-x}}{2}$;

$$\tanh x = \frac{\sinh x}{\cosh x}; \coth x = \frac{\cosh x}{\sinh x}; \operatorname{sech} x = \frac{1}{\cosh x}; \operatorname{cosech} x = \frac{1}{\sinh x}$$

(ii) Relations between hyperbolic and circular functions :

$$\sin ix = i \sinh x; \cos ix = \cosh x; \tan ix = i \tanh x.$$

(iii) Inverse hyperbolic functions:

$$\sinh^{-1} x = \log[x + \sqrt{x^2 + 1}]; \cosh^{-1} x = \log[x + \sqrt{(x^2 - 1)}]; \tanh^{-1} x = \frac{1}{2} \log \frac{1+x}{1-x}$$

VI. DIFFERENTIAL CALCULUS

1. Standard limits :

(i) $\lim_{x \rightarrow a} \frac{x^n - a^n}{x - a} = na^{n-1}$, n any rational number (ii) $\lim_{x \rightarrow 0} \frac{\sin x}{x} = 1$

(iii) $\lim_{x \rightarrow 0} (1+x)^{1/x} = e$ (iv) $\lim_{x \rightarrow \infty} x^{1/x} = 1$

(v) $\lim_{x \rightarrow 0} \frac{a^x - 1}{x} = \log_a a$

2. Differentiation

(i) $\frac{d}{dx}(uv) = u \frac{dv}{dx} + v \frac{du}{dx}$	$\frac{d}{dx}\left(\frac{u}{v}\right) = \frac{v \frac{du}{dx} - u \frac{dv}{dx}}{v^2}$
$\frac{du}{dx} = \frac{du}{dy} \cdot \frac{dy}{dx}$ (Chain Rule)	$\frac{d}{dx}(ax+b)^n = n(ax+b)^{n-1} \cdot a$
(ii) $\frac{d}{dx}(e^x) = e^x$	$\frac{d}{dx}(a^x) = a^x \log_a a$
$\frac{d}{dx}(\log_e x) = 1/x$	$\frac{d}{dx}(\log_a x) = \frac{1}{x \log a}$
(iii) $\frac{d}{dx}(\sin x) = \cos x$	$\frac{d}{dx}(\cos x) = -\sin x$
$\frac{d}{dx}(\tan x) = \sec^2 x$	$\frac{d}{dx}(\cot x) = -\operatorname{cosec}^2 x$
$\frac{d}{dx}(\sec x) = \sec x \tan x$	$\frac{d}{dx}(\operatorname{cosec} x) = -\operatorname{cosec} x \cot x$
(iv) $\frac{d}{dx}(\sin^{-1} x) = \frac{1}{\sqrt{1-x^2}}$	$\frac{d}{dx}(\cos^{-1} x) = -\frac{1}{\sqrt{1-x^2}}$
$\frac{d}{dx}(\tan^{-1} x) = \frac{1}{1+x^2}$	$\frac{d}{dx}(\cot^{-1} x) = \frac{-1}{1+x^2}$
$\frac{d}{dx}(\sec^{-1} x) = \frac{1}{x\sqrt{x^2-1}}$	$\frac{d}{dx}(\operatorname{cosec}^{-1} x) = \frac{-1}{x\sqrt{x^2-1}}$
(v) $\frac{d}{dx}(\sinh x) = \cosh x$	$\frac{d}{dx}(\cosh x) = \sinh x$
$\frac{d}{dx}(\tanh x) = \operatorname{sech}^2 x$	$\frac{d}{dx}(\coth x) = -\operatorname{cosech}^2 x$
(vi) $D^n(ax+b)^m = m(m-1)(m-2)\dots(m-n+1)(ax+b)^{m-n} \cdot a^n$	
$D^n \log(ax+b) = (-1)^{n-1}(n-1)!a^n/(ax+b)^n$	
$D^n(e^{mx}) = m^n e^{mx}$	$D^n(a^{mx}) = m^n (\log a)^n \cdot a^{mx}$
$D^n \begin{bmatrix} \sin(ax+b) \\ \cos(ax+b) \end{bmatrix} = a^n \begin{bmatrix} \sin(ax+b+n\pi/2) \\ \cos(ax+b+n\pi/2) \end{bmatrix}$	
$D^n e^{ax} \begin{bmatrix} \sin(bx+c) \\ \cos(bx+c) \end{bmatrix} = (a^2+b^2)^{n/2} e^{ax} \begin{bmatrix} \sin(bx+c+n\tan^{-1}b/a) \\ \cos(bx+c+n\tan^{-1}b/a) \end{bmatrix}$	

(vii) Leibnitz theorem: $(uv)_n = u_n + {}^nC_1 u_{n-1} v_1 + {}^nC_2 u_{n-2} v_2 + \dots + {}^nC_r u_{n-r} v_r + \dots + {}^nC_n v_n$

3. (i) Maclaurin's series : $f(x) = f(0) + \frac{x}{1!} f'(0) + \frac{x^2}{2!} f''(0) + \frac{x^3}{3!} f'''(0) + \dots$

(ii) Taylor's series : $f(x+a) = f(a) + \frac{x}{1!} f'(a) + \frac{x^2}{2!} f''(a) + \frac{x^3}{3!} f'''(a) + \dots$

4. Curvature

(i) Radius of curvature $\rho = \frac{(1+y_1^2)^{3/2}}{y_2}, \rho = \frac{(r^2+r_1^2)^{3/2}}{r^2+2r_1^2-rr_2}; \rho = r \frac{dr}{dp}$.

(ii) Centre of curvature : $\bar{x} = x - \frac{y_1(1+y_1^2)}{y_2}, \bar{y} = y + \frac{1}{y_2}(1+y_1^2)$.

(iii) Evolute is the locus of the centre of curvature of a curve. The curve is called the involute of the evolute.

(iv) Envelope of a curve $f(x, y, \alpha) = 0$ is the 'alpha' eliminant from

$$f(x, y, \alpha) = 0 \text{ and } \frac{\partial f}{\partial \alpha}(x, y, \alpha) = 0.$$

The envelope of the normals to a curve is its evolute.

5. Asymptotes

(i) *Asymptotes parallel to x-axis are obtained by equating to zero the coefficient of the highest power of x in the equation, provided this is not merely a constant.*

Asymptotes parallel to y-axis are obtained by equating to zero the coefficient of highest power of y in the equation, provided this is not merely a constant.

(ii) *Oblique asymptotes are obtained as follows:*

Put $x = 1, y = m$ in the highest degrees terms getting $\phi_n(m)$

Put $\phi_n(m) = 0$ and find the values of m .

Find c from $c = -\phi_{n-1}(m)/\phi'_n(m)$

If two values of m are equal, then find c from

$$\frac{c^2}{2} \phi''_n(m) + c\phi'_{n-1}(m) + \phi_{n-2}(m) = 0$$

The asymptotes is $y = mx + c$.

(iii) *Asymptotes of polar curve $1/r = f(\theta)$ is $r \sin(\theta - \alpha) = 1/f'(\alpha)$ where α is a root of $f(\theta) = 0$.*

6. Curve tracing

(i) *A curve is symmetrical about x-axis, if only even powers of y occur in its equation.*

(ii) *A curve is symmetrical about y-axis, if only even powers of x occur in its equation.*

(iii) *A curve is symmetrical about the line $y = x$, if on interchanging x and y, its equation remains unchanged.*

(iv) *A curve passes through the origin, if there is no constant term in its equation.*

(v) *Tangents to curve at the origin are found by equating to zero the lowest degree terms.*

7. Partial Differentiation

(i) *Euler's theorem.* If u is a homogeneous function in x and y of degree n , then

$$x \frac{\partial u}{\partial x} + y \frac{\partial u}{\partial y} = nu; \quad x^2 \frac{\partial^2 u}{\partial x^2} + 2xy \frac{\partial^2 u}{\partial x \partial y} + y^2 \frac{\partial^2 u}{\partial y^2} = n(n-1)u$$

(ii) *Chain rule :* $\frac{du}{dt} = \frac{\partial u}{\partial x} \frac{dx}{dt} + \frac{\partial u}{\partial y} \frac{dy}{dt}$, if $u = f(x, y), x = \phi(t), y = \psi(t)$.

(iii) $\frac{dy}{dx} = -\frac{\partial \phi}{\partial x} / \frac{\partial \phi}{\partial y}$, if $\phi(x, y) = c$

(iv) *Jacobian* $J \left(\frac{u, v}{x, y} \right) = \frac{\partial(u, v)}{\partial(x, y)} = \begin{vmatrix} \frac{\partial u}{\partial x} & \frac{\partial u}{\partial y} \\ \frac{\partial v}{\partial x} & \frac{\partial v}{\partial y} \end{vmatrix}$

If $J = \partial(u, v)/\partial(x, y)$ and $J' = \partial(x, y)/\partial(u, v)$, then $JJ' = 1$

$$\frac{\partial(u, v)}{\partial(x, y)} = \frac{\partial(u, v)}{\partial(r, s)} \cdot \frac{\partial(r, s)}{\partial(x, y)}$$

(v) *Taylor's series :* $f(a+h, b+k) = f(a, b) + \left(h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right) f + \frac{1}{2!} \left(h \frac{\partial}{\partial x} + k \frac{\partial}{\partial y} \right)^2 f + \dots$

(vi) *Maxima Minima* (a) $\frac{\partial f}{\partial x} = 0, \frac{\partial f}{\partial y} = 0$

(b) $\frac{\partial^2 f}{\partial x^2} \frac{\partial^2 f}{\partial y^2} > \frac{\partial^2 f}{\partial x \partial y}, \frac{\partial^2 f}{\partial x^2} < 0$ for maximum $\frac{\partial^2 f}{\partial x^2} > 0$ for minimum.

(vii) *Leibnitz's Rule* $\frac{d}{d\alpha} \left\{ \int_a^b f(x, \alpha) dx \right\} = \int_a^b \frac{\partial f(x, \alpha)}{\partial \alpha} dx$

where $f(x, \alpha)$ and $\frac{\partial f(x, \alpha)}{\partial \alpha}$ are continuous functions of x and α and a, b are constants.

VII. INTEGRAL CALCULUS

1. Integration

(i) $\int x^n dx = \frac{x^{n+1}}{n+1}$ ($n \neq -1$)

$\int \frac{1}{x} dx = \log_e x$

$\int e^x dx = e^x$

$\int a^x dx = a^x / \log_e a$

(ii) $\int \sin x dx = -\cos x$

$\int \cos x dx = \sin x$

$\int \tan x dx = -\log \cos x$

$\int \cot x dx = \log \sin x$

$\int \sec x dx = \log (\sec x + \tan x)$

$\int \operatorname{cosec} x dx = \log (\operatorname{cosec} x - \cot x)$

$\int \sec^2 x dx = \tan x$

$\int \operatorname{cosec}^2 x dx = -\cot x$

(iii) $\int \frac{dx}{a^2 + x^2} = \frac{1}{a} \tan^{-1} \frac{x}{a}$

$\int \frac{dx}{\sqrt{a^2 - x^2}} = \sin^{-1} \frac{x}{a}$

$\int \frac{dx}{a^2 - x^2} = \frac{1}{2a} \log \frac{a+x}{a-x}$

$\int \frac{dx}{\sqrt{a^2 + x^2}} = \sinh^{-1} \frac{x}{a}$

$\int \frac{dx}{x^2 - a^2} = \frac{1}{2a} \log \frac{x-a}{x+a}$

$\int \frac{dx}{\sqrt{x^2 - a^2}} = \cosh^{-1} \frac{x}{a}$

(iv) $\int \sqrt{a^2 - x^2} dx = \frac{x\sqrt{(a^2 - x^2)}}{2} + \frac{a^2}{2} \sin^{-1} \frac{x}{a}$

$\int \sqrt{a^2 + x^2} dx = \frac{x\sqrt{(a^2 + x^2)}}{2} + \frac{a^2}{2} \sinh^{-1} \frac{x}{a}$

$\int \sqrt{x^2 - a^2} dx = \frac{x\sqrt{(x^2 - a^2)}}{2} - \frac{a^2}{2} \cosh^{-1} \frac{x}{a}$

(v) $\int e^{ax} \sin bx dx = \frac{e^{ax}}{a^2 + b^2} (a \sin bx - b \cos bx)$

$\int e^{ax} \cos bx dx = \frac{e^{ax}}{a^2 + b^2} (a \cos bx + b \sin bx)$

(vi) $\int \sinh x dx = \cosh x$

$\int \cosh x dx = \sinh x$

$\int \tanh x dx = \log \cosh x$

$\int \coth x dx = \log \sinh x$

$\int \operatorname{sech}^2 x dx = \tanh x$

$\int \operatorname{cosech}^2 x dx = -\coth x$

(vii) $\int_0^{\pi/2} \sin^n x dx = \int_0^{\pi/2} \cos^n x dx = \frac{(n-1)(n-3)(n-5)\dots}{n(n-2)(n-4)\dots} \times \left(\frac{\pi}{2}, \text{only if } n \text{ is even} \right)$

$\int_0^{\pi/2} \sin^m x \cos^n x dx = \frac{(m-1)(m-3)\dots \times (n-1)(n-3)\dots}{(m+n)(m+n-2)(m+n-4)\dots} \times \left(\frac{\pi}{2}, \text{only if both } m \text{ and } n \text{ are even} \right)$

(viii) $\int_0^a f(x) dx = \int_0^a f(a-x) dx$

$\int_{-a}^a f(x) dx = 2 \int_0^a f(x) dx,$ if $f(x)$ is an even function

$= 0,$ if $f(x)$ is an odd function.

$\int_0^{2a} f(x) dx = 2 \int_0^a f(x) dx,$ if $f(2a-x) = f(x)$

$= 0,$ if $f(2a-x) = -f(x).$

2. Lengths of curves

- (i) Length of curve $y = f(x)$ between $x = a$, $x = b$ is $\int_a^b \sqrt{\left\{1 + \left(\frac{dy}{dx}\right)^2\right\}} dx$
- (ii) Length of curve $x = f(y)$ between $y = a$, $y = b$ is $\int_a^b \sqrt{\left\{1 + \left(\frac{dx}{dy}\right)^2\right\}} dy$
- (iii) Length of curve $x = f(t)$, $y = \phi(t)$ between $t = t_1$, $t = t_2$ is $\int_{t_1}^{t_2} \sqrt{\left\{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2\right\}} dt$
- (iv) Length of curve $r = f(\theta)$ between $\theta = \alpha$, $\theta = \beta$ is $\int_{\alpha}^{\beta} \sqrt{\left\{r^2 + \left(\frac{dr}{d\theta}\right)^2\right\}} d\theta$

3. Areas of curves

- (i) Area bounded by $y = f(x)$, x-axis and $x = a$, $x = b$ is $\int_a^b y dx$
- (ii) Area bounded by $x = f(y)$, y-axis and $y = a$, $y = b$ is $\int_a^b x dy$
- (iii) Area bounded by $r = f(\theta)$ and lines $\theta = \alpha$, $\theta = \beta$ is $\frac{1}{2} \int_{\alpha}^{\beta} r^2 d\theta$

4. Volumes of revolution

- (i) Volume of revolution about x-axis of area bounded by $y = f(x)$, x-axis and $x = a$, $x = b$ is $\int_a^b \pi y^2 dx$
- (ii) Volume of revolution about y-axis of area bounded by $x = f(y)$, y-axis and $y = a$, $y = b$ is $\int_a^b \pi x^2 dy$
- (iii) Volume of revolution bounded by $r = f(\theta)$ and $\theta = \alpha$, $\theta = \beta$
 - (a) about OX = $\int_{\alpha}^{\beta} \frac{2\pi}{3} r^3 \sin \theta d\theta$
 - (b) about OY = $\int_{\alpha}^{\beta} \frac{2\pi}{3} r^3 \cos \theta d\theta$

5. Surface areas of revolution

- (i) Surface area of revolution about x-axis of curve $y = f(x)$ from $x = a$ to $x = b$ is $S = \int_{x=a}^{x=b} 2\pi y ds$
- Cartesian form : $S = \int_a^b 2\pi y \frac{ds}{dx} dx$ where $\frac{ds}{dx} = \sqrt{\left\{1 + \left(\frac{dy}{dx}\right)^2\right\}}$
- Parametric form : $S = \int 2\pi y \frac{ds}{dt} dt$ where $\frac{ds}{dt} = \sqrt{\left\{\left(\frac{dx}{dt}\right)^2 + \left(\frac{dy}{dt}\right)^2\right\}}$
- Polar form : $S = \int 2\pi r \frac{ds}{d\theta} d\theta$ where $\frac{ds}{d\theta} = \sqrt{\left\{r^2 + \left(\frac{dr}{d\theta}\right)^2\right\}}$

- (ii) Surface area of revolution about y-axis is $\int 2\pi x ds$.

6. Multiple integrals

- (i) Area = $\int_{x_1}^{x_2} \int_{y_1}^{y_2} dx dy$; Volume = $\int_{x_1}^{x_2} \int_{y_1}^{y_2} z dx dy$ or $\int_{x_1}^{x_2} \int_{y_1}^{y_2} \int_{z_1}^{z_2} dx dy dz$
- (ii) C.G. of a plane lamina: $\bar{x} = \frac{\iint x \rho dx dy}{\iint \rho dx dy}$, $\bar{y} = \frac{\iint y \rho dx dy}{\iint \rho dx dy}$

$$\text{C.G. of a solid } \bar{x} = \frac{\iiint_V xp \, dx \, dy \, dz}{\iiint_V \rho \, dx \, dy \, dz}, \bar{y} = \frac{\iiint_V yp \, dx \, dy \, dz}{\iiint_V \rho \, dx \, dy \, dz}, \bar{z} = \frac{\iiint_V zp \, dx \, dy \, dz}{\iiint_V \rho \, dx \, dy \, dz}$$

$$(iii) \text{ Centre of pressure } \bar{x} = \frac{\iint_A px \, dx \, dy}{\iint_A p \, dx \, dy}, \bar{y} = \frac{\iint_A py \, dx \, dy}{\iint_A p \, dx \, dy}$$

$$(iv) \text{ M.I. about } x\text{-axis i.e., } I_x = \iiint_V \rho (y^2 + z^2) \, dx \, dy \, dz$$

$$\text{M.I. about } y\text{-axis i.e., } I_y = \iiint_V \rho (z^2 + x^2) \, dx \, dy \, dz$$

$$\text{M.I. about } z\text{-axis i.e., } I_z = \iiint_V \rho (x^2 + y^2) \, dx \, dy \, dz$$

$$7. \text{ Gamma function } \Gamma(n) = \int_0^\infty e^{-x} x^{n-1} \, dx = (n-1)! \quad \Gamma(n+1) = n \Gamma(n) = n! \quad \Gamma(1/2) = \sqrt{\pi}$$

$$\text{Beta function } \beta(m, n) = \int_0^1 x^{m-1} (1-x)^{n-1} \, dx = \frac{\Gamma(m) \Gamma(n)}{\Gamma(m+n)} \quad (m > 0, n > 0)$$

VIII. VECTORS

1. (i) If $\mathbf{R} = x\mathbf{I} + y\mathbf{J} + z\mathbf{K}$ then $r = |\mathbf{R}| = \sqrt{(x^2 + y^2 + z^2)}$

(ii) \vec{PQ} = Position vector of Q – position vector of P .

2. If $\mathbf{A} = a_1\mathbf{I} + a_2\mathbf{J} + a_3\mathbf{K}$, $\mathbf{B} = b_1\mathbf{I} + b_2\mathbf{J} + b_3\mathbf{K}$, then

(i) *Scalar product:* $\mathbf{A} \cdot \mathbf{B} = ab \cos \theta = a_1 b_1 + a_2 b_2 + a_3 b_3$

(ii) *Vector product:* $\mathbf{A} \times \mathbf{B} = ab \sin \theta \hat{\mathbf{N}}$ = Area of the parallelogram having \mathbf{A} and \mathbf{B} as sides

$$= \begin{vmatrix} \mathbf{I} & \mathbf{J} & \mathbf{K} \\ a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \end{vmatrix}$$

(iii) $\mathbf{B} \perp \mathbf{A}$ if $\mathbf{A} \cdot \mathbf{B} = 0$ and \mathbf{A} is parallel to \mathbf{B} if $\mathbf{A} \times \mathbf{B} = 0$

$$3. (i) \text{ Scalar triple product } [\mathbf{A} \mathbf{B} \mathbf{C}] = \begin{vmatrix} a_1 & a_2 & a_3 \\ b_1 & b_2 & b_3 \\ c_1 & c_2 & c_3 \end{vmatrix} = \text{Volume of parallelopiped}$$

(ii) If $[\mathbf{A} \mathbf{B} \mathbf{C}] = 0$, then \mathbf{A} , \mathbf{B} , \mathbf{C} are coplanar.

$$(iii) \text{ Vector triple product } \mathbf{A} \times (\mathbf{B} \times \mathbf{C}) = (\mathbf{A} \cdot \mathbf{C}) \mathbf{B} - (\mathbf{A} \cdot \mathbf{B}) \mathbf{C} \\ (\mathbf{A} \times \mathbf{B}) \times \mathbf{C} = (\mathbf{C} \cdot \mathbf{A}) \mathbf{B} - (\mathbf{C} \cdot \mathbf{B}) \mathbf{A}$$

$$4. (i) \text{ grad } f = \nabla f = \frac{\partial f}{\partial x} \mathbf{I} + \frac{\partial f}{\partial y} \mathbf{J} + \frac{\partial f}{\partial z} \mathbf{K}$$

$$\text{div } \mathbf{F} = \nabla \cdot \mathbf{F} = \frac{\partial f_1}{\partial x} + \frac{\partial f_2}{\partial y} + \frac{\partial f_3}{\partial z}$$

$$\text{curl } \mathbf{F} = \nabla \times \mathbf{F} = \begin{vmatrix} \mathbf{I} & \mathbf{J} & \mathbf{K} \\ \frac{\partial}{\partial x} & \frac{\partial}{\partial y} & \frac{\partial}{\partial z} \\ f_1 & f_2 & f_3 \end{vmatrix} \quad \text{where } \mathbf{F} = f_1 \mathbf{I} + f_2 \mathbf{J} + f_3 \mathbf{K}$$

(ii) If $\text{div } \mathbf{F} = 0$, then \mathbf{F} is called a *solenoidal vector*.

(iii) If $\text{curl } \mathbf{F} = 0$ then \mathbf{F} is called an *irrotational vector*

5. *Velocity* = $d\mathbf{R}/dt$; *Acceleration* = $d^2\mathbf{R}/dt^2$; *Tangent vector* = $d\mathbf{R}/dt$; *Normal vector* = $\nabla \phi$

$$6. \text{ Green's theorem: } \int_C (\phi \, dx + \psi \, dy) = \iint_D \left(\frac{\partial \psi}{\partial x} - \frac{\partial \phi}{\partial y} \right) dx \, dy$$

Stoke's theorem: $\int_C \mathbf{F} \cdot d\mathbf{R} = \int_S \operatorname{curl} \mathbf{F} \cdot \mathbf{N} ds$

Gauss divergence theorem: $\int_S \mathbf{F} \cdot \mathbf{N} ds = \int_V \operatorname{div} \mathbf{F} dv$

7. Coordinate systems

	Polar coordinates (r, θ)	Cylindrical coordinates (ρ, ϕ, z)	Spherical polar coordinates (r, θ, ϕ)
Coordinate transformations	$x = r \cos \theta$ $y = r \sin \theta$	$x = \rho \cos \phi$ $y = \rho \sin \phi$ $z = z$	$x = r \sin \theta \cos \phi$ $y = r \sin \theta \sin \phi$ $z = r \cos \theta$
Jacobian	$\frac{\partial(x, y)}{\partial(r, \theta)} = r$	$\frac{\partial(x, y, z)}{\partial(\rho, \phi, z)} = \rho$	$\frac{\partial(x, y, z)}{\partial(r, \theta, \phi)} = r^2 \sin \theta$
(Arc-length) ²	$(dx)^2 = (dr)^2 + r^2(d\theta)^2$ $dxdy = r d\theta dr$	$(ds)^2 = (d\rho)^2 + \rho^2(d\phi)^2$ $+ (dz)^2$	$(ds)^2 = (dr)^2 + r^2(d\theta)^2$ $+ (r \sin \theta)^2(d\phi)^2$
Volume-element		$dV = \rho d\rho d\phi dz$	$dV = r^2 \sin \theta dr d\theta d\phi$

IX. DIFFERENTIAL EQUATIONS

1. Equations of first order

(i) *Variables separable* : $f(y) dy/dx = \phi(x)$, $\int f(y) dy = \int \phi(x) dx + c$.

(ii) *Homogeneous equation* $dy/dx = f(x, y)/\phi(x, y)$ where $f(x, y)$ and $\phi(x, y)$ are of the same degree.

Put $y = ux$ so that $dy/dx = u + x du/dx$.

(iii) *Equations reducible to homogenous form* : $\frac{dy}{dx} = \frac{ax + by + c}{a'x + b'y + c'}$

When $a/a' \neq b/b'$, put $x = X + h, y = Y + k$

When $a/a' = b/b'$, put $ax + by = t$.

(iv) *Leibnitz's linear equation* : $\frac{dy}{dx} + Py = Q$ where P, Q are functions of x .

I.F. = $e^{\int P dx}$, then solution is $y(\text{I.F.}) = \int Q(\text{I.F.}) dx + c$.

(v) *Bernoulli's equation* : $dy/dx + Py = Qy^n$, reducible to Leibnitz's equation by writing it as

$y^{-n} \frac{dy}{dx} + Py^{1-n} = Q$ and putting $y^{1-n} = z$.

(vi) *Exact equation* : $M(x, y) dx + N(x, y) dy = 0$

Solution is $\int_{(y \text{ const.})} M dx + \int (\text{terms of } N \text{ not containing } x) dy = c$, provided $\partial M / \partial y = \partial N / \partial x$.

(vii) *Clairaut's equation* : $y = px + f(p)$ where $p = dy/dx$.

Solution is obtained on replacing p by c .

2. Linear equations with constant coefficients

$$\frac{d^n y}{dx^n} + k_1 \frac{d^{n-1} y}{dx^{n-1}} + \dots + k_{n-1} \frac{dy}{dx} + k_n y = X$$

Symbolic form : $(D^n + k_1 D^{n-1} + \dots + k_{n-1} D + k_n) y = X$.

I. To find C.F.

Roots of A.E.	C.F.
(i) m_1, m_2, m_3, \dots	$c_1 e^{m_1 x} + c_2 e^{m_2 x} + c_3 e^{m_3 x} + \dots$
(ii) m_1, m_1, m_3, \dots	$(c_1 + c_2 x) e^{m_1 x} + c_3 e^{m_3 x} + \dots$
(iii) $\alpha + i\beta, \alpha - i\beta, m_3, \dots$	$e^{\alpha x} (c_1 \cos \beta x + c_2 \sin \beta x) + c_3 e^{m_3 x} + \dots$
(iv) $\alpha \pm i\beta, \alpha \pm i\beta, m_3, \dots$	$e^{\alpha x} [(c_1 + c_2 x) \cos \beta x + (c_3 + c_4 x) \sin \beta x] + c_5 e^{m_3 x} + \dots$

II. To find P.I.

$$(i) X = e^{ax}, \quad \text{P.I.} = \frac{1}{f(D)} e^{ax}, \text{ put } D = a, \quad [f(a) \neq 0]$$

$$= x \frac{1}{f'(D)} e^{ax}, \text{ put } D = a, \quad [f(a) = 0, f'(a) \neq 0]$$

$$= x^2 \frac{1}{f''(D)} e^{ax}, \text{ put } D = a, \quad [f'(a) = 0, f''(a) \neq 0]$$

(ii) $X = \sin(ax + b)$ or $\cos(ax + b)$

$$\text{P.I.} = \frac{1}{\phi(D^2)} \sin(ax + b) \text{ [or } \cos(ax + b)], \text{ put } D^2 = -a^2, \quad [\phi(-a^2) \neq 0]$$

$$= x \frac{1}{\phi(D^2)} \sin(ax + b) \text{ [or } (\cos ax + b)], \text{ put } D^2 = -a^2, \quad [\phi(-a^2) = 0, \phi'(-a^2) \neq 0]$$

$$= x^2 \frac{1}{\phi''(D^2)} \sin(ax + b) \text{ [or } \cos(ax + b)], \text{ put } D^2 = -a^2, \quad [\phi'(-a^2) = 0, \phi''(-a^2) \neq 0]$$

(iii) $X = x^m$, P.I. = $\frac{1}{f(D)} x^m = [f(D)]^{-1} x^m$. Expand $[f(D)]^{-1}$ in ascending powers of D as for as D^n and operate on x^m term by term.

$$(iv) X = e^{ax} V, \text{ P.I.} = \frac{1}{f(D)} e^{ax} V = e^{ax} \frac{1}{f(D+a)} V.$$

III. Complete Solution : C.S. is $y = \text{C.F.} + \text{P.I.}$

3. Homogeneous linear equation : $x^3 \frac{d^3y}{dx^3} + k_1 x^2 \frac{d^2y}{dx^2} + k_2 x \frac{dy}{dx} + k_3 y = X$

reduces to linear equation with constant coefficients by putting

$$x = e^t, x \frac{dy}{dx} = Dy, x^2 \frac{d^2y}{dx^2} = D(D-1)y, x^3 \frac{d^3y}{dx^3} = D(D-1)(D-2)y$$

4. Lagrange's linear partial differential equation

$Pp + Qq = R$, P, Q, R being functions of x, y, z .

To solve it (i) form the subsidiary equations $\frac{dx}{P} = \frac{dy}{Q} = \frac{dz}{R}$

(ii) solve these equations giving $u = a, v = b$.

(iii) Complete solution is $\phi(u, v) = 0$ or $u = f(v)$.

5. Homogeneous linear partial differential equations with constant coefficients

$$\frac{\partial^n z}{\partial x^n} + k_1 \frac{\partial^n z}{\partial x^{n-1} \partial y} + \dots + k_n \frac{\partial^n z}{\partial y^n} = F(x, y)$$

Symbolic form : $(D^n + k_1 D^{n-1} D' + \dots + k_n D^m)z = F(x, y)$

To find C.F.

Roots of A.E.	C.F.
(i) m_1, m_2, m_3, \dots	$f_1(y + m_1x) + f_2(y + m_2x) + f_3(y + m_3x) + \dots$
(ii) m_1, m_1, m_3, \dots	$f_1(y + m_1x) + xf_2(y + m_1x) + f_3(y + m_3x) + \dots$
(iii) m_1, m_1, m_1, \dots	$f_1(y + m_1x) + xf_2(y + m_1x) + x^2f_3(y + m_1x) + \dots$

To find P.I.

(i) $F(x, y) = e^{ax+by}$, P.I. = $\frac{1}{f(D, D')} e^{ax+by}$, put $D = a$, $D' = b$.

(ii) $F(x, y) = \sin(mx+ny)$ or $\cos(mx+ny)$

$$\text{P.I.} = \frac{1}{f(D^2, DD', D'^2)} \sin \text{ or } \cos (mx+ny), \text{ put } D^2 = -m^2, DD' = -mn, D'^2 = -n^2$$

(iii) $F(x, y) = x^m y^n$, P.I. = $[f(D, D')]^{-1} x^m y^n$. Expand $[f(D, D')]^{-1}$ and operate on $x^m y^n$.

(iv) $F(x, y)$ is any function of x and y , P.I. = $\frac{1}{f(D, D')} F(x, y)$.

Resolve $1/f(D, D')$ into partial fractions considering $f(D, D')$ as a function of D alone and operate each

$$\text{partial fraction on } F(x, y) \text{ remembering that } \frac{1}{D - mD'} F(x, y) = \int F(x, c - mx) dx.$$

Complete solution: C.S. is $y = \text{C.F.} + \text{P.I.}$

X. INFINITE SERIES

- Basic test:** If $\lim_{n \rightarrow \infty} u_n \neq 0$ then the series $\sum u_n$ diverges.
- G.P. Series:** $1 + r + r^2 + r^3 + \dots$ converge if $|r| < 1$; diverges if $r \geq 1$ and oscillates if $r \leq -1$.
- p-series:** $\frac{1}{1^p} + \frac{1}{2^p} + \frac{1}{3^p} + \dots$ converge for $p > 1$; diverges for $p \leq 1$.
- Comparison test:** If two positive term series $\sum u_n$ and $\sum v_n$ be such that $\lim_{n \rightarrow \infty} \frac{u_n}{v_n} = \text{finite quantity} (\neq 0)$, then $\sum u_n$ and $\sum v_n$ converge or diverge together.
- Ratio test:** In the positive term series $\sum u_n$, if $\lim_{n \rightarrow \infty} \frac{u_n}{u_{n+1}} = k$, then the series converges for $k > 1$, diverges for $k < 1$ and fails for $k = 1$.
- Raabes' test:** In the positive term series $\sum u_n$, if $\lim_{n \rightarrow \infty} n \left(\frac{u_n}{u_{n+1}} - 1 \right) = k$, then the series converges for $k > 1$, diverges for $k < 1$ and fails for $k = 1$.
- Logarithmic test:** In the positive term series $\sum u_n$, if $\lim_{n \rightarrow \infty} \left(n \log \frac{u_n}{u_{n+1}} \right) = k$, then the series converges for $k > 1$, diverges for $k < 1$ and fails for $k = 1$.
- If u_n/u_{n+1} does not involve n as an exponent or a logarithm, then the series $\sum u_n$ diverges.
- Cauchy's root test:** In a positive term series $\sum u_n$ if $\lim_{n \rightarrow \infty} (u_n)^{1/n} = \lambda$, then the series converges for $\lambda < 1$, diverges for $\lambda > 1$ and fails for $\lambda = 1$.
- Integral test:** A positive term series $\sum f(n)$ converges or diverges according as $\int_1^\infty f(x) dx$ is finite or infinite where $f(n)$ is continuous in $1 < x < \infty$ and decreases as n increases.
- Leibnitz's test for alternating series:** An alternating series $u_1 - u_2 + u_3 - u_4 + \dots$ converges if each term is numerically less than the previous term and $\lim_{n \rightarrow \infty} u_n = 0$.
if $\lim_{n \rightarrow \infty} u_n \neq 0$, then the given series is oscillatory.

12. *General Ratio test:* In an arbitrary term series $\sum u_n$ if $Lt \frac{|u_{n+1}|}{|u_n|} = |k|$, then $\sum u_n$ is absolutely convergent if $|k| < 1$ and divergent if $|k| > 1$ and the test fails if $|k| = 1$.

XI. FOURIER SERIES

1. $f(x) = \frac{1}{2} a_0 + a_1 \cos x + a_2 \cos 2x + \dots + b_1 \sin x + b_2 \sin 2x + \dots$ in $(0, 2\pi)$.

where $a_0 = \frac{1}{\pi} \int_0^{2\pi} f(x) dx$, $a_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \cos nx dx$, $b_n = \frac{1}{\pi} \int_0^{2\pi} f(x) \sin nx dx$

2. $f(x) = \frac{1}{2} a_0 + \sum_{n=1}^{\infty} a_n \cos nx + \sum_{n=1}^{\infty} b_n \sin nx$ in any interval $(0, 2c)$,

where $a_0 = \frac{1}{c} \int_0^{2c} f(x) dx$, $a_n = \frac{1}{c} \int_0^{2c} f(x) \cos \frac{n\pi x}{c} dx$, $b_n = \frac{1}{c} \int_0^c f(x) \sin \frac{n\pi x}{c} dx$

3. For even function $f(x)$, Fourier expansion contains only cosine terms.

i.e., $a_0 = \frac{2}{c} \int_0^c f(x) dx$, $a_n = \frac{2}{c} \int_0^c f(x) \cos \frac{n\pi x}{c} dx$, $b_n = 0$.

For odd function $f(x)$, Fourier expansion contains only sine terms.

i.e., $a_0 = 0$, $a_n = 0$, $b_n = \frac{2}{c} \int_0^c f(x) \sin \frac{n\pi x}{c} dx$.

XII. TRANSFORMS

1. Laplace Transforms, $L(f(t)) = \int_0^{\infty} e^{-st} f(t) dt$

(i) $L(1) = \frac{1}{s}$

(ii) $L(t^n) = \frac{n!}{s^{n+1}}$

(iii) $L(e^{at}) = \frac{1}{s-a}$

(iv) $L(\sin at) = \frac{a}{s^2 + a^2}$

(v) $L(\cos at) = \frac{s}{s^2 + a^2}$

(vi) $L(\sinh at) = \frac{a}{s^2 - a^2}$

(vii) $L(\cosh at) = \frac{s}{s^2 - a^2}$

(viii) $L(e^{at} f(t)) = F(s-a)$

(ix) $L(f'(t)) = sL(f(t)) - f(0)$

(x) $L[t^n f(t)] = (-1)^n \frac{d^n}{ds^n} [F(s)]$

(xi) $L\left[\frac{1}{t} f(t)\right] = \int_s^{\infty} F(s) ds$

(xii) $u(t-a) = \begin{cases} 0 & \text{when } t < a \\ 1 & \text{when } t > a \end{cases}$

(xiii) $L[u(t-a)] = \frac{e^{-as}}{s}$

(xiv) $L\delta(t-a) = e^{-as}$

(xv) $L[f(t)] = \frac{\int_0^T e^{-st} f(t) dt}{1 - e^{-sT}}$ where $f(t)$ is a periodic function of period T .

2. Inverse Laplace Transforms

(i) $L^{-1}\left(\frac{1}{s}\right) = 1$

(ii) $L^{-1}\left(\frac{1}{s^n}\right) = \frac{t^{n-1}}{(n-1)!}$

(iii) $L^{-1}\left(\frac{1}{s-a}\right) = e^{at}$

(iv) $L^{-1}\left(\frac{1}{s^2 + a^2}\right) = \frac{1}{a} \sin at$

(v) $L^{-1}\left(\frac{s}{s^2 + a^2}\right) = \cos at$

(vi) $L^{-1}\left(\frac{s}{s^2 - a^2}\right) = \frac{1}{a} \sinh at$

$$(vii) L^{-1} \left(\frac{s}{s^2 - a^2} \right) = \cosh at.$$

$$(viii) L^{-1} \left(\frac{s}{(s^2 + a^2)^2} \right) = \frac{1}{2a} t \sin at$$

$$(ix) L^{-1} \left[\frac{s^2 - a^2}{(s^2 + a^2)^2} \right] = t \cos at.$$

3. Fourier Transforms : $F(s) = \int_{-\infty}^{\infty} f(t) e^{ist} dt$

Fourier sine transform : $F_s(s) = \int_0^{\infty} f(t) \sin st dt$

Fourier cosine transform : $F_c(s) = \int_0^{\infty} f(t) \cos st dt$

$$F \left(\frac{\partial^2 u}{\partial x^2} \right) = -s^2 F(u).$$

4. Z-Transforms : $Z(u_n) = \sum_{n=0}^{\infty} u_n z^{-n}$

$$(i) Z(1) = \frac{z}{z-1}$$

$$(ii) Z(n) = \frac{z}{(z-1)^2}$$

$$(iii) Z(n^2) = \frac{z^2 + z}{(z-1)^3}$$

$$(iv) Z(a^n) = \frac{z}{z-a}$$

$$(v) Z(na^n) = \frac{az}{(z-a)^2}$$

$$(vi) Z(\sin n\theta) = \frac{z \sin \theta}{z^2 - 2z \cos \theta + 1}$$

$$(vii) Z(\cos n\theta) = \frac{z(z - \cos \theta)}{z^2 - 2z \cos \theta + 1}$$

$$(viii) Z(\sinh n\theta) = \frac{z \sinh \theta}{z^2 - 2z \cosh \theta + 1}$$

$$(ix) Z(\cosh n\theta) = \frac{z(z - \cosh \theta)}{z^2 - 2z \cosh \theta + 1}$$

XIII. STATISTICS AND PROBABILITY

$$1. A.M. \bar{x} = \frac{\sum f_i x_i}{\sum f_i}$$

$$2. S.D. \sigma = \sqrt{\frac{\sum f_i (x_i - \bar{x})^2}{\sum f_i}}$$

$$3. Moments about the mean : \mu_0 = 1, \mu_1 = 0, \mu_2 = \sigma^2, \mu_r = \frac{\sum f_i (x_i - \bar{x})^r}{\sum f_i}$$

4. Coeff. of skewness = (mean - mode)/σ which lies between -1 and 1.

5. Kurtosis : $\beta_2 = \mu_4/\mu_2^2$.

$$6. \text{Coeff. of correlation } r = \frac{n \sum d_x d_y - \sum d_x \sum d_y}{\sqrt{[(n \sum d_x^2 - (\sum d_x)^2)(n \sum d_y^2 - (\sum d_y)^2)]}}; -1 < r < 1$$

$$7. \text{Line of regression of } y \text{ on } x : y - \bar{y} = r \frac{\sigma_y}{\sigma_x} (x - \bar{x})$$

$$\text{Line of regression of } x \text{ on } y : x - \bar{x} = \frac{r \sigma_x}{\sigma_y} (y - \bar{y})$$

$$8. \text{Probability } p(A) = \frac{\text{No. of ways favourable to } A}{\text{Total no. of equally likely ways}}, p + q = 1.$$

$$(i) p(A \text{ or } B) = p(A) + p(B),$$

$$(ii) p(A \text{ and } B) = p(A) \cdot p(B)$$

9. Binomial distribution : $p(r) = {}^n C_r p^r q^{n-r}$

Mean = np , Variance (σ^2) = npq

10. Poisson distribution : $p(r) = \frac{m^r}{r!} e^{-m}$

Mean = m , Variance (σ^2) = m .

11. Normal distribution : $f(x) = \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{(x-\mu)^2}{2\sigma^2}}$, Standard variate = $\frac{x-\mu}{\sigma}$

(i) Probable error $\lambda = 0.6745 \sigma$.

(ii) 68% of values lie between $x = \mu - \sigma$ and $x = \mu + \sigma$.

95% of values lie between $x = \mu - 1.96 \sigma$ and $x = \mu + 1.96 \sigma$

99% of values lie between $x = \mu - 2.58 \sigma$ and $x = \mu + 2.58 \sigma$

XIV. NUMERICAL TECHNIQUES

1. Solution of equations

(i) Bisection method : $x_n = \frac{1}{2}(x_{n-1} + x_{n-2})$

(ii) Method of False position : $x_2 = x_0 - \frac{x_1 - x_0}{f(x_1) - f(x_0)} f(x_0)$.

(iii) Newton-Raphson method : $x_{n+1} = x_n - \frac{f(x_n)}{f'(x_n)}$

(iv) Iterative formula to find $1/N$ is $x_{n+1} = x_n(2 - Nx_n)$

(v) Iterative formula to find \sqrt{N} is $x_{n+1} = \frac{1}{2}(x_n + N/x_n)$

2. Solution of Linear Simultaneous equations

(i) Matrix inversion method. For the equations

$$a_1x + b_1y + c_1z = d_1, a_2x + b_2y + c_2z = d_2, a_3x + b_3y + c_3z = d_3$$

if $A = \begin{vmatrix} a_1 & b_1 & c_1 \\ a_2 & b_2 & c_2 \\ a_3 & b_3 & c_3 \end{vmatrix}, X = \begin{bmatrix} x \\ y \\ z \end{bmatrix}$ and $D = \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}$

then $\begin{bmatrix} x \\ y \\ z \end{bmatrix} = \frac{1}{|A|} \begin{vmatrix} A_1 & A_2 & A_3 \\ B_1 & B_2 & B_3 \\ C_1 & C_2 & C_3 \end{vmatrix} \times \begin{bmatrix} d_1 \\ d_2 \\ d_3 \end{bmatrix}$

where A_1, B_1 , etc., are the co-factors of a_1, b_1 , etc., in the determinant $|A|$.

(ii) Gauss-elimination method. In this method the coefficient matrix is transformed to upper triangular matrix.

(iii) Gauss-Jordan method. In this method the coefficient matrix is transformed to diagonal matrix.

(iv) Gauss-Jordan method of finding the inverse of a matrix A . The matrices A and I are written side by side and the same row transformations are performed on both till A is reduced to I . Then the other matrix represents A^{-1} .

3. Finite differences and Interpolation

(i) Forward differences: $\Delta y_r = y_{r+1} - y_r$

Backward differences: $\bar{\Delta}y_r = y_r - y_{r-1}$

Central differences: $\delta y_{n-1/2} = y_n - y_{n-1}$

(ii) Relations between operations :

$$\Delta = E - 1; \nabla = 1 - E^{-1}; \delta = E^{1/2} - E^{-1/2}$$

$$\mu = \frac{1}{2}(E^{1/2} + E^{-1/2}); \Delta = EV = \nabla E = \delta E^{1/2}; E = e^{hD}$$

(iii) Factorial notation $|x|^r = x(x-1)(x-2)\dots(x-r+1)$.

Factorial polynomial $[x]^n = x(x-h)(x-2h)\dots(x-nh)$

(iv) *Newton's forward interpolation formula*

$$y_p = y_0 + p \Delta y_0 + \frac{p(p-1)}{2!} \Delta^2 y_0 + \frac{p(p-1)(p-2)}{3!} \Delta^3 y_0 + \dots \text{ where } p = (x - x_0)/h.$$

(v) *Newton's backward interpolation formula:*

$$y_p = y_n + p \nabla y_n + \frac{p(p+1)}{2!} \nabla^2 y_n + \frac{p(p+1)(p+2)}{3!} \nabla^3 y_n + \dots \text{ where } p = (x - x_n)/h.$$

(vi) *Stirling's formula:*

$$y_p = y_0 + p \left(\frac{\Delta y_0 + \Delta y_{-1}}{2} \right) + \frac{p^2}{2!} \Delta^2 y_{-1} + \frac{p(p^2-1)}{3!} \left(\frac{\Delta^3 y_{-1} + \Delta^3 y_{-2}}{2} \right) + \frac{p^2(p^2-1)}{4!} \Delta^4 y_{-2} + \dots$$

(vii) *Bessel's formula:*

$$\begin{aligned} y_p = y_0 + p \Delta y_0 + \frac{p(p-1)}{2!} \frac{\Delta^2 y_{-1} + \Delta^2 y_0}{2} + \frac{\left(p - \frac{1}{2} \right) p(p-1)}{3!} \Delta^3 y_{-1} \\ + \frac{(p+1)p(p-1)(p-2)}{4!} \frac{\Delta^4 y_{-2} + \Delta^4 y_{-1}}{2} + \dots \end{aligned}$$

(viii) *Lagrange's interpolation formula:*

$$\begin{aligned} y = \frac{(x - x_1)(x - x_2) \dots (x - x_n)}{(x_0 - x_1)(x_0 - x_2) \dots (x_0 - x_n)} y_0 + \frac{(x - x_0)(x - x_2) \dots (x - x_n)}{(x_1 - x_0)(x_1 - x_2) \dots (x_1 - x_n)} y_1 + \dots + \\ \frac{(x - x_0)(x - x_1) \dots (x - x_{n-1})}{(x_n - x_0)(x_n - x_1) \dots (x_n - x_{n-1})} y_n \end{aligned}$$

(ix) *Newton's divided difference formula*

$$y = f(x) = y_0 + (x - x_0) [x_0, x_1] + (x - x_0)(x - x_1) [x_0, x_1, x_2] + (x - x_0)(x - x_1)(x - x_2) [x_0, x_1, x_2, x_3] + \dots$$

$$\text{where } [x_0, x_1] = \frac{y_1 - y_0}{x_1 - x_0}, [x_0, x_1, x_2] = \frac{[x_1, x_2] - [x_0, x_1]}{x_2 - x_0} \text{ and so on.}$$

4. Numerical differentiation

(i) *Forward difference formulae:*

$$\left(\frac{dy}{dx} \right)_{x_0} = \frac{1}{h} \left[\Delta y_0 - \frac{1}{2} \Delta^2 y_0 + \frac{1}{3} \Delta^3 y_0 - \frac{1}{4} \Delta^4 y_0 + \dots \right]$$

$$\left(\frac{d^2y}{dx^2} \right)_{x_0} = \frac{1}{h^2} \left[\Delta^2 y_0 - \Delta^3 y_0 + \frac{11}{12} \Delta^4 y_0 + \dots \right] \text{ and so on.}$$

(ii) *Backward difference formulae:*

$$\left(\frac{dy}{dx} \right)_{x_n} = \frac{1}{h} \left[\nabla y_0 + \frac{1}{2} \nabla^2 y_0 + \frac{1}{3} \nabla^3 y_0 + \frac{1}{4} \nabla^4 y_0 + \dots \right]$$

$$\left(\frac{d^2y}{dx^2} \right)_{x_n} = \frac{1}{h^2} \left[\nabla^2 y_0 + \nabla^3 y_0 + \frac{11}{12} \nabla^4 y_0 + \dots \right] \text{ and so on.}$$

(iii) *Central difference formulae:*

$$\left(\frac{dy}{dx} \right)_{x_c} = \frac{1}{h} \left[\frac{\Delta y_0 + \Delta y_{-1}}{2} - \frac{1}{6} \frac{\Delta^3 y_{-1} + \Delta^3 y_{-2}}{2} + \frac{1}{30} \frac{\Delta^5 y_{-2} + \Delta^5 y_{-3}}{2} + \dots \right]$$

$$\left(\frac{d^2y}{dx^2} \right)_{x_c} = \frac{1}{h^2} \left[\Delta^2 y_{-1} - \frac{1}{12} \Delta^4 y_{-2} + \frac{1}{90} \Delta^6 y_{-3} + \dots \right]$$

5. Numerical integration

(i) *Trapezoidal rule:*

$$\int_{x_0}^{x_0 + nh} f(x) dx = \frac{h}{2} [(y_0 + y_n) + 2(y_1 + y_2 + \dots + y_{n-1})]$$

(ii) *Simpson's 1/3 th rule:*

$$\int_{x_0}^{x_0 + nh} f(x) dx = \frac{h}{3} [(y_0 + y_n) + 4(y_1 + y_3 + \dots + y_{n-1}) + 2(y_2 + y_4 + \dots + y_{n-2})]$$

(Number of sub intervals should be taken as even)

(iii) *Simpson's 3/8 th rule:*

$$\int_{x_0}^{x_0 + nh} f(x) dx = \frac{3h}{8} [(y_0 + y_n) + 3(y_1 + y_2 + y_4 + y_5 + \dots + y_{n-1}) + 2(y_3 + y_5 + \dots + y_{n-2})]$$

(Number of sub-intervals should be taken as a multiple of 3)

(iv) *Weddle's rule:*

$$\int_{x_0}^{x_0 + nh} f(x) dx = \frac{3h}{10} [y_0 + 5y_1 + y_2 + 6y_3 + y_4 + 5y_5 + 2y_6 + 5y_7 + \dots]$$

(Number of sub-intervals should be taken as multiple of 6)

6. Numerical solution of ordinary differential equations

(i) *Picard's method:* $y_1 = y_0 + \int_{x_0}^x (x, y_0) dx$

$$y_2 = y_0 + \int_{x_0}^x f(x, y_1) dx \text{ etc.}$$

(ii) *Taylor's method:*

$$y = y_0 + (x - x_0)(y)_0 + \frac{(x - x_0)^2}{2!} (y'')_0 + \frac{(x - x_0)^3}{3!} (y''')_0 + \dots$$

(iii) *Euler's method:* $y_2 = y_1 + h f(x_0 + h, y_1)$

Repeat this process till y_2 is stationary. Then calculate y_3 and so on.

(iv) *Modified Euler's method:* $y_2 = y_1 + \frac{1}{2} [f(x_0 + h, y_1) + f(x_0 + 2h, y_2)]$

Repeat this step till y_2 is stationary. Then calculate y_3 and so on.

(v) *Runge Kutta method:* $y_1 = y_0 + h$ where $h = \frac{1}{6}(k_1 + 2k_2, 2k_3 + k_4)$

such that $k_1 = h f(x_0, y_0)$; $k_2 = h f(x_0 + h/2, y_0 + k_1/2)$

$k_3 = h f(x_0 + h/2, y_0 + k_2/2)$; $k_4 = h f(x_0 + h, y_0 + k_3)$

(vi) *Milne's method*

Predictor formula: $y_4 = y_0 + \frac{4h}{3}(2f_1 - f_2 + 2f_3)$

Corrector formula: $y_4 = y_2 + \frac{h}{3}(f_2 - 4f_3 + f_4)$

(Four prior values are required to find the next values)

(vii) *Adams-Basforth method:*

Predictor formula: $y_1 = y_0 + \frac{h}{24}(55f_0 - 59f_{-1} + 37f_{-2} - 9f_{-3})$

Corrector formula: $y_1 = y_0 + \frac{h}{24}(9f_1 + 19f_0 - 5f_{-1} - f_{-2})$

(Four prior values are required to find the next values)

7. Numerical solution of partial differential equations

(i) *Classification of a second order equations:*

$$A(x, y) \frac{\partial^2 u}{\partial x^2} + B(x, y) \frac{\partial^2 u}{\partial x \partial y} + C(x, y) \frac{\partial^2 u}{\partial y^2} + \left(F(x, y, u) \frac{\partial u}{\partial x} \frac{\partial u}{\partial y} \right) = 0$$

is said to be

elliptic if $B^2 - 4AC < 0$

parabolic if $B^2 - 4AC = 0$

hyperbolic if $B^2 - 4AC > 0$

(ii) Laplace equation: $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = 0$

Standard 5-point formula: $u_{i,j} = \frac{1}{4} [u_{i-1,j} + u_{i+1,j} + u_{i,j+1} + u_{i,j-1}]$

Diagonal 5-point formula: $u_{i,j} = \frac{1}{4} [u_{i-1,j+1} + u_{i+1,j-1} + u_{i+1,j+1} + u_{i-1,j-1}]$

(iii) Poisson's equation: $\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} = f(x, y)$.

Standard 5-point formula:

$$u_{i-1,j} + u_{i+1,j} + u_{i,j+1} + u_{i,j-1} - 4u_{i,j} = h^2 f(ih, jh)$$

(iv) One-dimensional heat equation: $\frac{\partial u}{\partial t} = c^2 \frac{\partial^2 u}{\partial x^2}$

Schmidt formula: $u_{i,j+1} = \alpha u_{i-1,j} + (1 - 2d) u_{i,j} + \alpha u_{i+1,j}$ where $\alpha = kc^2/h^2$
when $\alpha = 1/2$, it reduces to

Bendre-Schmidt relation: $u_{i,j+1} = \frac{1}{2}(u_{i-1,j} + u_{i+1,j})$

(v) Wave equation: $\frac{\partial^2 u}{\partial t^2} = c^2 \frac{\partial^2 u}{\partial x^2}$

Explicit formula for solution is

$$u_{i,j+1} = 2(1 - \alpha^2 c^2) u_{i,j} + \alpha^2 c^2 (u_{i-1,j} + u_{i+1,j}) - u_{i,j-1} \text{ where } \alpha = k/h$$

If α is so chosen that the coefficient of $u_{i,j}$ is zero i.e., $k = h/c$ then the above explicit formula takes the simplified form

$$u_{i,j+1} = u_{i-1,j} + u_{i+1,j} - u_{i,j-1}$$

Answers to Problems

Problems 1.1, page 5

1. $x^4 - 6x^3 + 3x^2 + 42x - 70 = 0$ 2. (i) $-2, 1+3i, 1-3i$ (ii) $2 \pm \sqrt{3}, 3, -5$
 5. Two roots between $(1, 2)$ and $(-3, -4)$
 6. $2, 2, -\frac{1}{3}$ 7. 3 8. $a = 2, b = 1$
 9. $6, 4, -1$ 10. $-4, 2, 6$ 11. $1, 1, 2, 2$
 12. $\frac{1}{2}(3 \pm \sqrt{5}) ; \frac{1}{2}(5 \pm \sqrt{5})$ 13. $1, 4, 7$ 14. $1, \frac{1}{2}, \frac{1}{4}$
 16. (i) $-5, -2, 1, 4$ (ii) $1, -2, 4, -8$ 17. (i) $m^2 - 2ln$, (ii) $lm - n$
 18. 36 19. (i) $4/3$, (ii) $16/9$.

Problems 1.2, page 8

1. $x^3 + 6x^2 - 36x + 27 = 0$ 2. $6x^5 - 7x^4 - 13x^3 + 4x^2 - 2 = 0$ 3. $10x^4 + 9x^3 + 8x^2 - 7x + 1 = 0$
 4. $-\frac{1}{2}, \frac{1}{3}, 2$ 5. (i) $x^3 - 9x^2 + 26x - 24 = 0$; (ii) $x^4 + 13x^3 + 60x^2 + 116x + 80 = 0$;
 (iii) $x^5 + 7 = 0$
 6. $x^3 + 15x^2 + 52x - 36 = 0$ 7. $y^3 + (p^3 + 3q)y^2 + 3q^2y + q^3 = 0$ 8. $3x^3 - 11x^2 + 9x - 2 = 0$
 9. $y^3 - qy^2 + py - r^2 = 0$
 10. (a) $y^3 + 4my - 8n = 0$; (b) $nx^3 + m^2x^2 - 2mnx + n^2 = 0$; (c) $x(nx + m)^2 = n$
 11. $y^3 - 30y^2 + 225y - 68 = 0$
 12. (i) $\frac{-5 \pm \sqrt{21}}{2}, \frac{5 \pm \sqrt{91i}}{12}$ (ii) $2, 2, 1/2, 1/2$ (iii) $1, -2, 4, -1/2, 1/4$;
 (iv) $-1, -2, 3, -1/2, 1/3$; (v) $\pm 1, -3, -1/3, \frac{3 \pm \sqrt{5}}{2}$
 13. $\frac{1}{2}(5 \pm \sqrt{21}) ; \frac{1}{2}(-3 \pm \sqrt{5})$ 14. $-1, -2, -6, -7$.

Problems 1.3, page 11

1. $-6, 3, 3$ 2. $5, \frac{1}{2}(-5 \pm i\sqrt{3})$ 3. $6, -3 \pm 2\sqrt{(-3)}$
 4. $-1, -2, \frac{1}{2}$ 5. $\frac{1}{2}, -\frac{1}{6}(3 \pm i\sqrt{3})$ 6. $5, \frac{1}{2}(1 + i\sqrt{3})$
 7. $2 \cos \frac{2\pi}{9}, 2 \cos \frac{8\pi}{9}, 2 \cos \frac{14\pi}{9}$ 8. $\frac{1}{2}, \frac{-7 \pm 9i\sqrt{3}}{6}$.

Problems 1.4, page 12

- 1.** 1, 2, 3, 4 **2.** $-3, 1, \pm 2$ **3.** $4, -2, -1 \pm i$
4. $-1, 3, 3 \pm \sqrt{30}$ **5.** $1 \pm \sqrt{7}, 2 \pm \sqrt{3}$ **6.** $1 \pm 2i, -1 \pm \sqrt{2}$
7. $2 \pm \sqrt{3}, -2 \pm i\sqrt{3}$ **8.** $2, 4, 2 \pm 2i\sqrt{2}$

Problems 1.5, page 15

- 1.** 1.32 **2.** 2.29 **3.** 0.45
4. (i) 0.71 rad **5.** 1.81 rad **6.** 0.26

Problems 1.6, page 15

- 1.** (d) **2.** (c) **3.** (c)
4. (c) **5.** (c) **6.** (a)
7. (d) **8.** (b) **9.** (c)
10. (a) **11.** (c) **12.** minus
13. § 15.1 (v) **14.** p/q **15.** 21
16. -3 and -2 **17.** Conjugate pairs **18.** $f(x)$ is continuous in (a, b)
19. $x^3 - 9x^2 + 29x - 24 = 0$ **20.** $3, 6, -2$ **21.** $x^3 - 200x - 7000 = 0$
22. p/r **23.** $x^4 + 2x^3 - x^2 - 6x - 6 = 0$ **24.** 6
25. minus **26.** $pq = r$ **27.** $1, \frac{1}{2}(-1 \pm \sqrt{3}i)$
28. (iii) **29.** $1, 1, -2$ **30.** $x^3 - 7x^2 + 12x - 10 = 0$
31. Zero and 2 **32.** 21 **33.** True
34. True.

Problems 2.1 page 25

- 5.** (i) 1 (ii) 0 **13.** $(a-b)(b-c)(c-a)$
14. $(a-b)(b-c)(c-a)(ab+bc+ca)$ **15.** $(b-c)(c-a)(a-b)(a-1)(b-1)(c-1)$
16. $(a-b)(a-c)(a-d)(b-c)(b-d)(c-d)$ **17.** $x = 0, \pm \sqrt{(a^2 + b^2 + c^2 - ab - bc - ca)}$
18. $0, -\frac{1}{2}$.

Problems 2.2 page 31

- 1.** $x = 0, 3$ **2.** $x = -3, y = -2, z = -4, a = 3$
3. $x = 3, y = 8$ **4.** $-2 \begin{bmatrix} 1 & 1 \\ 0 & 3 \end{bmatrix}$
5. $AB = \begin{bmatrix} 4 & 4 & 7 & 10 \\ 10 & 7 & 11 & 21 \\ 4 & 3 & 3 & 9 \end{bmatrix}$ **7.** (i) $[ax^2 + by^2 + cz^2 + 2fyz + 2gzx + 2hxy]$
(b) $\begin{bmatrix} 8 & 7 \\ 122 & 104 \\ -365 & -131 \end{bmatrix}$ (iii) $\begin{bmatrix} 9 & 6 \\ -18 & -12 \\ 27 & 18 \end{bmatrix}$ **10.** $3I$
11. $\begin{bmatrix} -6 & 1 & 2 \\ 5 & 4 & 4 \\ 2 & 8 & -3 \end{bmatrix}$ **15.** $\begin{bmatrix} 1 & 0 & 0 \\ 7/5 & 1 & 0 \\ 3/5 & 41/19 & 1 \end{bmatrix} \begin{bmatrix} 5 & -2 & 1 \\ 0 & 19/5 & -32/5 \\ 0 & 0 & 327/19 \end{bmatrix}$

Problems 2.3, page 35

$$2. (i) \begin{bmatrix} 3 & 0 & 5.5 \\ 0 & 7 & 1.5 \\ 5.5 & 1.5 & 0 \end{bmatrix} + \begin{bmatrix} 0 & -2 & 5 \\ 2 & 0 & -2.5 \\ -0.5 & 2.5 & 0 \end{bmatrix} (ii) \begin{bmatrix} a & \frac{1}{2}(a+c) & \frac{1}{2}(b+c) \\ \frac{1}{2}(a+c) & b & \frac{1}{2}(a+b) \\ \frac{1}{2}(b+c) & \frac{1}{2}(a+b) & c \end{bmatrix} + \begin{bmatrix} 0 & \frac{1}{2}(a-c) & \frac{1}{2}(b-c) \\ \frac{1}{2}(c-a) & 0 & \frac{1}{2}(b-a) \\ \frac{1}{2}(c-b) & \frac{1}{2}(a-b) & 0 \end{bmatrix}$$

$$4. (i) \begin{bmatrix} 2 & 4/5 & 9/5 \\ 3 & -4/5 & -14/5 \\ -1 & 1/5 & 6/5 \end{bmatrix} (ii) \begin{bmatrix} 1/33 & -4/33 & 2/11 \\ -4/33 & 14/33 & 13/33 \\ 2/11 & 13/33 & -1/33 \end{bmatrix}$$

$$5. B = \begin{bmatrix} 1 & 0 & 0 \\ 0 & 2 & 0 \\ 0 & 0 & 1 \end{bmatrix} 6. (i) \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix}.$$

Problems 2.4, page 40

$$1. 3 \quad 2. 2 \quad 3. 3 \quad 4. 2 \quad 5. 3$$

6. No value of p is possible.

$$7. (i) \begin{bmatrix} 8 & -1 & -3 \\ -5 & 1 & 2 \\ 10 & -1 & -4 \end{bmatrix} (ii) \frac{1}{21} \begin{bmatrix} 1 & 10 & -7 \\ 1 & -11 & 14 \\ -3 & 12 & 0 \end{bmatrix}$$

$$(iii) \begin{bmatrix} -1/9 & 2/9 & 2/9 \\ 2/9 & -1/9 & 2/9 \\ 2/9 & 2/9 & -1/9 \end{bmatrix} (iv) \begin{bmatrix} 1/2 & -1/2 & 1/2 \\ -1/2 & 3 & -1 \\ 5/2 & -3/2 & 1/2 \end{bmatrix}$$

$$8. P = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ 1 & -2 & 1 \end{bmatrix}, Q = \begin{bmatrix} 1 & 2/3 & -7/24 & 5/6 \\ 0 & -1/3 & 0 & 1/3 \\ 0 & 0 & -5/24 & 1/2 \\ 0 & 0 & -1/12 & 0 \end{bmatrix}, \text{Rank}(A) = 3$$

$$9. \begin{bmatrix} 1 & -1 & 0 \\ -2 & 3 & -4 \\ -2 & 3 & -3 \end{bmatrix} 10. (i) P = \begin{bmatrix} 1 & 0 & 0 \\ -\frac{1}{2} & \frac{1}{2} & 0 \\ \frac{1}{2} & 1 & -\frac{1}{2} \end{bmatrix}, Q = \begin{bmatrix} 1 & 1 & -1 \\ 0 & 1 & 0 \\ 0 & 0 & 1 \end{bmatrix};$$

$$(ii) P = \begin{bmatrix} 1 & 0 & 0 \\ -2 & 1 & 0 \\ -1 & -1 & 1 \end{bmatrix}, Q = \begin{bmatrix} 1 & \frac{1}{3} & -\frac{4}{3} & -\frac{1}{3} \\ 0 & -\frac{1}{6} & -\frac{5}{6} & \frac{7}{6} \\ 0 & 0 & 1 & 0 \\ 0 & 0 & 0 & 1 \end{bmatrix}$$

$$11. (i) 3 \quad (ii) 3 \quad (iii) 2 \quad (iv) 3.$$

Problems 2.5, Page 43

$$1. \begin{bmatrix} 7 & -3 & -3 \\ -1 & 1 & 0 \\ -1 & 0 & 1 \end{bmatrix} 2. \frac{1}{8} \begin{bmatrix} 2 & 2 & -2 \\ -9 & 11 & 5 \\ 5 & -7 & -1 \end{bmatrix}$$

$$3. \begin{bmatrix} 1 & -2 & 1 & 0 \\ 1 & -2 & 2 & -3 \\ 0 & 1 & -1 & 1 \\ -2 & 3 & -2 & 3 \end{bmatrix} 4. \begin{bmatrix} 7 & -3 & 0 & -5 \\ 8 & 1 & -2 & -11 \\ -5 & 0 & 1 & 6 \\ 19 & 5 & -6 & -28 \end{bmatrix}$$

Problems 2.6, page 45

$$1. x = 1, y = 2, z = 1 \\ 3. x = 1.2, y = 2.2, z = 3.2$$

$$2. x = 2, y = -1, z = 1/2 \\ 4. x = y = z = e^2$$

5. $u = 1, v = 1/2, w = 1/3$
 6. $x_1 = 1, x_2 = -5, x_3 = 5$
 7. $x = 2, y = 1, z = 0$
 8. $x = 1/7, y = 10/7, z = 1/7$
 9. $x = y = z = 2$
 10. $x_1 = 2, x_2 = 1, x_3 = -1, x_4 = 3$
 11. $x = 1, y = -1, z = 1$
 12. $i_1 = 1.5, i_3 = 2.5$
 13. $i_1 = 369/175, i_2 = 24/25, i_3 = 72/175$
 14. $x_1 = 2, x_2 = 1/5, x_3 = 0, x_4 = 4/5.$

Problems 2.7, page 50

1. Consistent; $x = 1, y = 3k - 2, z = k$ for all k
2. $k = 1, x = -3z, y = 2z + 1$; $k = 2, x = 1 - 3z, y = 2z$
3. (i) $\lambda = 3, \mu \neq 10$; (ii) $\lambda \neq 3$; (iii) $\lambda = 3, \mu = 10$
4. (i) Equations are inconsistent; (ii) consistent; $x = -1, y = 1, z = 2$;
 (iii) Equations are inconsistent; (iv) Consistent; $x = 2, y = 1, z = -4$
5. If $a = -1, b = 6$, equations will be consistent and have infinite number of solutions
 If $a = -1, b \neq 6$, equations will be inconsistent;
 If $a \neq -1, b$ has any value, equations will be consistent and have a unique solution
6. $\lambda \neq -5, x = 4/7, y = -9/7, z = 0$; $\lambda = -5, x = \frac{1}{7}(4 - 5k), y = \frac{1}{7}(13k - 9), z = k$ for all k
9. $\lambda = -1, 1, 12$; $x = -1/11, y = -15/11$; $x = -5, y = 1$; $x = \frac{1}{2}, y = 1$
11. $k = 3$ is the only real value for which $x = y = z$
12. $\lambda = 1, x_1 = 2t - s, x_2 = t, x_3 = s$; $\lambda = -3, x_1 = -t, x_2 = -2t, x_3 = t$
13. $\lambda = 1, -9$. For $\lambda = 1$, sol. is $x = k, y = -k, z = 2k$
 For $\lambda = -9$, sol. is $x = 3k, y = 9k, z = -2k$
14. (i) Have infinite number of non-trivial solutions; $x = \lambda - 5\mu/3, y = \lambda - 4\mu/3, z = \lambda, w = \mu$ for all values of λ and μ . (ii) $x = 11k_2 + 6k_1, y = -8k_2 - 3k_1, z = k_2, w = k_1$ where k_1, k_2 are arbitrary constants.

Problems 2.8, page 54

1. $\begin{bmatrix} x_1 \\ x_2 \end{bmatrix} = \begin{bmatrix} 9 & 6 \\ 11 & -2 \end{bmatrix} \begin{bmatrix} z_1 \\ z_2 \end{bmatrix}$
2. $A = \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix}, A^{-1} = A' = \begin{bmatrix} \cos \alpha & \sin \alpha \\ -\sin \alpha & \cos \alpha \end{bmatrix}$
3. $Z = (BA)X$, where $BA = \begin{bmatrix} 1 & 4 & -1 \\ -1 & 9 & -1 \\ -3 & 14 & -1 \end{bmatrix}$
4. $x_1 = 19y_1 - 9y_2 + 2y_3$; $x_2 = -4y_1 + 2y_2 - y_3$; $x_3 = -2y_1 + y_2$
6. $a = \pm \frac{1}{\sqrt{2}}, b = \pm \frac{1}{\sqrt{6}}, c = \pm \frac{1}{\sqrt{3}}$
9. (i) No. (ii) No. (iii) Yes, $9x_1 - 12x_2 + 5x_3 - 5x_4 = 0$.

Problems 2.9, page 60

1. 10; 30
2. (a) 10, 3; (1, 2), (3, -1); (b) -1, 6; (1, 1), (2, -5)
3. (a) 0, 3, 5; (1, 2, 2), (2, 1, -2), (2, -2, 1)
 (b) 1, 2, 3; (1, 0, -1), (0, 1, 0), (1, 0, 1)
 (c) 5, -3, -3; (1, 2, -1), (2, -1, 0), (3, 0, 1)
 (d) 8, 2, 2; (2, -1, 1), (1, 0, -2), (1, 2, 0)
 (e) 2, 3, -1; (3, 1, 1), (-4, 1, -3), (0, 5, 5)
5. (i) 8, 12, 6 (ii) 49, 121, 25 6. 1, 1, 1/5
9. (i) $\begin{bmatrix} 2 & 3 \\ 3 & 5 \end{bmatrix}$; (ii) $\frac{1}{9} \begin{bmatrix} 0 & 3 & 3 \\ 3 & 2 & -7 \\ 3 & -1 & -1 \end{bmatrix}$; (iii) $\frac{1}{4} \begin{bmatrix} 12 & 4 & 6 \\ -5 & -1 & -3 \\ -1 & -1 & -1 \end{bmatrix}$; (iv) $\begin{bmatrix} 1 & 1/2 & -2/3 \\ 0 & -1/2 & 0 \\ 0 & 0 & 1/3 \end{bmatrix}$
10. $\lambda^3 - 4\lambda^2 - 20\lambda - 35 = 0$, $\frac{1}{35} \begin{bmatrix} -4 & 11 & -5 \\ -1 & -6 & 25 \\ 6 & 1 & -10 \end{bmatrix}$

11. (i) $\frac{1}{4} \begin{bmatrix} 3 & 1 & -1 \\ 1 & 3 & 1 \\ -1 & 1 & 3 \end{bmatrix}$ (ii) $\frac{1}{3} \begin{bmatrix} -3 & -2 & 2 \\ 6 & 5 & -2 \\ -6 & -2 & 5 \end{bmatrix}$ (iii) $\frac{1}{27} \begin{bmatrix} 1 & 10 & -8 \\ -8 & 1 & 10 \\ 10 & -8 & 1 \end{bmatrix}$

12. $625I$

13. $\lambda^3 - 6\lambda^2 + 8\lambda - 3 = 0, \begin{bmatrix} 124 & -123 & 162 \\ -95 & 96 & -123 \\ 95 & -95 & 124 \end{bmatrix}$

14. $\begin{bmatrix} 1/5 & 0 & 0 \\ 0 & 1/5 & 0 \\ 0 & 0 & 1/5 \end{bmatrix}$

 24. (b) or (c) 25. (a).

Problems 7.1, page 280

1. 13 2. $3/35$ 3. $\frac{1}{2}(e - 1)$ 4. $\frac{1}{4}\pi \log(1 + \sqrt{2})$

5. $a^4/8$ 6. $\frac{\pi}{4}ab(a^2 + b^2)$ 7. $3/56$ 8. $\pi a/4$

9. $241/60$ 10. $1 - 1/\sqrt{2}$ 11. $\frac{\pi a^2}{4}(\log e - \frac{1}{2})$ 12. $1/24$

13. $\frac{2}{3}a^4$ 14. $\pi a^2/b$ 15. 1

16. (i) $\int_0^{2a} \int_{y\sqrt{2a}}^{2a} f(x, y) dx dy - \int_0^a \int_{a-\sqrt{(a^2-y^2)}}^{a+\sqrt{(a^2-y^2)}} f(x, y) dx dy,$ (ii) $\int_0^{\pi/2} \int_a^{ae^{\theta/2}} f(r, \theta) r dr d\theta$

18. $4a^2/3$ 19. $45\pi/2.$

Problems 7.2, page 283

1. 4.5 2. $7/6$ 3. πa^2 4. $\frac{3}{2} \log_e 3 - \frac{2}{3}$
 5. a^2 6. $a^2(1 - \pi/4)$ 7. $4/3$ 8. $a^2/4.$

Problems 7.3, page 284

1. $\frac{abc}{3}(a^2 + b^2 + c^2)$ 2. $\frac{8}{3}abc(a^2 + b^2 + c^2)$ 3. $4/35$
 4. $\frac{1}{8}e^{4a} - \frac{3}{4}e^{2a} + e^a - \frac{3}{8}$ 5. $\frac{8}{3} \log 2 - \frac{19}{9}$ 6. $\frac{1}{4}(13 - 8e + e^2)$
 7. $5\pi a^3/64.$

Problems 7.4, page 291

1. $\pi/8$ 2. $\pi/2$ 3. $8\left(\frac{\pi}{2} - \frac{5}{3}\right)a^2$ 4. $\frac{2^{n+3}}{n+4}$
 5. $\frac{\pi}{4} - \frac{1}{2}$ 6. 0 7. $\frac{15\pi a^4}{64}$ 9. π
 10. $\pi^2/8$ 11. $4\pi a$ 12. $\frac{1}{2}\left(\log 2 - \frac{5}{8}\right)$ 14. $\pi a^6/12$
 15. 3π 16. 4π 17. $\pi a^3(2 - \sqrt{2})/3$ 18. $16a^3/3$
 19. $\pi a^3/8$ 20. $128a^3/15$ 21. $3\pi a^3$ 22. $4\sqrt{3}\pi$
 23. $8a^4/3$ 25. $\frac{1}{4}$ 26. $\frac{1}{6}abc.$

Problems 7.5, page 293

2. 64 3. $2(\pi - 2)a^2$ 4. $2\pi a^2$ 5. $\frac{3\pi a^2}{4}.$

Problems 7.6, page 297

1. $182 \frac{7}{24} \lambda$

2. $21 \pi \mu a^4 / 32$

3. 30.375

4. $\left(\frac{3a}{20}, \frac{3a}{16} \right)$

5. $\left[\frac{a(4a+3b)}{6(a+b)}, \frac{b(3a+b)}{6(a+b)} \right]$

6. $\left(\frac{\pi a \sqrt{2}}{8}, 0 \right)$

8. $\bar{x} = 3a/5$, $\bar{y} = 9a/40$ where $a = OA$ 9. $(1/5, 1/5, 2/5)$.

10. $\bar{x} = 3/4$

11. $\left(\frac{16a}{35}, \frac{16b}{35}, \frac{16c}{35} \right)$

12. $\frac{27}{26}$ metres

13. $\left(\frac{3a}{8}, \frac{3\pi a}{16} \right)$

14. Divides the diagonal in the ratio 7 : 5

15. $\left(\frac{a}{2}, \frac{2}{3} h \right)$ where a is the base, h the depth

16. C.P. lies on the radius \perp to the bounding diameter at a depth $32a/(15\pi)$ from the centre.

Problems 7.7, page 301

1. $ab^3/12$

2. $5Ma^2/4$

3. $2M/9$

4. $\frac{1}{3}M(a^2 + b^2)$

5. $(21/32)\pi pa^4$

6. $\frac{2}{5}MR^2$

7. $\frac{1}{2}Mr^2$; $\frac{1}{12}M(3r^2 + 4h^2)$

8. (i) $\frac{3Mr^2}{10}$; (ii) $\frac{3M}{20}(r^2 + 4h^2)$; (iii) $\frac{M}{20}(3r^2 + 2h^2)$

9. 104803770p

10. $\frac{1}{30}$

11. $\frac{\pi abc(a^2 + b^2)}{30}$

12. $\frac{\pi a^2 b^2}{8}$.

Problems 7.8, page 309

1. (i) 3.323, (ii) 11.629; (iii) $\pi\sqrt{2}$; (iv) 0.1964; (v) 0.1227

2. (i) $\sqrt{\pi}/2$; (ii) $\Gamma(5/4)$; (iii) $\sqrt{\pi}/3$; (iv) $2^{p+q-1}\beta(p, q)$

4. $\pi/4\sqrt{2}$

7. -3/8

9. $\frac{\Gamma\left(\frac{m+1}{n}\right)\Gamma(p+1)}{n\Gamma\left(\frac{m}{n}+p+1+\frac{1}{n}\right)}$, (i) $\frac{1}{396}$ (ii) $\frac{\sqrt{\pi}}{n} \cdot \frac{\Gamma\left(\frac{1}{n}\right)}{\Gamma\left(\frac{1}{n}+\frac{1}{2}\right)}$

10. 16/35

15. $\frac{ka^2b^2c^2}{48}$.

Problems 7.9, page 312

2. $\frac{1}{2}K(\sqrt{3}/2)$

3. $\frac{2}{\sqrt{3}} \left\{ F\left(\frac{\sqrt{2}}{\sqrt{3}}, \frac{1}{2}\pi\right) - F\left(\frac{\sqrt{2}}{\sqrt{3}}, \frac{1}{4}\pi\right) \right\}$

4. $2\sqrt{2}E(1/\sqrt{2}) - \sqrt{2}K(1/\sqrt{2})$

5. $erf(x) = \frac{2}{\pi} \left(x - \frac{x^3}{3} + \frac{x^5}{10} - \frac{x^7}{42} + \dots \right)$; $erf(0) = 0$ 6. (i) 0.3248; (ii) 0.5204.

Problems 7.10, page 313

1. 4

2. Area of the triangle having vertices (0, 0), (0, 1), (1, 0)

3. $\sqrt{\pi}/2$

4. 3.1416

5. $15\sqrt{\pi}/8$

6. 92π

6. 26

8. -1/3

9. $1/2\beta(4, 3/4)$

10. 1

11. $3/4$ 12. $\frac{\pi a^3}{6}$ 13. (d) 14. $27/4$
 15. $\pi a^2/12$ 16. $-1/3$ 17. ∞ 18. $44/105$
 19. $r^2 \sin \theta dr d\theta d\phi$ 20. $e^2 - 1$ 21. $\frac{1}{4} \pi ab(a^2 + b^2)$, 22. $\frac{1}{4} \pi \log(1 + \sqrt{2})$
 23. $3/256$ 24. (c) 25. $\frac{6}{25} + \frac{1}{2} \sin \frac{3}{5}$ 26. $48/5$
 27. $1/6$ 28. $16/3$ 29. $\int_0^a \int_{-\sqrt{a^2-x^2}}^{\sqrt{a^2-x^2}} f(x, y) dy dx$
 30. $\sqrt{2}\pi$ 31. $3\pi/256$ 32. $1/2$ 33. $\int_0^{\pi/2} \int_0^{2a \cos \theta} r dr d\theta$
 34. $\frac{7h}{12}$ 35. $\left(\frac{3}{20}, \frac{3}{16}\right)$ 36. 16 37. $3Mr^2/10$
 38. 1 39. $\log 2$ 40. $\frac{1}{2}\sqrt{\pi}$ 41. (c) 42. (b).

Problems 8.1, page 318

3. (i) $t^3 \sin t + 7t^2 \cos t + 20t \sin t - 10t$; (ii) $(20t^3 + t \sin t - \cos t)\mathbf{I} - (2t \cos t + 2 \sin t + 75t^2)\mathbf{J} - t(t \sin t + 2t^2 \cos t + 10 \cos t)\mathbf{K}$
 5. $-4(\mathbf{I} + 2\mathbf{J})$ 6. (i) $(ua^2 \sec \alpha)$. (ii) $a^3 \tan \alpha$; $(\cos t \mathbf{J} - \sin t \mathbf{I}) \cos \alpha + \sin \alpha \mathbf{K}$
 7. $[t\mathbf{I} + 2\mathbf{J} + (2t - 3)\mathbf{K}] / \sqrt{(5t^2 - 12t + 13)}$; $\frac{1}{3}(2\mathbf{I} + 3\mathbf{J} + \mathbf{K})$
 8. $(x - a/\sqrt{2}) = y - a/\sqrt{2} = \left(z - \frac{a\pi}{4} \tan \alpha\right) / \sqrt{2} \tan \alpha$
 9. (i) $ab/(a^2 \sin^2 t + b^2 \cos^2 t)^{3/2}$; (ii) $1/4\sqrt{2}$
 10. (i) $\mathbf{R} = (p+q)\mathbf{I} + q\mathbf{J} + 2q\mathbf{K}$; $\frac{2\mathbf{J} - \mathbf{K}}{\sqrt{5}}$
 (ii) $\mathbf{R} = p\mathbf{I} + (p+2q)\mathbf{J} + (p+q)\mathbf{J} + (p+q)\mathbf{K}$; $(2\mathbf{K} - \mathbf{I} - \mathbf{J})/\sqrt{6}$.

Problems 8.2 page 321

1. $v(\text{at } t=0) = \sqrt{37}$, $a(\text{at } t=0) = \sqrt{325}$ 2. $\alpha = \pm 1/\sqrt{6}$
 3. $8\sqrt{14/7}; -\sqrt{14/7}$ 6. (a) d^2s/dt^2 ; v^2/p ; (b) 0; 3
 7. $\sqrt{17}$ m.p.h. in the direction $\tan^{-1}(0.25)$ North of East
 8. 21.29 knots/hr. in the direction $74^\circ 47'$ South of East.

Problems 8.3, page 325

1. (a) $2(x\mathbf{I} + y\mathbf{J} + z\mathbf{K})/(x^2 + y^2 + z^2)$, (b) $\frac{6}{3} + c$ 2. $(-\mathbf{I} + 3\mathbf{J} + 2\mathbf{K})/\sqrt{14}$
 3. $12\frac{1}{3}$ 4. $15/\sqrt{17}$ 5. $a = 6, b = 24, c = -8$
 6. $-260/(69); \sqrt{1056}$ 7. $a = \pm \frac{20}{9}, b = \pm \frac{55}{9}, c = \pm \frac{55}{9}$ 8. $96(\mathbf{I} + 3\mathbf{J} - 3\mathbf{K}); 96\sqrt{19}$
 9. 9 10. $\frac{1}{3}(2\mathbf{I} + 2\mathbf{J} - \mathbf{K})$ 11. $\cos^{-1}(1/\sqrt{22})$
 12. $\cos^{-1}(-1/\sqrt{30})$ 13. $a = -6, b = -10$.

Problems 8.4, page 333

1. (i) $12 \mathbf{I} - 16\mathbf{J} + 9\mathbf{K}$; (ii) $278 \mathbf{I} + 5(27\mathbf{I} - 54\mathbf{J} + 8\mathbf{K})$; (iii) $-32 \mathbf{I}$
 4. $a = -2$; $4x(z - xy)\mathbf{I} + (y - 2yz + 4xy^2)\mathbf{J} + (2x^2 + y^2 - z^2 - z)\mathbf{K}$
 13. (i) 0; (ii) $2(x+z)\mathbf{J} + 2y\mathbf{K}$ 14. (a) $2n(2n-1)x^2 + y^2 + z^2)^{n+1}$; $n = 1/2$
 16. (i) $2(y^3 + 3x^2y - 6xy^2)\mathbf{z}\mathbf{I} + 2(3xy^2 + x^3 - 6x^2y)\mathbf{z}\mathbf{J} + 2(xy^2 + x^3 - 3x^2y)\mathbf{y}\mathbf{K}$; (ii) Zero
 17. $1724/\sqrt{21}$.

Problems 8.5, page 335

1. $75\frac{1}{3}\mathbf{I} + 360\mathbf{J} - 42\mathbf{K}$ 2. $(t^3 - t + 2)\mathbf{I} + (1 - t^4)\mathbf{J} + (4 - 4 \cos t - 3t)\mathbf{K}$
 3. $\mathbf{V} = 6 \sin 2t\mathbf{I} + 4(\cos 2t - 1)\mathbf{J} + 8t^2\mathbf{K}$; $\mathbf{R} = 3(1 - \cos 2t)\mathbf{I} + 2 \sin 2t\mathbf{J} + \frac{8t^3}{3}\mathbf{K}$.

Problems 8.6, page 336

Problems 15.4, page 536

1. $y = 2x - 2 \log(1 - c_1 e^{2x}) + c_2$ 2. $y^2 = x^2 + c_1 x + c_2$
 3. $\log y = c_1 e^x + c_2 e^{-x}$ 4. $(\log y - 1)(c_1 x + c_2) = 1$
 5. $(x - a)^2 + y^2 = c^2$, circles whose centres are on the x -axis.

Problems 15.5, page 537

1. $y = e^{x^2}(c_1 x + c_2)$ 2. $y = (x^2 - x + c_1 x)e^x + c_2 x$
 3. $y = e^x(c_1 \log x + x + c_2)$ 4. $cy = 1 + (k - x) \cot x$
 5. $y = \left[c_1 - \frac{1}{2} \cos x - \frac{1}{5} c_2 e^{-2x} (\cos x + 2 \sin x) \right] e^x$.

Problems 15.6, Page 539

1. $y = c_1 \cos(\sin x) + c_2 \sin(\sin x)$ 2. $y = c_1 \cos(1/x) + c_2 \sin(1/x)$
 3. $y = c_1 e^t + c_2 e^{-t}$ where $t = \cos x$ 4. $y = c_1 \cos(2 \tan^{-1} x) + c_2 \sin(2 \tan^{-1} x)$
 5. $y = c_1 e^{\sqrt{2} \sin x} + c_2 e^{-\sqrt{2} \sin x} + \sin^2 x$.

Problems 15.7, page 540

1. $nx - lz = c(mz - ny)$
4. $x^2 + y^2 - xz = cz$

2. $x^2 + y^2 + z^2 = cx$
5. $y(x+z) = c(x+y+z)$

3. $xy^2 = cz^3$
6. $x + y + z + \log(xyz) = c$.

Problems 15.8, page 541

1. $x^3 - y^3 = c_1, x^2 - z^2 = c_2$
4. $x^2 - y - 2xy = c_1, x^2 - y^2 - z^2 = c_2$
5. $xyz = c_1, x^2 + y^2 + z^2 = c_2$

Problems 16.1, page 544

1. $y = a_1 \left(x - \frac{x^3}{3!} + \frac{x^5}{5!} - \dots \right)$

2. $y = a_0 \left(1 - \frac{x^4}{4 \cdot 3} + \frac{x^6}{8 \cdot 7 \cdot 4 \cdot 3} - \frac{x^{12}}{12 \cdot 11 \cdot 8 \cdot 7 \cdot 4 \cdot 3} + \dots \right)$
 $+ a_1 \left(x - \frac{x^5}{5 \cdot 4} + \frac{x^9}{9 \cdot 8 \cdot 5 \cdot 4} - \frac{x^{13}}{13 \cdot 12 \cdot 9 \cdot 8 \cdot 5 \cdot 4} + \dots \right)$

3. $y = a_0 \left(1 - \frac{x^2}{2} + \frac{x^4}{2 \cdot 4} - \frac{x^6}{2 \cdot 4 \cdot 6} + \dots \right) + a_1 \left(x - \frac{x^3}{3} + \frac{x^5}{3 \cdot 5} - \frac{x^7}{3 \cdot 5 \cdot 7} + \dots \right)$

4. $y = 4 + 5x - 4x^2 - \frac{5}{3}x^3 - \frac{x^5}{3} - \frac{x^7}{7} - \dots$
5. $y = a_0 \left(1 + \frac{x^2}{2} - \frac{x^4}{8} + \frac{x^6}{16} - \frac{5x^8}{128} + \dots \right) + a_1 x$

6. $y = a_0(1 - x^2 + \frac{1}{3}x^4 - \frac{1}{5}x^6 + \dots) + a_1 x.$

Problems 16.2, page 550

1. $y = c_1 \cos \sqrt{x} + c_2 \sin \sqrt{x}$

2. $y = a_0 \left(1 - x^2 + \frac{x^4}{4} \dots \right) + a_1 \left(x - \frac{x^3}{2} + \frac{3x^5}{10} \dots \right)$

3. $y = (c_1 + c_2 \log x) \left[1 + x + \frac{1}{(2!)^2} x^2 + \frac{1}{(3!)^3} x^3 + \dots \right] - 2c_2 \left[x + \frac{1}{(2!)^2} (1 + \frac{1}{2}) x^2 + \frac{1}{(3!)^2} (1 + \frac{1}{2} + \frac{1}{3}) x^3 + \dots \right]$

4. $y = c_1(1 + x + x^2/4 + x^3/4 \cdot 7 + \dots) + c_2 x^{2/3} (1 + \frac{1}{3}x + x^2/3 \cdot 6 + x^3/3 \cdot 6 \cdot 9 + \dots)$

5. $y = a_0 \left(1 - 2x + \frac{3}{2!} x^2 - \frac{4}{3!} x^3 + \dots \right) + a_1 \left[y_1 \log x + a_0 \left(3x - \frac{13}{4} x^2 + \dots \right) \right]$

6. $y = a_0 x \left(1 + \frac{x}{5} + \frac{x^2}{70} + \dots \right) + a_1 x^{-1/2} \left(1 - x - \frac{x^2}{2} + \dots \right)$

7. $y = c_1 x^{-\frac{1}{2}} \left(1 + \frac{x}{2} + \frac{x^2}{40} + \dots \right) + c_2 x^{1/4} \left(1 + \frac{x}{14} + \frac{x^2}{616} + \dots \right)$
 $+ c_2 \sqrt{x} (x + x^2/2 \cdot 3 + x^4/2 \cdot 4 \cdot 3 \cdot 7 + x^6/2 \cdot 4 \cdot 6 \cdot 3 \cdot 7 \cdot 11 + \dots)$

8. $y = a_0 \sqrt{x}(1-x) + a_1 \left(1 - 3x + \frac{3x^2}{1 \cdot 3} + \frac{3x^3}{3 \cdot 5} + \frac{3x^4}{5 \cdot 7} + \dots \right)$

9. $y = a_0(1 - \frac{2}{3}x + \frac{1}{3}x^2 + \dots) + a_1x^4(1 - 2x + 3x^2 - 4x^3 + \dots)$

10. $y = c_1\left(1 + 3x^2 + \frac{3}{5}x^4 + \dots\right) + c_2x^{3/2}\left(1 + \frac{3}{8}x^2 - \frac{1.3}{8.16}x^4 + \frac{1.3.5}{8.16.24}x^6 + \dots\right).$

Problems 16.3, page 557

1. 0.224, 0.44.

Problems 16.4, page 562

1. $y = c_1 J_{1/2}(x) + c_2 J_{-1/2}(x)$

2. $y = c_1 J_{2/5}(x) + c_2 J_{-2/5}(x)$

3. $y = x^n [c_1 J_n(kx) + c_2 Y_n(kx)]$ where $n = \frac{1}{2}(1 - \alpha)$

4. $y = x[c_1 J_1(2x) + c_2 Y_1(2x)]$

5. $y = c_1 \sqrt{x} J_1(2\sqrt{x}) + c_2 \sqrt{x} Y_1(2\sqrt{x})$

7. $y = c_1 \sqrt{x} J_n(x) + c_2 \sqrt{x} J_{-n}(x)$

11. $x^2 = \sum_{n=1}^{\infty} \frac{2}{\alpha_n^2} \cdot \frac{1}{J_2^2(3\alpha_n)} (3\alpha_n J_1(3\alpha_n) - 2J_2(2\alpha_n))$

Problems 16.5, page 570

3. (i) $2P_3 + 4P_1$;

(ii) $\frac{2}{5}P_3 + \frac{4}{3}P_2 - \frac{2}{5}P_1 - \frac{7}{3}P_0$;

(iii) $\frac{8}{5}P_3 - 4P_2 + \frac{47}{5}P_1 + 4$

(iv) $\frac{8}{35}P_4 + \frac{6}{5}P_3 - \frac{2}{21}P_2 + \frac{34}{5}P_1 - \frac{224}{105}P_0$

9. (i) $f(x) = -\frac{7}{3}P_0(x) - \frac{2}{5}P_1(x) + \frac{4}{3}P_2(x) + \frac{2}{5}P_3(x)$;

(ii) $f(x) = -\frac{32}{15}P_0(x) - \frac{4}{5}P_1(x) - \frac{40}{21}P_2(x) + \frac{2}{5}P_3(x) + \frac{8}{35}P_4(x)$.

Problems 16.6, page 572

1. $x^3 = \frac{1}{4}(3T_1 + T_3)$.

Problems 16.7, page 575

1. $y_n(x) = \sin nx$, $n = 1, 2, \dots$

2. $y_n(x) = \sin [(2n+1)\pi x/2]$, $n = 0, 1, 2, \dots$

Problems 18.3, page 617

1. $u(x, t) = \frac{400}{\pi^2} \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)^2} e^{-(2n+1)\pi t/100} \sin \frac{(2n+1)\pi x}{100}$

2. $\sum_{n=odd} \frac{8a}{n^3 \pi^3} \sin \frac{n\pi x}{l} e^{(nn\pi/l)^2 t}$ 3. $u(x, t) = \frac{40}{\pi} \sum_{n=1}^{\infty} \frac{[1-4(-1)^n]}{n} \sin \left(\frac{n\pi x}{30} \right) e^{-\frac{(ann)^2 t}{900}}$

4. $u(x, t) = -3x + 90 - \frac{80}{\pi} \sum_1^{\infty} \frac{1}{n} \sin \frac{n\pi x}{5} e^{-c^2 n^2 \pi^2 t/25}$

5. $u(x, t) = \frac{5}{2} - \frac{4l}{\pi^2} \sum_1^{\infty} \frac{1}{(2n-1)^2} \cos \frac{(2n-1)\pi x}{l} e^{-(2n-1)^2 c^2 \pi^2 t/25}$

6. $u(x, t) = 50 - \frac{400}{\pi^2} \sum_1^{\infty} \frac{2}{(2n-1)^2} \cos \frac{(2n-1)\pi x}{50} e^{-c^2 \pi^2 (2n-1)^2 t/2500}$

7. $0 = \frac{40_0}{\pi} \left[e^{-(\pi/2l)^2 kt} \cos \frac{\pi x}{2l} - \frac{1}{3} e^{-(3\pi/2l)^2 kt} \cos \frac{3\pi}{2l} x + \frac{1}{5} e^{-(5\pi/2l)^2 kt} \cos \frac{5\pi}{2l} x - \dots \right]$

8. $V = V_0 e^{-\sqrt{(n/2k)x}} \sin [nt - \sqrt{(n/2k)} x]$.

Problems 18.4, page 623

1. $u = -\frac{8}{\pi} \sum_{n=1, 3, 5, \dots}^{\infty} \frac{\sin nx \sinh n(\pi - y)}{n(n^2 - 4) \sinh nx}$ 5. $u(x, y) = \frac{3200}{\pi^3} \sum_1^{\infty} \frac{\sin \frac{(2n-1)\pi x}{20} \sinh \frac{(n-1)\pi y}{20}}{(2n-1)^2 \sinh (2n-1)\pi}$

8. $u(x, y) = u_0 \cosh \frac{\pi x}{a} \cosh \frac{\pi}{a} (b-y) \operatorname{sech} \frac{\pi b}{a}$.

Problems 18.5, page 626

1. $u(r, \theta) = \frac{8k}{\pi} \sum_1^{\infty} \left(\frac{r}{a} \right)^{2n-1} \frac{\sin (2n-1)\theta}{(2n-1)^3}$ 2. $u(r, \theta) = \frac{3200}{\pi^2} \sum_1^{\infty} \left(\frac{r}{10} \right)^{2n-1} \frac{\sin (2n-1)\theta}{(2n-1)^3}$

3. $u(r, \pi) = \frac{2}{\pi} \sum_{n=1, 3, 5, \dots}^{\infty} \left(\frac{a}{r} \right)^{2n} \frac{r^{4n} - b^{4n}}{a^{4n} - b^{4n}} \cdot \frac{\sin 2n\theta}{n^3}$ 4. $u(r, \theta) = \sum \frac{2k}{n\pi} \left(\frac{r}{a} \right)^{4n} (1 - \cos n\pi) \sin 4n\theta$

5. $u(r, \theta) = 50 - \frac{200}{\pi} \sum_1^{\infty} \frac{1}{2n-1} \left(\frac{r}{a} \right)^{2n-1} \sin (2n-1)\theta$

6. $u(r, \theta) = \cos \theta \left(\frac{200}{r} - \frac{r}{2} \right) + \sin \theta \left(2r - \frac{200}{r} \right)$. 7. $u(r, \theta) = 4 \cos \theta (r - 1/r) + 4 \sin \theta (r + 1/r)$.

Problems 18.6, page 630

1. $u = \sum_{m=1}^{\infty} \frac{J_2(\alpha_m)}{\alpha_m^2 J_1^2(\alpha_m)} \cos \alpha_m t J(\alpha_m r)$.

Problems 18.7, page 634

1. $e = e_0 \sin \frac{\pi x}{l} \cos \frac{\pi t}{l\sqrt{LC}}$; $i = i_0 - e_0 \sqrt{\left(\frac{C}{L}\right)} \cos \frac{\pi x}{l} \sin \frac{\pi t}{l\sqrt{CL}}$

3. $v = \frac{20(l-x)}{l} + \frac{24}{\pi} \sum_{n=1}^{\infty} \frac{(-1)^{n+1}}{n} \sin \frac{n\pi x}{l} \exp(-n^2\pi^2 t / RCl^2)$

$$i = \frac{20}{IR} + \frac{24}{IR} \sum_{n=1}^{\infty} (-1)^n \frac{n\pi x}{l} \exp(-n^2\pi^2 t / RCl^2)$$

4. $v = V_0 \cos(pt - px\sqrt{LC})$.

Problems 18.9, page 638

1. $\frac{\partial^2 v}{\partial x^2} = LC \frac{\partial^2 v}{\partial t^2}, \frac{\partial^2 i}{\partial t^2} = LC \frac{\partial^2 i}{\partial x^2}$

2. $\frac{\partial u}{\partial t} = c^2 \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} + \frac{\partial^2 u}{\partial z^2} \right)$

3. If $u(x, t)$ is the temperature, then temperature gradient at a point is $\partial u / \partial x$ for all t .

4. elliptic

6. $u = \frac{10}{l}x + 30$

5. $\partial^2 y / \partial t^2 = c^2 \partial^2 y / \partial x^2$

8. $r^2 \frac{\partial^2 u}{\partial r^2} + r \frac{\partial u}{\partial r} + \frac{\partial^2 u}{\partial \theta^2} = 0$

9. $y = \frac{2h}{l}x, 0 < x < \frac{l}{2}; y = \frac{l}{2h}(2h - y), \frac{l}{2} < x < l$

10. $y(0, t) = 0, y(l, t) = 0, \left(\frac{\partial y}{\partial t} \right)_{t=0} = 0$

11. zero

12. $u(0, y) = 0, v(a, y) = 0, 0 < y < a; u_a(x, 0) = 0$ for all t and $u(x, a) = u$ for $0 < x < a$

13. $\frac{\partial u(0, t)}{\partial x} = 0, \frac{\partial u(l, t)}{\partial x} = 0$ for all t

14. $y(x, t) = f(x + ct) + f(x - ct)$

15. $\frac{\partial u}{\partial t} = c^2 \left(\frac{\partial^2 u}{\partial x^2} + \frac{\partial^2 u}{\partial y^2} \right)$ where c^2 is the diffusivity

16. $u(x) = x^2 + 20$

17. § 18.8-(6), (7), (8)

18. $u = 8e^{-12x-3y}$

19. $z = 4e^{3x+t}$

20. $\alpha^2 (= k/s\rho)$ is called the diffusivity of the substance (cm^2/sec)

21. $\frac{\partial^2 v}{\partial x^2} = RC \frac{\partial v}{\partial t}, \frac{\partial^2 i}{\partial x^2} = RC \frac{\partial i}{\partial t}$

22. $u(x, t) = \sum_{n=1}^{\infty} b_n \sin \frac{n\pi x}{l} e^{-c^2 n^2 \pi^2 t / l^2}$

23. § 18.7-(3), (4), (5)

25. False.

Problems 19.1, page 646

1. (i) $\sqrt{2} \left(\cos \frac{\alpha}{2} + \sin \frac{\alpha}{2} \right) \cos \left(\frac{\pi}{4} - \frac{\alpha}{2} \right)$. (ii) $-8i/25$

2. $\frac{-y}{x^2 + y^2 - 2x + 1}$

3. $x = \pm 1.5, y = \pm 2$

5. A circle: centre $(-1, 1)$ radius $\sqrt{2}$

8. $-1 + i\sqrt{3}, -1 - i\sqrt{3}, 1 - i\sqrt{3}; 4\sqrt{3}$

9. $-2 + 0i, 1 - i\sqrt{3}$

10. $-1 - i, \sqrt{2}(\mp \sin 15^\circ \pm i \cos 15^\circ), \sqrt{2}(\mp \cos 15^\circ \pm i \sin 15^\circ)$

11. (i) Annular region between the circles of radii 2 and 4 with centre $(-3, 0)$ including boundary of inner circle; (ii) Region of complex plane above the line $y = 2$; (iii) Infinite region bounded by the lines $\theta = \pi/3$ and $\theta = \pi/2$; (iv) Real axis and region above it between $x = \pm 2$
13. (i) Ellipse with foci at $z = \pm 1$ and major for axis = 3
(ii) (a) Right bisector of the line joining $z = 3$ and $z = -1$;
(b) Circle through the points $z = 3$ and $z = -1$;
14. (i) Right bisector of the points 0 and 2; (ii) Circle through the points $\frac{1}{3}$ and 3
15. (i) A straight line; (ii) Circle with centre $(1, 1/2)$ and radius $\sqrt{5/2}$.

Problems 19.2, page 650

5. $4m\pi/n(n+1)$

7. $2^{n+1} \sin^n \frac{\alpha-\beta}{2} \cos n \left(\frac{\pi+\alpha+\beta}{2} \right).$

Problems 19.3, page 653

1. (i) $(2)^{1/8} [0.98 \pm i(0.195)]i6; (2)^{1/2} [-0.195 \pm i(0.98)]$
(ii) $(2)^{1/5} \cos \frac{4n+3}{10}\pi$, where $n = 0, 1, 2, 3, 4$; (iii) $\pm 2\sqrt{2}$
(iv) $2^3\sqrt{2} \cos r\pi/9$, where $r = 1, 7$ or 13
3. $\pm i, \frac{1}{2}(\sqrt{3} \pm i), \frac{1}{2}(-\sqrt{3} \pm i)$
5. (i) $1, -1, \cos(\pm \pi/5), \cos(\pm 3\pi/5)$
(ii) $-1, \frac{1}{2}(1 \pm i\sqrt{3}), \pm(1+i)/\sqrt{2}, \pm(-1+i)/\sqrt{2}$
(iii) $\frac{1 \pm i}{\sqrt{2}}, \frac{-1 \pm i}{\sqrt{2}}; 1, \cos\left(\pm \frac{2\pi}{5}\right), \cos\left(\pm \frac{4\pi}{5}\right)$.
(iv) $\cos(2n+1)\pi/6$, where $n = 0, 1, 2, 3, 4, 5$; $2(2m+1)\pi/3$, where $m = 0, 1, 2$
6. $(-1+i)/\sqrt{2}, (1-i)/\sqrt{2}$
7. $\pm 1, \pm i, \pm \left(\cos \frac{\pi}{6} \pm i \sin \frac{\pi}{6} \right), \pm \left(\cos \frac{\pi}{3} \pm i \sin \frac{\pi}{3} \right)$; Last four values
9. $x^3 + x^2 - 2x - 1 = 0$.

Problems 19.4, page 655

1. $32 \cos^5 \theta - 24 \cos^3 \theta + 6 \cos \theta$
13. $-(2)^{-11} (\sin 120 - 2 \sin 100 - 4 \sin 80 + 10 \sin 60 + 5 \sin 40 - 20 \sin 20)$
14. $\sin^5 \theta = A \sin \theta - B \sin 3\theta + C \sin 5\theta$.

Problems 19.5, page 661

1. (i) $e^{x^2-y^2} \cos 2xy, e^{x^2-y^2} \sin 2xy$ (ii) ie^5 . (iii) $e^{16} \cos 30, e^{16} \sin 30$
5. $[(pq' - p'q)(qr' - q'r)]^2 = [(pq' - p'q)^2 + (qr' - q'r)^2](pr' - p'r)^2$
10. $\frac{1}{64} (\cosh 7\theta + 7 \cosh 5\theta + 21 \cosh 3\theta + 35 \cosh \theta)$
17. $-\log^3$ 18. $-13/12$.

Problems 19.6, page 664

10. $\pm \frac{\pi}{4} + \frac{i}{4} \log \frac{1+\sin\theta}{1-\sin\theta}$ according as $\cos\theta$ is + ve or - ve

11. $\sin^{-1}(\sqrt{\sin\theta}) + i \log [\sqrt{(1+\sin\theta)} - \sqrt{\sin\theta}]$.

Problems 19.7, page 667

1. (i) $\log_e 10 + i[\tan^{-1}(4/3) \pm 2n\pi]$; (ii) $\log_e 1 + i(\pi + 2n\pi)$

4. (i) $\sqrt{2}e^{-(2n-\frac{1}{4})\pi}, (2n-\frac{1}{4})\pi + \log \sqrt{2}$; (ii) $e^{-\pi^2/8}, (\pi/4) \log_e 2$

9. $\sqrt{[\frac{1}{2}(\cos 2x + \cosh 2y)]} - i \tan^{-1}(\tan x \tanh y)$

10. (i) $2nx \pm i \log(2 + \sqrt{3})$; (ii) $-\frac{1}{2} \log 3 + (n + \frac{1}{2})i\pi$.

Problems 19.8, page 669

1. $e^{\sin\theta \cos\theta} \cos(\theta + \sin^2\theta)$

2. $\sin\alpha \cos(\cos\beta) \cosh(\sin\beta) - \cos\alpha \sin(\cos\beta) \sinh(\sin\beta)$

3. $\tan^{-1} \frac{x \sin\alpha}{1+x \cos\alpha}$, except when $x = 1$ and $\alpha = (2n+1)\pi$ 4. $\log(2 \cos\theta/2)$

5. $-\frac{1}{2} \tan^{-1}(\cos\beta \operatorname{cosech}\alpha)$

6. $\frac{1}{2} \tan^{-1} \frac{2c \sin\alpha}{1-c^2}$

7. $(2 \cos\theta)^{-1/2} \cos\theta/2$

8. $\sin \frac{n(\pi-\alpha)}{2} / (2 \sin \alpha/2)^n$

9. $\sin\left(\alpha + \frac{n-1}{2}\beta\right) \sin \frac{n\beta}{2} \operatorname{cosec} \frac{\beta}{2}$

10. $\frac{\cos\{\alpha + \frac{1}{2}(n-1)\beta\} \sin n \frac{\beta}{2}}{\sin \frac{1}{2}\beta}$

11. $\frac{\sin\alpha(\cos\alpha - \sin\alpha)}{1 - \sin 2\alpha + \sin^2\alpha}$

12. $\frac{1 - x \cos\theta - x^n \cos n\theta + x^{n+1} \cos n-1\theta}{1 - 2x \cos\theta + x^2}$.

33. False.

Problems 20.1, page 682

4. $a = 1, b = -6, c = 1, d = 2, e = 4$

6. (i) and (ii) Not analytic. (iii) Analytic

7. $p = -1$

11 & 12. $f(z)$ is not analytic at origin although C-R equations are satisfied there

14. (i) $z^3 + 3z^2 + 1 + iz$; (ii) $\cos z$; (iii) $\log z$; (iv) i/z ; (v) $e^z + i(c-z)$; (vi) $ze^{2z} + ic$; (vii) $z \sin z$; (viii) $x^2e^z + ic$

15. (i) $(1+i)/z + c$; (ii) $\cos z + c$; (iii) e^z ; (iv) $\bar{z}e^{-\bar{z}} + c$; (v) $1 + ize^{-z}$; (vi) $(2 \cos x \cosh y)/(\cos 2x + \cosh 2y)$

16. (i) $f(z) = c - iz^3$; (ii) $f(z) = \left(\frac{1}{2} - \cot \frac{z}{2}\right)$; (iii) $\frac{\cot z}{1+c} + c\left(\frac{1+3i}{5}\right)e^z + c$

17. $\psi = 3xy^2 - x^3 + c$

18. $2 \tan^{-1}(y/x); 2 \log z + c$

20. $v = C - e^{-2xy} \cos(x^2 - y^2); f(z) = C - ie^{iz^2}$

22. (i) $x^4 - 6x^2y^2 + y^4 = c$; (ii) $x^2 - y^2 + 2e^x \sin y = c$; (iii) $r^2 \sin 2\theta = c'$

23. (i) $x/(x^2 + y^2)$; (ii) $\frac{1}{2} \log(x^2 + y^2)$

24. (i) $a(1 + \cos \theta + i \sin \theta \log r)$; (ii) $(r + 1/r) \cos \theta + (r - 1/r) \sin \theta + c$

27. $-2 \tan^{-1}[(y-2)(x-1)], 2i \log(z-1-2i)$.

Problems 20.2, page 687

1. $z = \pm i$

2. $w = -1/z$

3. $w = (2i - 6z)/(iz - 3)$; fixed points $z = i, 2i$; no critical points

4. $w = \frac{(20 + 18i) - (32 + 12i)z}{(29 + 17i) - (11 - 3i)z}$

5. (i) $w = i(1-z)/(1+z)$; (ii) $w = \frac{(4i-2)+(5-3i)z}{2i+(1+i)z}$; (iii) $w = (1-z)/(1+z)$.

Problems 20.3, page 692

1. (i) $I(w) > 0$; (ii) Region bounded by the parabolas $v^2 = 4(1 \pm u)$; and $u^2 = 1 - 2v$; (iii) Region bounded by parabolas $v^2 = \frac{1}{4} \pm u$, $v^2 = 4(1 \pm u)$; (iv) Region boundary $\rho = 2 \sqrt{\rho} \cos \frac{\phi}{2} + 3$.

2. $w = z^6$

3. Lines parallel to x and y axes map into two families of rectangular hyperbolae in the w -plane which cut each other at right angles. Lines parallel to u and v axes map into two families of parabolae in the z plane which cut each other orthogonally. It is conformal at $z = 0$.

4. (a) Line $4v + 1 = 0$

5. (b) Every circle through the origin ($z = 0$) transforms into a st. line not passing through the origin ($w = 0$). If a line passes through $z = 0$, its image is a line through $w = 0$. (b) Circle with centre $(1/2, 1/2)$ and radius $(1/\sqrt{2})$ (c) Lemniscate $\rho^2 = \cos 2\phi$

10. $z = \pm a$

11. See § 20.10 (3)

14. See § 20.10(4).

Problems 20.4, page 694

1. $z = \cosh w$

3. $w = \sin z$

4. $w = \log z$.

Problems 20.5, page 696

1. (a) $(5-i)/6$ (b) $(5+i)/6$

2. (i) $4 + (25/3)i$; (ii) $4 + 8i$

 2. 0
 5. (a) $-10\pi i$ (b) $2\pi ie$
 8. (i) 0 ; (ii) $2\pi(6 + 13i)$; (iii) $12\pi i$
3. (a) zero ; (b) zero
 6. (i) $4\pi i$; (ii) $2\pi ie^{-1}$; (iii) $-\pi i$
 9. zero.

Problems 20.7, page 709

1. $\sum_{n=1}^{\infty} (-1)^{n+1} n(z-1)^n$; Convgt. in $|z-1| < 1$
2. $f(z) = \frac{1}{3} + \frac{u}{9}(z+i) - \frac{7}{27}(z+1)^2 + \dots$. Region of convergence is $|z+i| < 1$
3. (i) $\frac{1}{2}(z-1) - \frac{1}{2^2}(z-1)^2 + \frac{1}{2^3}(z-1)^3 - \dots$ (ii) $-(z-\pi/2) + (z-\pi/2)^3/3! - (z-\pi/2)^5/5! + \dots$
 (iii) (a) $f(z) = -\frac{1}{5} \sum_{n=0}^{\infty} (-1)^n (z+1)^n - \frac{1}{20} \sum_{n=0}^{\infty} \left(\frac{z+1}{4}\right)^n$ in the region $|z+1| < 1$. Also, $(z+1) < 4$
 (b) $f(z) = -\frac{1}{5} \sum_{n=0}^{\infty} \left(\frac{z-1}{5}\right)^n - \frac{1}{10} \sum_{n=0}^{\infty} \left(\frac{z-1}{2}\right)^n$ in the region $|z-1| < 2$. Also $|z-1| < 3$
4. (i) $\frac{1}{z+1} + \frac{1}{(z+1)^2} + \frac{1}{(z+1)^3} + \dots + \frac{1}{2} \left[1 + \frac{z+1}{2} + \frac{(z+1)^2}{2^2} + \frac{(z+1)^3}{2^3} \right]$
 (ii) $\frac{1}{4z} \left(1 + \frac{1}{z} + \frac{1}{z^2} + \dots \right) - \frac{1}{12} \left(1 - \frac{z}{3} + \frac{z^2}{9} - \dots \right)$. (iii) $-\frac{1}{2(z-1)} - 3 \sum_{n=1}^{\infty} \frac{(z-1)^{n-1}}{2^{n+1}}$
5. (i) $e \left[(z-1)^{-2} + (z-1)^{-1} + \frac{1}{2!} + \frac{1}{3!}(z-1) + \frac{1}{4!}(z-1)^2 + \dots \right]$
 (ii) $e^2(z-1)^{-3} + 2e^2(z-1)^{-2} + 2e^2(z-1)^{-1} + \frac{4e^2}{3} + \frac{2e^2}{3}(z-1) + \dots$
6. (i) $\sum_{n=1}^{\infty} (-1)^{n-1} n \cdot (z-1)^{-n}$ for $|z-1| > 1$. (ii) $-\sum_{n=2}^{\infty} \frac{z^{2n-5}}{2(n-1)!}$
7. (i) $1 + \frac{3}{z} \left(1 - \frac{2}{z} + \frac{2^2}{z^2} - \frac{2^3}{z^3} + \dots \right) - \frac{8}{3} \left(1 - \frac{z}{3} + \frac{z^2}{3^2} - \frac{z^3}{3^3} + \dots \right)$
 (ii) $\frac{2}{z+2} + \frac{3}{(z+2)^2} + \frac{3^2}{(z+2)^3} + \dots + \frac{1}{5} \left(1 + \frac{z+2}{5} + \frac{(z+2)^2}{5^2} + \frac{(z+2)^3}{5^3} + \dots \right)$
 (iii) (a) $\frac{7}{z} - \frac{9}{z^2} - \frac{45}{z^3} - \frac{81}{z^4} + \dots$ (b) $\frac{5}{2(z-3)} + \frac{7}{12} - \frac{z-3}{24} - \frac{5(z-3)^2}{432} + \frac{7(z-3)^2}{864} + \dots$
8. (a) $\frac{z}{4} - \frac{5z^2}{16} + \frac{21}{64}z^5 - \dots$; (b) $\frac{1}{3} \left(\frac{1}{z^5} - \frac{1}{z^3} - \frac{z}{4} + \frac{z^3}{16} - \frac{z^5}{64} + \dots \right)$; (c) $\frac{1}{z^3} - \frac{3}{z^5} + \dots$
9. $z = 0, z = 2$ are the isolated singularities
 10. $z = 0$ is an isolated essential singularity
 11. $z = 0$, is a non-isolated essential singularity
 12. $z = 1$ is a pole of order 2
 13. $z = 1$ is a pole of order 4
 14. $z = a$ is a double pole and $z = 0, \pm 1, \pm 2, \dots$ are simple poles.

Problems 20.8, page 715

1. $-\frac{1}{t} - 2i + 3t + 4i t^2 + \dots$ where $t = z-i-1$

2. (i) $3e/2$; (ii) $\operatorname{Res}(z = -ai/2)$
3. (i) $\operatorname{Res} f(0) = -1/2$, $\operatorname{Res} f(2) = 2\frac{1}{2}$;
(ii) $\operatorname{Res} f(-1) = 0$, $\operatorname{Res} f(i) = \frac{1+2i}{2(1-i)}$, $\operatorname{Res} f(-i) = \frac{2i-1}{2(i-1)}$
(iii) $\operatorname{Res} f(-1) = 1$, $\operatorname{Res} f(i) = \frac{2+i}{-1+i}$, $\operatorname{Res} f(-i) = \frac{-2+i}{1+i}$
4. (i) $\operatorname{Res} f(0) = -4/3$; (ii) $\operatorname{Res} f(i) = \frac{1}{2}e^{-1}$; $\operatorname{Res} f(-i) = \frac{1}{2}e$; (iii) $-i\pi/4$, $\operatorname{Res} f(n\pi) = 1$, n an integer.
5. (i) 0; (ii) $16\pi i/(2+3i)$
6. (i) $\frac{\pi ie^{-4}}{5}$ (ii) 0; (iii) $i\pi/4$ 7. (i) πi ; (ii) $\pi/2(3+2i)$, (iii) zero.
8. (i) $-2\pi i$; (ii) πi ; (iii) $\pi/16$
9. (i) $-2\pi i$; (ii) $8\pi i/3e^2$; (iii) $\frac{\pi e^{2i}}{2}$; (iv) $\frac{8\pi}{3}ie^{-2}$
10. (i) $\frac{21\pi i}{16}$; (ii) $2\pi i \sec 1(1 + \tan 1)$; (iii) $-2\pi i$
11. $2\pi i$ 12. $\frac{1}{z^3} - \frac{1}{6z} + \frac{7z}{360} - \frac{31z^5}{15120} + \dots; -\frac{1}{3}\pi i$.

1. Die is biased
 2. No
 4. 8.91% and 15.07%
 5. Consistent
 7. 37.5%; 30.3 and 44.7 respectively
 8. No
 9. Difference is not significant
 10. $Z = 6.56$ so that the difference is significant
 11. No.

Problems 27.2, page 904

1. No
 2. Mean weight lies between 64.6 and 69.4 lbs.
 3. 0.0774
 5. 62
 6. 2.696
 8. No
 9. (i) Yes, (ii) No
 10. Yes.

Problems 27.3, page 910

1. 0.25
 2. $t = 0.62$, Yes
 4. Refute the claim
 5. Process is not under control
 7. Sample mean = 575.2 kg., S.E. = 2.75 kg
 8. Accept null hypothesis
 9. Yes with 75% confidence.
 10. No
 11. No
 12. No

Problems 27.4, page 914

1. 0.41
 2. Hypothesis is correct
 3. Significant at 5% level
 4. Yes
 5. $f_o:$ 33.82 161.78 315.98 308.48 150.54 29.4
 $\chi^2 = 7.97$. Binomial distribution gives a good fit at 5% level
 6. $f_o:$ 305 365 210 80 18 12
 $f_e:$ 301.2 361.4 216.8 86.7 26 7.9 ; $\chi^2 = 3.097$
 Poisson distribution gives a good fit at 5% level
 7. $f_o:$ 314 355 204 85 29 12
 $f_e:$ 301 362.2 217.3 86.9 26.1 6.5
 Poisson distribution can be fitted to the data
 8. $\chi^2 = 1.2$. The fit is quite good at 5% level.

Problems 27.5, page 917

1. First variance cannot be regarded as significantly greater than the second
 2. Not significant as $F = 2.1$ and $F_{0.05} = 4.15$
 4. Not significant as $F = 2.4$ and $F_{0.01} = 3.2$
 5. Product of firm B cannot be said to be of better quality than those of firm A.

6. Not significant at 1% level and just significant at 5% level as $F = 2$, $F_{0.01} = 2.62$ and $F_{0.05} = 1.98$
 7. $F = 1.49$, Not-significant 8. $F = 1.025$; Yes

 (iii) $y_{x+3} - 6y_{x+2} + 11y_{x+1} - 6y_x = 0$.

Problems 31.2, page 1002

1. $u_p = (c_1 + c_2 p) 3p$ 2. $y_n = c_1 \cos \frac{2n\pi}{3} + c_2 \sin \frac{2n\pi}{3}$ 3. $u_n = c_1 \cos n\pi/2 + c_2 \sin n\pi/2$
 4. $y_n = c_1 \cdot 2^n + c_2 \cdot 3^n$. 5. $y_n = (2)^{n-1} + (-2)^{n-1}$ 6. $u_k = c_1 (-1)^k + (c_2 + c_3 k) 2^k$.
 7. $f(x) = (c_1 + c_2 x)(-1)^x + c_3 \cdot 2^x$ 8. $u_n = 2n + (-2)^n$. 9. $y_n = 6 + (n-3) 2^n$
 10. $u_n = 2^{n/2} [c_1 \cos n\pi/4 + c_2 \sin n\pi/4]$
 11. $y_m = 2^m \left\{ c_1 \cos \frac{m\pi}{4} + c_2 + \sin \frac{m\pi}{4} + c_3 \cos \frac{3m\pi}{4} + c_4 \sin \frac{3m\pi}{4} \right\}$ 14. $y_n = c_1 (-1)^n + c_2 (10)^n$

Problems 31.3, page 1005

1. $y_n = c_1(-1)^n + c_2(6)^n - 2^n/12$

2. $y_n = \left(\frac{n}{15} - \frac{1}{25}\right)(-3)^n + \frac{2^n}{25}$

3. $y_p = c_1 + c_2 p + c_3 p^2 + \frac{1}{6} p(p-1)(p-2)$

4. $y_n = 2^n \left(\frac{2}{\sqrt{3}} \sin \frac{n\pi}{3} - 2 \cos \frac{n\pi}{3}\right) + 2$

5. $y = c_1 + c_2 \cdot 3^x + \frac{1}{2} x \cdot 3^{x-1}$

6. $y_x = (c_1 + c_2 x) 2^x + 3x(x-1) 2^{x-3} + 5 \cdot 4^{x-1}$

7. $u_n = c_1 + c_2 (-1)^n + \frac{1}{2} \frac{\cos\left(\frac{n}{2}-1\right) - \cos\frac{n}{2}}{1-\cos 1}$

8. $y_p = c_1 \cos \frac{p}{2} + c_2 \sin \frac{p}{2} + \frac{p \cos\left(p - \frac{1}{2}\right)}{2 \sin \frac{1}{2}}$

9. $y_x = c_1 + 2^x + c_2 (-2)^x - \frac{1}{27} (9x^2 + 12x + 11)$

10. $y_n = c_1(-1)^n + c_2 \cos \frac{n\pi}{3} + c_3 + \sin \frac{n\pi}{3} + \frac{1}{2} n(n-3)$

11. $y_n = (c_1 + c_2 n)(3)^n + c_3(-1)^n + \frac{1}{3}(2)^n - \frac{3n}{4}$ 12. $y_n = (c_1 + c_2 n) 2^{-n} + \frac{2^n}{9} + n(n-1) \left(\frac{1}{2}\right)^{n-1}$

13. $y_n = c_1(-2)^n + c_2(-3)^n + \frac{n}{12} - \frac{7}{144}$ 14. $u_x + (c_1 + c_2 x)(-3)^x + \frac{2^x}{25}(5x-2) + \frac{2}{4} x^{x-2} + \frac{7}{16}$

15. $y_n = c_1(-2)^n + 2^n(c_2 \cos n\pi/3 + c_3 \sin n\pi/3) + \frac{3}{16}(2)^n + 2^{n-4}(2n+3)$

16. $u_n = \left\{c_1 + c_2 n + \frac{1}{48} n(n-1)^2(n-2)\right\} 2^n$. 17. $y_k = c_1 \cdot 2^k + c_2 \cdot 3^k + \frac{4^k}{2}(k^2 - 13k + 61)$

18. $y_n = 2^n \left\{(c_1 + n) \cos \frac{n\pi}{3} + c_2 + \sin \frac{n\pi}{3}\right\}$.

Problems 31.4, page 1006

1. $y_x = a + b(-1)^x + x, z_x = a + b(-1)^{x+1} - (x+1)$

2. $y_x = (a + bx)(-1)^x - \frac{1}{9} \cdot 2^{x+2}, z_x = \frac{2^x}{9} - (-1)^x [a + b(x - \frac{1}{2})]$

3. $u_n = 2.4^n - 2 \frac{1}{2} n(n-1), v_n = 4^n + 2 + \frac{1}{n} + n(n+1)$

4. $u_x = -2a + b(-2)^x - c + \frac{1}{2x}(3-x), v_x = a + c + b(-2)^x + \frac{1}{2}x(x-1).$

Problems 31.5, page 1007

1. $y_{i+1} - 2y_i + y_{i-1} = -\frac{l_m}{P} y_i$. Solve it for y_i .

Problems 31.6, page 1007

1. $y_{n+2} - 5y_{n+1} + 6y_n = 0$

2. $u_n = c_1 + c_2 n + c_3 n^2$

3. $u_n = c_1 + c_2(-2)^n + c_3(3)^n$

4. $y_n = c + 2^n$.

5. $y_n = c(2)^n - (n+1)$

6. $(x^2 + x)y_{x+2} - (2x^2 + 4x)y_{x+1} - (x^2 + 3x + 2)y_x = 0$

7. $y_n = c(2)^k + 1$

8. $y_n = (2)^{n+2} + (-2)^{n-1}$

9. Third

10. $(x+2)y_{n+2} - 2(n+1)y_{n+1} + ny_n = 0$

11. Second

12. $y_n = (C_1 + C_2 n)2^n$

13. $\frac{1}{2}x(x-1)(3)^{x-2}$

14. $y_{n+2} - 6y_{n+1} + 9y_n = 0$

15. True.

Problems 32.1, page 1012

1. $y = 1 - \frac{x^2}{2} + \frac{x^4}{8} - \frac{x^6}{48}$

2. 0.0214

3. $y = \frac{1}{3}x^3 - \frac{1}{81}x^9 + \dots$

 6. $X = 2, Y = 4.5$; max. profit = ₹ 37
 7. $A = 1.18$ units, $B = 0.53$ units; max. profit = ₹ 14.50 approx.
 8. 2000/11 units of product A and 1000/11 units of B; max. profit = ₹ 10,000
 9. $x_1 = 4, x_2 = 0$; max. $Z = 8$ 10. Unbounded solution
 11. $x_1 = 2, x_2 = 4$; min. $Z = 64$
 12. Production cost will be min. if G and J run for 12 and 4 days respectively.

Problems 34.3, page 1074

1. Max. $Z = 3x_1 + 5x_2 + 8x_3$; subject to $2x_1 - 5x_2 + s_1 = 6,$
 $3x_1 + 2x_2 + x_3 - s_2 = 5, 3x_1 + 4x_2 + s_3 = 3;$
 $x_1, x_2, x_3, s_1, s_2, s_3 \geq 0$
2. Min. $Z = 3x_1 + 2x_2 + 5x_3$; subject to $-5x_1 + 2x_2 + s_1 = 5,$
 $2x_1 + 3x_2 + 4x_3 - s_2 = 7, 2x_1 + 5x_3 + s_3 \geq 3$
 $x_1, x_2, x_3, s_1, s_2, s_3 \geq 0.$
3. Max. $Z = 3x_1 - 2x_2 + 4x_4 - 4x_5$; subject to
 $x_1 + 2x_2 + x_4 - x_5 + s_1 = 8, 2x_1 - x_2 + x_4 - x_5 - s_2 = 2,$
 $-4x_1 + 2x_2 + 3x_4 - 3x_5 = 6; x_1, x_2, x_4, x_5, s_1, s_2 \geq 0$
4. (i) $x_1 = 2, x_3 = 1$ (Basic); $x_2 = 0$ (Non-basic). (ii) $x_1 = 5,$
 $x_3 = -1$ (Basic); $x_2 = 0$ (Non-basic); (iii) $x_2 = 5/3, x_3 = 2/3$ (Basic); $x_1 = 0$ (Non-basic). All the three basic solutions are non-degenerate
6. Basic solutions are (i) $x_1 = 2, x_2 = 1$ (Basic) and $x_3 = 0$;
(ii) $x_1 = x_3 = 1$ (Basic) and $x_2 = 0$; (iii) $x_2 = -1, x_3 = 2$ (Basic) and $x_1 = 0$
(a) First two solutions are non-degenerate basic feasible solutions
(b) First solution is optimal and $Z_{\max} = 5.$

Problems 34.4, page 1081

1. $x_1 = 2, x_2 = 4$, max. $Z = 14$ 2. $x_1 = 0, x_2 = 20$; max. $Z = 200$
 3. $x_1 = 7/3, x_2 = 4/3$; max. $Z = 16$ 4. $x_1 = 5, x_2 = x_3 = 0$; max. $Z = 50$
 5. $x_1 = 0, x_2 = 100, x_3 = 230$; max. $Z = 1350$ 6. $x_1 = 89/41, x_2 = 50/41, x_3 = 62/41$; max. $Z = ₹ 765/41$
 7. $x_1 = 4, x_2 = 5, x_3 = 0$; min. $Z = -11$
 8. $x_1 = 280/13, x_2 = 0, x_3 = 20/13, x_4 = 180/13$; max. $Z = 2280/13$
 9. $x_1 = 0, x_2 = 400$ units; max. profit = ₹ 1200
 10. $x_1 = 125, x_2 = 250$ units; max. profit = ₹ 2250
 11. $x_1 = 400$ gms, $x_2 = 0$; min. cost = ₹ 2 12. $x_1 = 0, x_2 = x_3 = 50$; max. profit = ₹ 700

13. $x_1 = 0.5, x_2 = x_3 = 0.04$ units ; min. cost = ₹ 5.80

14. Averages for corn, wheat, soyabean are 250, 625, zero respectively to achieve a max. profit of ₹ 32,000.

Problems 34.5, page 1088

1. $x_1 = 0, x_2 = 2, x_3 = 0$; max. $Z = 4$

2. $x_1 = 3, x_2 = 2, x_3 = 0$; max. $Z = 8$

3. $x_1 = x_2 = -6/15$; max. $Z = -48/5$

4. $x_1 = 23/3, x_2 = 5, x_3 = 0$; max. $Z = 85/3$

5. $x_1 = x_2 = x_3 = 5/2, x_4 = 0$; max. $Z = 15$

6. $x_1 = 21/13, x_2 = 10/13$; max. $Z = 31/13$

7. Infeasible

8. $x_1 = 23/3, x_2 = 5, x_3 = 0$; max. $Z = 85/3$

9. $x_1 = 55/7, x_2 = 30/7, x_3 = 0$; max. $Z = 155/7$

10. $x_1 = 2, x_2 = 0$; max. $Z = 18$

11. Degenerate solution : $x_1 = 0$ (non-basic) ; $x_2 = 1, x_3 = 0$ (basic) ; max. $Z = 3$.

Problems 34.6, page 1091

1. Min. $W = 26y_1 + 7y_2$; subject to $6y_1 + 4y_2 \geq 10$

$$5y_1 + 2y_2 \geq 13, 3y_1 + 5y_2 \geq 19; y_1, y_2, y_3 \geq 0$$

2. Max. $W = 11y_1 + 7y_2 + y_3 + 5y_4$; subject to $3y_1 + 2y_2 - y_3 + 3y_4 \leq 2$,

$$4y_1 + 3y_2 + 2y_3 + 2y_4 \leq 4, y_1 - 2y_2 + 3y_3 + 2y_4 \leq 3;$$

$$y_1, y_2, y_3, y_4 \geq 0$$

3. Min. $W = -3y_1 + y_2 + 4y_3$; subject to $y_1 + 3y_2 - 2y_3 \leq -3$,

$$y_1 + y_3 \geq 16, y_1 - 2y_2 + y_3 \leq -7;$$

$$y_1, y_2 \geq 0, y_3, \text{unrestricted in sign}$$

4. Max. $W = -5y_1 + 9y_2 + 8y_3$; subject to $-2y_1 + 4y_2 - 8y_3 \leq 3$,

$$3y_1 - 2y_2 + 4y_3 \leq -2, -y_1 + 3y_3 = 1;$$

$$y_1, y_2 \geq 0, y_3 \text{ unrestricted}$$

5. Min. $y = 3y_1 + 4y_2 + y_3 + 6y_4$; subject to $5y_1 - 2y_2 + y_3 - 3y_4 \geq 2$,

$$6y_1 + y_2 - 5y_3 - 3y_4 \geq 5, -y_1 + 4y_2 + 3y_3 + 7y_4 \geq 6, y_1, y_2, y_3, y_4 \geq 0.$$

Problems 34.7, page 1094

1. $x_1 = x_2 = 0, x_3 = 5/2$; min. $Z = 2.5$

2. $x_1 = 4, x_2 = 2$; max. $Z = 10$

3. $x_1 = 7, x_2 = 0$, max. $Z = 21$

4. $x_1 = 0, x_2 = 100, x_3 = 230$; max. $Z = 1350$.

Problems 34.8, page 1097

1. $x_1 = 0, x_2 = 1$; max. $Z = -1$

2. $x_1 = 3/5, x_2 = 6/5$; min. $Z = 12/5$

3. $x_1 = 6, x_2 = 2, x_3 = 0$; min. $Z = 10$

4. $x_1 = 65/23, x_2 = 0, x_3 = 20/23, x_4 = 0$; min. $Z = 215/23$.

Problems 34.9, page 1104

1. $x_{11} = 200, x_{12} = 50, x_{22} = 175, x_{24} = 125, x_{33} = 275, x_{34} = 125$; min. cost = ₹ 12075

2. $x_{13} = 14, x_{21} = 6, x_{22} = 5, x_{23} = 1, x_{32} = 5$; min. cost = 143

3. $x_{11} = 50, x_{12} = 100, x_{21} = 150, x_{33} = 150, x_{42} = 100, x_{43} = 50$; min. tonnage = 3300

4. $x_{11} = 140, x_{13} = 60, x_{21} = 40, x_{22} = 120, x_{33} = 90$; min. cost = ₹ 5920

5. $x_{11} = 5, x_{14} = 2, x_{22} = 3, x_{23} = 7, x_{32} = 5, x_{34} = 13$;

min. cost = ₹ 799 and maximum saving = ₹ 201

6. $x_{11} = 150, x_{13} = 20, x_{22} = 160, x_{24} = 40, x_{33} = 90, x_{34} = 90$; max. profit = 4920

7. $x_{13} = 2, x_{22} = 1, x_{23} = 2, x_{31} = 4, x_{33} = 1$; min. cost = 33

8. $x_{13} = 0, x_{15} = 800, x_{21} = 400, x_{24} = 100, x_{32} = 400, x_{33} = 200$,

$x_{34} = 300, x_{43} = 300$; min. cost = 9200.

Problems 34.10, page 1109

- $x_{11} = x_{22} = x_{33} = 1$; min. cost = ₹ 18
- $A \rightarrow 2, B \rightarrow 3, C \rightarrow 4, D \rightarrow 1$; min. $Z = 38$
- $I \rightarrow B, II \rightarrow A, III \rightarrow D, IV \rightarrow C$; min. cost = ₹ 49
- $A \rightarrow$ Dyn. Prog., $B \rightarrow$ Queueing Th., $C \rightarrow$ Reg. Analysis, $D \rightarrow$ L.P.; min. time = 28 hrs
- (i) $A \rightarrow I, B \rightarrow II, C \rightarrow III, D \rightarrow IV$; (ii) $A \rightarrow I, B \rightarrow III, C \rightarrow II, D \rightarrow IV$
- $1 \rightarrow IV, 2 \rightarrow II, 3 \rightarrow VI, 4 \rightarrow I, 5 \rightarrow III, 6 \rightarrow V$; max. profit = ₹ 270

Problems 35.2, page 1120

- $y = \pm 2 \sin m\pi x$, where m is an integer
- $y = \lambda x^2 + ax + b$, where λ, a, b are determined from the isoperimetric and boundary conditions.
- $y(x) = \frac{1}{2}(1 - \cos x) + \frac{1}{4}(2 - \pi) \sin x$.

Problems 35.3, page 1124

- $y = (c_1 + c_2x) \cos x + (c_3 + c_4x) \sin x$,
 $z = (c_1 + c_2x) \cos x + (c_3 + c_4x) \sin x - 2c_2 \sin x + 2c_4 \cos x$
- $y = a_n \sin nx$, $n = 1, 2, 3, \dots$
- $y = \cos x$
- $y = -\frac{\lambda}{24\mu} (x^2 - a^2)^2$

6. (i) $y = c_1 e^{2x} + c_2 e^{-2x} + c_3 \cos 2x + c_4 \sin 2x$;
(ii) $y = c_1 + c_2 x + c_3 x^2 + c_4 x^3 + c_5 x^4 + c_6 x^5 + x^7/7!$.

Problems 35.4, page 1126

1. (i) and (ii) $\bar{y} = \frac{5}{18}x(1-x)$
2. $\bar{y} = \frac{x}{4}(5x-1)$
4. $\bar{y} = 0.58 + 0.27x$
5. (i) and (ii) $c_1 = 0.93, c_2 = -0.05$
6. 0.05
7. $c_1 = 3.27, c_2 = -2.69$
8. $y = \frac{1}{2}(5x^2 - 3x)$.

Problems 36.1, page 1134

1. $y(x) = 6x - 5 + \int_0^x (5 - 6x + 6t) y(t) dt.$
2. $y(x) = x - \sin x + e^x(x-1) + \int_0^x [\sin x - e^x(x-t)] y(t) dt$
3. $y(x) = \int_0^x t(t-x) y(t) dt + \frac{1}{2}x^2$
4. $y(x) + \int_0^x [1+x-2t+(x-t)e^{-t}] y(t) dt = \frac{x^5}{20} - \frac{5x^3}{6} + x - 3$
5. $y(x) = \cos x - \frac{1}{2}x^2 - \frac{1}{3}x^3 - \frac{1}{2} \int_0^x (x-t)^2 y(t) dt$
6. $y(x) = \sin x - \frac{1}{2} + \int_0^x \left[\frac{1}{2}x(x-t)^2 - 1 \right] y(t) dt$
7. $y(x) - \int_0^x [4 - 6(x-t) + 2(x-t)^2 - \frac{1}{6}(x-t)^3] y(t) dt = \frac{1}{4} \cos 2x - \frac{19}{12} + \frac{32}{3}x - \frac{85}{6}x^2 + \frac{20}{3}x^3$
8. $y''(x) - 2xy'(x) - 3y(x) = 0; y(0) = 1, y'(0) = 0$
9. $y''(x) - y(x) + 3 \sin x = 0; y(0) = 3, y'(0) = 0$
10. $y'''(x) + 6y(x) = 0; y(0) = 4, y'(0) = -3, y''(0) = 2$
11. $y'''(x) - 3y''(x) + 4y'(x) + 2y(x) + e^{-x} = 0; y(0) = 1, y'(0) = 2, y''(0) = 3.$

Problems 36.2, page 1137

1. $y(x) = \int_0^1 G(x, t) ty(t) dt + \frac{1}{2}x(x-1)$, where $G(x, t) = x(1-t)$, $(x < t)$ and $= t(1-x)$, $x > t$
2. $y(x) = \int_0^1 G(x, t) y(t) dt + \frac{1}{6}(x^3 - 3x + 6)$, where $G(x, t) = x$, $x < t$ and $= t$, $x > t$
3. $u(x) = \int_0^1 G(x, t) e^t u(t) dt + \frac{1}{6}(x^3 + x)$, where $G(x, t) = x(1-2t)$, $x < t$ and $= t(1-2x)$, $x > t$
4. $G(x, t) = \frac{\sinh x \sinh(t-1)}{\sinh 1}$, $x < t$ and $= \frac{\sinh t \sinh(x-1)}{\sinh 1}$, $x > t$
5. $u(x) = \lambda \int_0^1 G(x, t) t \cdot u(t) dt$, where $G(x, t) = \frac{1}{2}x\left(\frac{1}{t-t}\right)$, $x < t$ and $= \frac{1}{2} \cdot t\left(\frac{1}{x-x}\right)$, $x > t$

Problems 36.3, page 1141

5. $y(x) = \frac{1}{2}(\sin x + \sinh x)$
6. $y(x) = x^2 + \frac{1}{12}x^4$
7. $y(x) = 1$
8. $y(x) = \pm 6J_0(4x)$
9. $y(x) = J_1(2x)$ ($x > 0$)

10. $y(x) = \frac{1}{2} e^{-2x} (\cos x + 3 \sin x) - \frac{1}{2} e^{-x}$

12. $y(x) = 1 + x^2 + x^4/24.$

15. $y(x) = \frac{3\sqrt{3}}{4\pi} x^{1/3} (3x + 2).$

11. $y(x) = (1-x)e^{-x} + 1/2 \sin x$

14. $y(x) = 1/2$

Problems 36.4, page 1145

1. Has no eigen values and eigen functions

2. Eigen value $\lambda = 1/4$; eigen function is $y(x) = x^2 + 3x/2$

3. Eigen values $\lambda = 8/(\pi - 2)$; eigen function is $y(x) = \sin^2(x)$

4. Eigen value $\lambda = 1/\pi$, $y = \sin x$

5. Has no eigen values or eigen functions

6. Eigen values are $\lambda = \pm 1/\pi$; eigen functions are $y(x) = \cos x + \sin x$, $y(x) = \cos x - \sin x$

7. $y(x) = x + \frac{\lambda[(6-\lambda)x-4]}{12+\lambda^2}$

8. $y(x) = x + \frac{\lambda}{12(1-2\lambda)-\lambda^2} [10+(6+\lambda)x]$

9. $y(x) = x + \frac{\lambda}{(1-\lambda\pi)\left(1-\frac{1}{2}\lambda\pi\right)+4\lambda^2} \left\{ 2\lambda\pi + \frac{1}{2}\pi^2\left(1-\frac{1}{2}\lambda\pi\right) + \pi(1-2\lambda\pi)\sin x \right\}$

10. $y(x) = 2x - \pi + \frac{\pi^2 \sin^2 x}{\pi - 1}$

11. $y(x) = \frac{2}{2-\lambda} \sin x, \lambda \neq 2$

12. $y(x) = x + \frac{2\lambda\pi}{1+2\lambda^2\pi^2} (\lambda\pi x - 4\lambda\pi \sin x + \cos x)$

13. There is no solution to the integral equation when $\lambda = 3$

14. $\lambda_1 = 2, \lambda_2 = -2; y_1(x) = 1-x, y_2(x) = 1-3x$

15. (i) When $F(x) = x$, solution is $y(x) = x + \lambda \left\{ \frac{2\lambda\pi^2}{\lambda^2\pi^2-1} \sin x + \frac{2\pi}{\lambda^2\pi^2-1} \cos x \right\}$

(ii) When $F(x) = 1$, solution is $y(x) = 1$.

Problems 36.5, page 1148

1. $y(x) = 1 - \frac{3\lambda x}{2(3+\lambda)} (\lambda \neq -3)$

2. $y(x) = \frac{\sin x}{1+\lambda\pi}$ only if $|\lambda| < \frac{1}{\pi}$

3. $y(x) = \frac{4+2\lambda(2-3x)}{4-\lambda^2} (\lambda \neq 2)$

4. $y = e^x$

5. $y(x) = 1$

6. $y = \sin x$

7. $y(x) = 2$.

Problems 37.1, page 1154

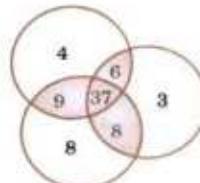

2. (i) True, since $\{a\}$ is a subset of the set $\{a, b, c\}$; (ii) and (iii) False, since the element a cannot be a subset of the set $\{a, b, c\}$; (iv) True, since the set $\{a, b\}$ is a subset of the set $\{a, b, c\}$; (v) False, since the set $\{a, b\}$ is not an element of the set $\{a, b, c\}$; (vi) True, since the null set \emptyset is a subset of every set.

p	q	$q \rightarrow p$	$p \rightarrow (q \rightarrow p)$
0	0	1	1
0	1	1	1
1	0	0	0
1	1	1	1

15. (i) Dual of $(p \wedge q) \vee r$ is $(p \wedge q) \vee r$

(ii) Dual of $(p \wedge q) \vee t$ is $(p \vee q) \wedge t$

Problems 37.3, page 1166

1. (a) $(\forall x \in A) (x + 2 < 10)$ (b) $(\exists x \in A) (x + 2 = 10)$

2. (a) $\forall x, (x^3 \neq x)$ (b) $\rightarrow x, (x + 5 \leq x)$

(c) None of the students are 26 or older (d) Some students do not live in the hostels.

3. $\forall x P(x)$ is false

4. $\forall (x_1, x_2) Q(x_1 + x_2)Q$

5. $\forall (a, b) R(a + x = b)$

6. (a) $\forall x [Q(x) \rightarrow R(x)]$ (b) $\sim \forall x [Q(x) \rightarrow R(x)]$, (c) $\exists x [Q(x) \wedge R(x)]$, (d) $\exists x [Q(x) \wedge \neg R(x)]$

8. $(\neg A \vee \neg A) \wedge (B \vee \neg A) \wedge (\neg A \vee C) \wedge (B \vee C)$

10. 1. $p \vee q$ (Premise),

2. $\neg p \rightarrow q$ (conditional equivalence)

3. $q \rightarrow s$ (Premise)

4. $\neg p \rightarrow s$ (2, 3 chain rule)

5. $p \rightarrow r$ (Premise)

6. $\neg s \rightarrow p$ (4, conditional equivalence)

7. $\neg s \rightarrow r$ (5, 6 chain rule)

8. $s \vee r$ (7, conditional equivalence)

12. (b) $x R (x = \sqrt{Z})$

13. (a) Conclusion is not valid (b) Conclusion is not valid

Problems 37.4, page 1170

1.

x	y	z	$x \wedge y$	z'	$y \wedge z'$	$(x \wedge y) \vee (y \wedge z')$
0	0	0	0	1	0	0
0	0	1	0	0	0	0
0	1	0	0	1	1	1
1	0	0	0	1	0	0
1	1	0	1	1	1	1
1	0	1	0	0	0	0
0	1	1	0	0	0	0
1	1	1	1	0	0	1

2. $x \vee z' \wedge y = x \wedge y$

3. (i) $x' \vee y' \vee z'$ (ii) 0

14.

x_1	x_2	x_3	$x_1 \vee x_3$	x_3'	$x_2 \vee x_3'$	$x_1 \wedge (x_2 \vee x_3')$	P
0	0	1	1	0	0	0	0
0	1	0	0	1	1	0	0
0	1	0	0	1	1	0	0
1	0	0	1	1	1	1	1
1	1	0	1	1	1	1	1
0	1	1	1	0	1	0	0
1	0	1	1	0	0	0	0
1	1	1	1	0	1	1	1

Problems 37.5, page 1172

1. (i) 0 (ii) 0

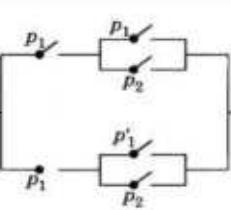

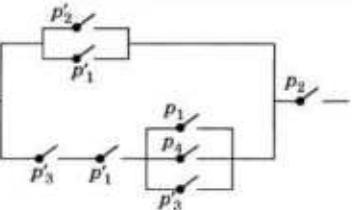

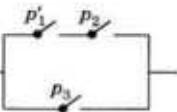

2. (i) $(x \vee y \vee z) \wedge (x \vee y \vee z')$ (ii) $x \vee y \wedge (x \vee y') \wedge (x' \vee y)$

4. $(x \vee y \vee z) \wedge (x \vee y \vee z') \wedge (x \vee y' \vee z) \wedge (x \vee y' \vee z') \wedge (x \vee y' \vee z') \wedge (x' \vee y' \vee z) \wedge (x' \vee y' \vee z')$

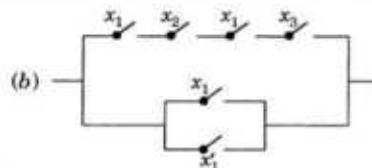

5. $(x \wedge y \wedge z) \vee (x \wedge y \wedge z') \vee (x \wedge y' \wedge z) \vee (x \wedge y' \wedge z')$

6. $F' = (x \wedge y \wedge z) \vee (x \wedge y' \wedge z) \vee (x' \wedge y \wedge z) \vee (x' \wedge y \wedge z') \vee (x' \wedge y' \wedge z)$

Problems 37.6, page 1174

1. (i) 
- (ii) 
2. (i) $p_1 \vee [p_2' \wedge (p_1 \vee p_2')]$ (ii) $[(p_1 \vee p_2) \wedge (p_1 \vee p_3)] \wedge (p_1 \wedge p_2')$ 
3. $x \wedge y$ 4. $p_1' \wedge p_2 \vee p_3$;

6. (a) $x_1 \wedge x_2'$

(c) $(x_1 \vee x_2' \vee x_3) \wedge (x_1 \vee x_2' \vee x_3') \wedge (x_3 \vee x_2' \vee x_1) \wedge (x_3 \vee x_2' \vee x_1')$

Problems 37.7, page 1179

- $F_2 = F_3$
- $F \cup G = [0.4 x_1, 0.7 x_2, 0.5 x_3, 0.9 x_4]$
 $F \cap G = [0.3 x_1, 0.6 x_2, 0.1 x_3, 0.8 x_4]$
- (i) Truth value of ' F is not rich' is 0.2
(ii) Truth value of ' G is not fat' is 0.4
(iii) Truth value of 'Mary is not beautiful' is 0.3
- (i) $F \neq G$
(ii) F is not a subset of G ; G is not a subset of F .
(iii) $F^c = [1, 1, 1, 1, 0.9, 0.7, 0.5, 0.1, 0, 0]$
 $F \cap G = [0, 0.1, 0.3, 0.5]$
 $F \cup G = [0.1, 0.5, 0.9, 1, 0.9, 0.9, 1, 1]$
- (i) Truth value of the conjunction of 'Latif and John are good players' is 0.6.
(ii) Truth value of the disjunction of 'Latif and John are good players' is 0.7.
- Members and its degree of membership.

Problems 38.1, page 1186

1. (i) $\frac{d\phi}{dt} = \frac{d\phi}{dx^i} \cdot \frac{dx^i}{dt}$; (ii) $x^i x^i$

2. (i) $a_{11}(x^1)^2 + a_{22}(x^2)^2 + a_{33}(x^3)^2 + (a_{12} + a_{21})x^1 x^2 + (a_{13} + a_{31})x^1 x^3 + (a_{23} + a_{32})x^2 x^3$

(ii) $g_{11}(dx^1)^2 + g_{22}(dx^2)^2 + g_{33}(dx^3)^2 + 2g_{12}dx^1 dx^2 + 2g_{23}dx^2 dx^3 + 2g_{31}dx^3 dx^1$.

(iii) $g_{11} = g_{12} g^{2p} + \dots + g_{in} g^{np}$

3. (i) δ_k^l ; (ii) δ_e^p .

6. (i) $\bar{A}_p^{qr} = \frac{\partial \bar{x}^q}{\partial x^j} \frac{\partial \bar{x}^r}{\partial x^k} \frac{\partial x^i}{\partial \bar{x}^p} A_i^{jk}$; (ii) $\bar{C}_{pq} = \frac{\partial x^m}{\partial \bar{x}^p} \frac{\partial x^n}{\partial \bar{x}^q} C_{mn}$

7. Yes, A_{kl}^j , contravariant order 3, covariant order 2, Rank 5

9. (a) $2\rho \cos^2 \phi - z \cos \phi + p^2 \sin^2 \phi \cos^2 \phi, -p^2 \sin 2\phi + pz \sin \phi + p^4 \sin \phi \cos^3 \phi, pz \sin \phi;$

(b) $2r \sin^2 \theta \cos^2 \phi - r \sin \theta \cos \theta \cos \phi + r^3 \sin^4 \theta \sin^2 \phi \cos^2 \phi + r^2 \sin \theta \cos^2 \theta \sin \phi;$

$2r^2 \sin \theta \cos \theta \cos^2 \phi - r^2 \cos^2 \theta \cos \phi + r^4 \sin^3 \theta \cos \theta \sin^2 \phi \cos^2 \phi - r^3 \sin^2 \theta \cos \theta \sin \phi;$

$-2r^2 \sin^2 \theta \sin \phi \cos \phi + r^2 \sin \theta \cos \theta \sin \phi + r^4 \sin^4 \theta \sin \phi \cos^3 \phi$

11. $(a \cos \phi + b \sin \phi) \sin \theta + c \cos \theta; ((a \cos \phi + b \sin \phi) \cos \theta - c \sin \theta)/r; (b \cos \phi - a \sin \phi)/r \sin \theta.$

Problems 38.2, page 1189

6. Rank = 1

Problems 36.3, page 1193

1. $g = 4, g^{11} = 2, g^{22} = 5, g^{33} = 1.5, g^{12} = 3, g^{23} = -2.5, g^{13} = -1.5,$

2. $g_{11} = 1, g_{22} = p^2, g_{33} = 1, g_{ij} = 0 (i \neq j); g^{11} = 1, g^{22} = p^{-2}, g^{33} = 1, g^{ij} = 0 (i \neq j)$

3. $g = r^4 \sin^2 \theta / (1 - r^2/R^2); g^{11} = 1 - r^2/R^2, g^{22} = 1/r^2, g^{33} = (r \sin \theta)^{-2}, g^{ij} = 0 (i \neq j).$

Problems 38.4, page 1199

1. (a) $[ii, i] = \frac{1}{2} \frac{\partial g^{ij}}{\partial x^i}$, $[ii, k] = -\frac{1}{2} \frac{\partial g_{ik}}{\partial x^k}$,

$$[ik, k] = [ki, k] = \frac{1}{2} \frac{\partial g_{kk}}{\partial x^i}, [ij, k] = 0, \text{ when } i, j, k \text{ are all different}$$

(b) $\begin{Bmatrix} i \\ ii \end{Bmatrix} = \frac{1}{2} g^{ij} \frac{\partial g_{ii}}{\partial x^j}, \begin{Bmatrix} k \\ ii \end{Bmatrix} = -\frac{1}{2} g^{kk} \frac{\partial g_{ii}}{\partial x^k}$

$$\begin{Bmatrix} k \\ ik \end{Bmatrix} = \begin{Bmatrix} k \\ ki \end{Bmatrix} = \frac{1}{2} g^{kk} \frac{\partial g_{kk}}{\partial x^i} \quad (\text{no summation over } i \text{ or } k)$$

$$\begin{Bmatrix} k \\ ij \end{Bmatrix} = 0, \text{ when } i, j, k \text{ are all different}$$

2. (a) All are zero

(b) $[21, 2] = \rho = [12, 2]; [22, 1] = \rho$, all others are zero

(c) $[21, 2] = r = [12, 2]; [31, 3] = r \sin^2 \theta = [13, 3]; [32, 3]$
 $= r^2 \sin \theta \cos \phi = [23, 3]; [22, 1] = -r; [33, 1] = -r \sin^2 \theta;$
 $[33, 2] = -r^2 \sin \theta \cos \phi$; all others are zero

3. (a) All are zero

(b) $\begin{Bmatrix} 1 \\ 22 \end{Bmatrix} = -\rho, \begin{Bmatrix} 2 \\ 21 \end{Bmatrix} = \begin{Bmatrix} 2 \\ 12 \end{Bmatrix} = \frac{1}{\rho}$, all others are zero

(c) $\begin{Bmatrix} 1 \\ 22 \end{Bmatrix} = -r, \begin{Bmatrix} 1 \\ 33 \end{Bmatrix} = -r \sin^2 \theta, \begin{Bmatrix} 2 \\ 21 \end{Bmatrix} = \begin{Bmatrix} 2 \\ 12 \end{Bmatrix} = \frac{1}{r},$

$$\begin{Bmatrix} 2 \\ 33 \end{Bmatrix} = -\sin \theta \cos \theta, \begin{Bmatrix} 3 \\ 31 \end{Bmatrix} = \begin{Bmatrix} 3 \\ 13 \end{Bmatrix} = \frac{1}{r},$$

$$\begin{Bmatrix} 3 \\ 32 \end{Bmatrix} = \begin{Bmatrix} 3 \\ 23 \end{Bmatrix} = \cot \theta, \text{ all others are zero}$$

5. (a) $r^2 \sin \theta \cos \theta; r^2 \sin \theta \cos \theta$

(b) $-\sin \theta \cos \theta; \cot \theta$

6. (a) $-r \sin^2 \theta; r^2 \sin \theta \cos \theta$

(b) $-r \sin^2 \theta; \cot \theta$

8. (a) $u^{\bar{y}}_{,k} = \frac{\partial u^{\bar{y}}}{\partial x^k} + \begin{Bmatrix} i \\ ks \end{Bmatrix} u^{\bar{y}}_i + \begin{Bmatrix} i \\ hs \end{Bmatrix} u^{\bar{y}}_s$; (b) $A^h_{\bar{y},k} = \frac{\partial A^h_{\bar{y}}}{\partial x^k} - \begin{Bmatrix} s \\ ik \end{Bmatrix} A^h_{s,j} + \begin{Bmatrix} h \\ ks \end{Bmatrix} A^s_{\bar{y}}$

10. $A^j_{k,q} B_n^{lm} + A^j_k B_n^{lm} {}_{n,q}$

11. (a) $\frac{1}{\rho} \left[\frac{\partial}{\partial p} (\rho A_p) + \frac{\partial}{\partial \phi} (A_\phi) + \frac{\partial}{\partial z} (\rho A_z) \right]; \quad (b) \frac{1}{r^2} \frac{\partial}{\partial r} (r^2 A_r) + \frac{1}{r \sin \theta} \frac{\partial}{\partial r} (\sin \theta A_\theta) + \frac{1}{r \sin \theta} \frac{\partial A_\phi}{\partial \phi}$

12. (a) $\frac{\partial^2 v}{\partial p^2} + \frac{1}{p^2} \frac{\partial^2 v}{\partial \phi^2} + \frac{\partial^2 v}{\partial z^2} + \frac{1}{p} \frac{\partial v}{\partial p} = 0 \quad (b) \frac{\partial^2 v}{\partial r^2} + \frac{1}{r^2} \frac{\partial^2 v}{\partial \theta^2} + \frac{1}{r^2 \sin^2 \theta} \frac{\partial^2 v}{\partial \phi^2} + \frac{2}{r} \frac{\partial v}{\partial r} + \frac{\cot \theta}{r^2} \frac{\partial v}{\partial \theta} = 0.$

L

- Linear differential equations, 471
 Linear transformations, 51
 Linear programming, 1061
 Graphical method in, 1064
 Simplex method in, 1072
 Line of greatest slope, 107
 Liouville's theorem, 701
 Logarithmic function, 664
 test, 377

M

- Maclaurin's series, 147
 M-method, 1082
 Matrix, 26
 Adjoint of a square, 33
 Characteristic roots of a, 55
 Conjugate of a, 67
 Elementary, 36
 Hermitian, 68
 Inverse of a, 33
 Null, 27
 Orthogonal, 55
 Rank of a, 35
 Singular, 26
 Skew-Hermitian, 68
 Skew-symmetric, 27
 Symmetric, 27
 Transpose of a, 27
 Triangular, 27
 Unitary, 69

- Matrix solution of equations, 43
 Maxima and minima, 177, 226, 986
 Mean deviation, 838
 Measures, of central tendency, 832
 of dispersion, 838
 Method, of false position, 920
 of Frobenius, 544
 of Group Averages, 823
 of least squares, 816
 of moments, 827
 of separation of variables, 429, 600
 of variation of parameters, 486

- Metric tensor, 1190
 Milne's method, 1022
 Milne-Thomson method, 679
 Mixed tensors, 1185
 Modified Euler's method, 1013
 Modulus, of a complex quantity, 640
 of elasticity, 458
 Moments, 843
 Moment of a force, about a point, 90
 about a line, 91

Moment generating function, 876
 Moment of inertia, 297
 Monge's method, 597
 Morera's theorem, 701
 Motion, of a fluid, 678
 under resistance, 503
 Multiplication of, determinants, 23
 matrices, 26
 vectors, 86, 95
 Mutually exclusive events, 858

N

Negative Binomial distribution, 892
 Neumann's function, 551
 Newton's, backward interpolation formula, 958
 formula for unequal intervals, 975
 forward interpolation formula, 958
 law of cooling, 466
 second law of motion, 458
 Newton-Raphson method, 922, 942
 Non-homogeneous linear partial differential equations, 596
 Non-linear partial differential equation, 584
 Normal, distribution, 884
 flux, 90
 to a surface, 219
 Normal forms, 1163
 Null hypothesis, 896
 Numerical, differentiation, 980
 integration, 989
 solution of equations, 916
 solution of ordinary differential equations, 1008
 solution of partial differential equations, 1040

O

Objective function, 1062
 Oblate spheriod, 130
 Odd function, 408
 Ogive, 831
 Ohm's law, 464
 Operator, del, 322
 difference, 946
 differential, 472
 logical, 1155
 Order of a difference equation, 998
 of a differential equation, 426
 Orthogonal spheres, 120
 system, 678
 trajectories, 454

transformation, 52
 Orthogonality of, Bessel functions, 559
 Legendre polynomials, 567
 Oscillatory series, 366
 Osculating plane, 317
 Outer product of two tensors, 1188

P

Parabolic equations, 1051
 Paraboloids, 128, 129
 Parseval's formula, 417
 identity,
 Partial, derivatives, 198
 differential equations, 577
 Particular integral, 472, 590, 1000
 Partition method, 41
 Pedal equation, 163
 Periodic functions, 395, 732
 Picard's method, 1008
 Point of Inflection, 177
 Poisson distribution, 883
 equation, 1048
 integral formulae, 702
 Power series, 385
 Predicates, 1161
 Predictor-corrector methods, 1022
 Principal axes, 301
 normal, 316
 Probability, 859
 Addition theorem of, 862
 Multiplication theorem of, 863
 generating function, 877
 Probability integral, 312, 886
 Probable error, 887
 Product of inertia, 300
 Projectile with resistance, 526
 Prolate spheroid, 130

Q

Quadratics, 126
 Quadratic forms, 64
 Quantifiers, 1161
 Quotient law, 1188

Raabe's test, 377
 Radio equation, 631
 Random variable, 871
 Rank, correlation, 853
 of a matrix, 35
 Ratio test, 373
 Rayleigh's power method, 943

Rayleigh-Ritz method, 1124
 Reciprocal equations, 7
 Reciprocal, tensors, 1190
 Recurrence formulae, 552, 566
 Reduction formulae, 239
 Reduction of quadratic form to canonical form, 64
 Regression lines, 848
 Regula falsi, 920
 Relation between roots and coefficients, 3
 Relations between the operators, 953
 Relaxation method, 940
 Repeated trials, 879
 Residue theorem, 710
 Resonance, 509
 Riemannian space, 1189
 Right handed and left handed systems, 77
 Rodriguez's formula, 563
 Rolle's theorem, 142
 Root mean square value, 418
 Roots of a complex number, 650
 Rouche's theorem, 46
 Runge-Kutta method, 1018

S

Saddle point, 226
 Sampling, 897
 Saw-toothed wave, 417
 Scalar product, of two vectors, 81
 of three vectors, 93
 Scatter diagram, 812
 Schwarz-Christoffel transformation, 692
 Series, alternating, 382
 Binomial, 668
 Convergence of, 366
 Exponential, 668
 Fourier, 395
 Geometric, 366, 668
 Gregory's, 668
 Jacobi, 556
 Laurent's, 704
 Logarithmic, 668
 Power, 385
 Solution of differential equations in, 542
 Summation of trigonometric, 668
 Taylor's, 704
 Set theory, 1149
 Set operations, 1151
 Shear force, 519

Shortest distance between two lines, 110
 Simple harmonic motion, 502
 Simple pendulum, 504
 Simplex method, 1072
 Simpson's rule, 990
 three-eighths rule, 990
 Simultaneous,
 differential equations, 496
 total differential equations, 540
 Singular point, 708
 Singularity, essential, 708
 Skewness, 843
 Solenoidal, field, 351
 vector function, 327
 Solution of, biquadratic equations, 11
 cubic equation, 9
 difference equations, 999
 differential equations, 426
 differential equations in series, 542
 equations graphically, 13
 Laplace's equation, 619, 1042
 non-linear simultaneous equations,
 942
 partial differential equations, 577
 Poisson's equation, 1048
 simultaneous equations, 929
 Sphere, equations of, 117
 Spherical co-ordinates, 359
 Spring, stiffness of, 458
 Oscillations of a, 507
 Stagnation points, 690
 Standard deviation, 838
 Standard error of estimate, 852
 Statistical inference, 897
 Stenier's theorem, 298
 Stirling's formula, 964
 Stoke's theorem, 341
 Straight line in symmetrical form, 102
 Stream function, 678
 Strum-Liouville problem, 573
 Strut, 519
 Student's *t*-distribution, 905
 Successive differentiation, 134
 Summation, of series, 668
 convention, 1181
 Surface integral, 337

Surface areas of revolution, 269
 Switching circuits, 1172
 Synthetic division, 2

Units, electrical, 463
 Systems of, 458
 Unit, impulse, 761
 step function, 756

T

Tangent plane, 119, 219
 Taylor's series, 704
 series method, 1010
 theorem, 145, 220
 Telegraph, equations, 631
 Telephone equations, 631
 Tensor, associated, 1192
 Conjugate, 1190
 Contravariant, 1183
 Covariant, 1184
 Fundamental, 1190
 Metric, 1190
 Reciprocal, 1190
 Symmetric, 1186
 Testing a hypothesis, 898
 Tetrahedron, 81
 Theorem of perpendicular axes, 298
 Thermal conductivity, 466
 Torsion of a curve, 317
 Total differential equations, 539
 Transformation, Bilinear, 685
 Conformal, 688
 Joukowski, 689
 Linear, 51
 of equations, 5
 Orthogonal, 52
 Schwarz-Christoffel, 692
 Transmission line, 630
 Transportation problem, 1097
 Trapezoidal rule, 989
 Triple integrals, 283
 Trivial solution, 48
 Truth value, 1176
 Two phase method, 1085
 Two-dimensional, heat equation, 618
 Laplace's equation, 619

U

Uniform, convergence, 389, 702
 distribution, 892

Validity of series solution, 542
 Variation of parameters, method of,
 486

Variance, 838
 Vector, acceleration, 319
 differentiation, 315
 field, 322

integration, 334
 products, 86, 95

Velocity of escape, 460

Velocity potential, 678

Venn diagrams, 1151

Vibrations, damped, 507
 forced, 509
 of a string, 602

Vibrating membrane, 626

Vogel's approximation method, 1099

Volterra equations, 1131, 1138

Volume integral, 345

Volumes of solids, 285
 of revolution, 286
 as double integrals, 285
 as triple integrals, 285

W

Wave, equation, 602, 1055
 forms, 417
 Weddle's rule, 991
 Weibull distribution, 893
 Weirstrass's M-test, 390, 702
 Whirling of shafts, 522
 Work, 90, 335
 Wronskian, 486

Z

Zero of analytic function, 708
 Z-transform, 793
 Application to difference equations,
 808

Higher Engineering Mathematics

Dr. B.S. Grewal

The book provides a clear exposition of essential tools of applied mathematics from a modern point of view and meets complete requirements of engineering and computer science students. Every effort has been made to keep the presentation at once simple and lucid. It is written with the firm conviction that a good book is one that can be read with minimum guidance from the instructor. To achieve this, more than the usual number of solved examples, followed by properly graded problems have been given. Many of the examples and problems have been selected from recent papers of various university and other engineering examinations. Basic Concepts and Useful Information has been given in an Appendix. However, the subject matter has been set in eight main units:

- **Algebra & Geometry** : Solution of equations, Linear algebra: Determinants, Matrices, Vector algebra and Solid geometry.
- **Calculus** : Differential calculus, Partial differentiation, Integral calculus, Multiple integrals, Vector calculus.
- **Series** : Infinite series and Fourier series.
- **Differential Equations** : Differential equations of first order and their applications, Linear differential equations and their applications, Differential equations of different types, Series solution of differential equations and special functions, Partial differential equations and their applications.
- **Complex Analysis** : Complex numbers and functions, Calculus of complex functions.
- **Transforms** : Laplace transforms, Fourier transforms and Z-transforms.
- **Numerical Techniques** : Empirical Laws and Curve fitting, Statistical methods, Probability and Distributions, Sampling and Inference, Numerical methods, Finite differences and Interpolation, Difference equations, Numerical solution of Ordinary and Partial differential equations, Linear programming.
- **Special Topics** : Calculus of variations, Integral equations, Discrete mathematics, Tensors.

An exhaustive list of 'Objective Type of Questions' has been given at the end of each chapter. Standard Tables, Answers to Problems, and a fairly comprehensive Index is given at the end.
